EXPERIMENTS WITH HUMOGEN (see p. 113).—I read with interest Dr. H. E. Durham's remarks on the effect of humogen. The use of lime in conjunction with bacterized peat in the Wisley experiments sometimes raised, sometimes depressed, the yield according to the sample of peat used. In no case was quite fresh slaked lime used—it had always been exposed to the air before use, and had therefore become more or less "mellow," to use Dr. Durham's term; indeed, in the 1916 series, lime had been added to the soil many months before, and had certainly become wholly converted into carbonate. (Lime was never added "during growth," as Dr. Durham says.) Here the results were worse than in any other series. But my main reason for drawing further attention to the Wisley trials is that Dr. Durham, in saying that the use of humogen has overlooked what is perhaps the most important point of all, the experiments in Series I. (1914) gave extraordinary results, equal to anything that has been secured elsewhere (see *Journal R.H.S.*, XLI., p. 320); Series II. and III. (1914) fell far short; Series IV. (1915) was somewhat inconclusive taken by itself; and in Series V. (1915) practically no effect was produced; while in Series VI. (1916) the effect was positively harmful! The evidence goes to show that humogen is not of even approximately constant composition; either variations have occurred in the initial peat substratum, in the cultures and materials added subsequently, or in the mode of manufacture, and the result is that at present humogen is not a standardised article, and can be used with profit only on an experimental scale. Assuming, as the results obtained suggest, that nitrogen is the active principle in the humogen, published analyses from various sources confirm the view which experiments in the garden have led us to adopt. Dr. Durham gives hardly sufficient particulars to enable one to gauge the meaning of the results he gives. If the experiment which he quotes with Plate 6, for instance, was the result of comparing one peat-dressed plot with one control plot, the 12 per cent. increase on the ridged land would probably mean nothing, for it would not be outside the probable bounds of differences due to uncontrollable causes. This seems the more likely in that on the "ridge-trenched" land the same dressing of humogen caused a depression in the yield of the same

variety of 12 per cent. Did the humogen (even though used at the high rate of two tons to the acre) really have any effect whatever? T. J. Chittenden.

R.H.S. AND THE PURCHASE OF BOOKS (see p. 127).—The majority of the Fellows of the Royal Horticultural Society will, I should say, uphold the action of the council in refusing to purchase expensive books at the present time, however rare they may be. Before condemning the Council, it should be borne in mind that horticulture is now passing through a very severe crisis. Perhaps, as the Rev. Joseph Jacob says, "the Council's ways want mending"; but this is not the time for it to commit itself to further outlay. It would be better in present conditions to reserve the money for any unexpected call upon the society's funds. As old books are the hobby of your correspondent, one can understand his looking upon the matter as of the first importance, but the Council has to consider the matter from a business point of view. *Cautious.*

MR. HENRY JONES, GARDENER FOR FIFTY YEARS AT CARROW HOUSE, NORWICH.

SOCIETIES.

ROYAL HORTICULTURAL

MARCH 27. As is to be expected, on the adjourned section, the fortnightly meetings of the above society at the London Scottish Drill Hall, Buckingham Gate, are assuming greater importance, both the number of exhibits and the number of visitors being on the increase. The Perpetual-flowering Carnation Society held its spring show in connection with the R.H.S. meeting, but the response was small, only four exhibits being forthcoming in eight classes. In the floral section of the R.H.S. exhibition, a fine feature was a group of Alpines, chiefly Saxifragas, from the Society's Gardens at Wisley. It is only on rare occasions that such superb pans of these beautiful spring flowers have been seen at the London shows; indeed, we doubt if the variety Gloria has ever before been shown so well. The flowers were as large as those of Primroses, and formed an unbroken sheet the width of the large pan. Very charming, too, were *S. ilacina*, *S. Irvingii*, *S. oppositifolia* and *S. o. splendens*, for which latter the Committee awarded a Cultural Commendation. Besides the plants in pans there were some delightful little specimens in pots, including *S. Bursiana* number 8, *Ilacina* and others. Perpetual-flowering Carnations, Cyclamens, Ferns, forced shrubs, and Boscs, comprised the remaining subjects. Four Boses were shown by Mr. ELSAETH HIRKS, who was exhibiting a new H.T. variety named Mrs. Elisha Hirks, flush pink in colour, deepening at the base of the petals to shell-pink. The bloom is long and pointed, of good shape, and has exceptional fragrance; it is borne on a stout stem, and the foliage is robust—altogether a Rose of great promise. From the Society's Gardens at Wisley there was a plant in bloom of Parrotia persica

(see fig. 47), which is very seldom seen in flower in this country, and aroused a good deal of interest. The inflorescence consists of a group of stems in stamens enclosed in brownish scales.

The largest group before the Narcissus Committee, which was also, incidentally, the largest and most prominent individual group in the hall, was exhibited by Messrs. R. H. BARN, LTD., and consisted of Tulips, Daffodils and Crocuses in bowls of fibre. The same firm also exhibited some excellent Daffodils in a separate group, and Daffodils were also shown by Messrs. J. R. PEARSON AND SONS. Both collections of Daffodils were remarkably good, of bright, clear colour and excellent form. In Messrs. BARN'S collection, the golden Trumpet variety King Alfred was represented by model blooms, with perfectly formed perianth of pale yellow, and short, wide, frilled trumpet of a deeper tone. Silver Dawn, Great Warley, Flame, and Lowtham Beauty were also well shown. The finest of Messrs. PEARSON'S varieties were Florence Pearson, Mme. de Graaff, Louise L. Linton, and Mrs. B. Farmer.

The Narcissus Committee recommended an Award of Merit to Narcissus Bonaparte for its value for pot cultivation.

As in the floral section, the Society's Gardens contributed the most interesting exhibit before the Fruit and Vegetable Committee. It consisted of Carrots and Beets which were lifted on the 26th inst. from sowings made on July 19 last. Notwithstanding that 36° of frost had been registered in the gardens, the roots were perfectly sound, and excellent in every respect. There were also from Wisley some Cabbages raised from seed sown on July 21 last, the varieties being First and Best and Harbinger.

At the 3 o'clock meeting of the Fellows, Mr. JAMES C. HOUSTON gave an address on "Violets and Violet growing."

Floral Committee.

President: Messrs. H. B. MAY (chairman), W. J. BISH, J. HADSON, R. C. NOTCUTT, J. GREEN, W. B. CUMMIFORD, G. ROUTH, J. HEAL, E. F. HAZELTON, W. HOWE, T. STEVENSON, C. E. PEARSON, J. F. M. LEED, J. DICKSON, C. E. SHEA, C. DIXON, A. TURNER, R. HOOPER PEARSON, C. ELLIOTT, W. P. THOMSON, E. H. JENKINS and W. G. BAKER.

Groups.

The following medals were awarded by the Floral Committee for collections:—*Silver Flora Medal* to Mr. J. C. JENNER, Rayleigh, Essex, for Perpetual-flowering Carnations; Messrs. SMART LOW AND CO., Bush Hill Park, Enfield, for Perpetual-flowering Carnations and Cyclamens; and Messrs. H. B. MAY AND SONS, Edmon-ton, for Ferns. *Bronze Flora Medal* to Messrs. R. TURNER AND SONS, Oxford, for Saxifragas. *Bronze Bursiana Medals* to Messrs. BARR AND SONS, King Street, Covent Garden, for Alpines and bulbous plants; Messrs. J. CHEAL AND SONS, Crawley, for Alpines and shrubs; Messrs. W. CUMMIFORD AND SON, Hitchgate, for Alpines and forced shrubs; Mr. ELSAETH HIRKS, Twyford, for Boses; Mr. G. W. MILLER, Wisbech, for spring flowers; and Mr. G. REITHE, Keston, Kent, for Alpines.

Orchid Committee.

President: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, and Messrs. Jas. O'Brien (hon. secretary), R. A. Rolfe, R. H. Thwaites, E. R. Ashton, T. Armstrong, A. McBean, J. Cypher, J. Charlesworth, J. E. Shill, H. G. Alexander, Walter Cobb, S. W. Floy, W. Bolton, C. H. Curtis, C. J. Lucas, R. Freeman White, and W. H. Hatcher.

AWARDS.

FIRST CLASS CERTIFICATE.

Cypripedium Erythrales The Baron (Hera Erythraea × Alabaudes), from Mr. J. E. SHILL, The Dell Gardens, Englefield Green. A noble flower, of large size, the markings and colour following *C. Hera Erythraea*. The dorsal sepal is white with an emerald-green base and heavy blotching of dark purple. The petals and lip are yellow-tinted and spotted with dark mahogany-red.

AWARDS OF MERIT.

Brassica Cateleya Lady de Rivers (B. C. Digbyana × S. arvensis × C. G. Colliana albens), from

Messrs ARMSTRONG AND BROWN, Tunbridge Wells. A white flower of perfect form, the sepals having a faint tinge of rose colour, and the broad fringed lip a yellow disc with a thin line of purple in front.

Sapbro-Laelia-Cattleya Mense var. General Nivelle (S.-L.-C. *Marathon* × *L.-C. callistoglossa*), from Messrs. CHARLESWORTH AND Co., Haywards Heath. A richly-coloured flower, of good size and shape, and by far the best of the three already shown. The broad sepals and petals are reddish rose colour, with a slight gold shade. The lip is crimson with yellow lines at the base.

Cattleya Enid var. Silver Queen (*Mossian Reineckiana* × *Warszewiczii* FROM M. *Boyardt*). Nearest to the fine *C. Enid* × *Lambeau*. The large flowers are pure white with yellow in the centre of the lip and purple lines in front. From Messrs. CHARLESWORTH AND Co.

Odontioda St. Quentin (*Oda Zephyr* × *Odm. Wiganianum*), from Messrs. FLOEY AND BLACK, Orchid Nursery, Slough. A distinct novelty, with large, pale-yellow flowers blotched with dark reddish-purple. The lip is bluish-white with a band of dark red in front of the yellow crest. The colour and disposal of the markings resemble *Odm. Wiganianum*.

GROUPS.

Mrs. BISCHOFFSHEIM, The Warren House, Stanmore (Orchid grower Mr. H. Haddon), showed *Brasso-Laelia-Cattleya Queen* of the Belgians, Warren House variety (B.-L. *Digbyana*-*purpurata* × *C. Mendelii* H. A. Tracy), bearing on a seedling plant a flower of fine shape and substance, of a deep rosy-mauve colour, with yellow disc to the lip.

C. J. LUCAS, Esq., Warnham Court, Horsham (gr. Mr. Duncan) sent three seedlings, viz., *Odontoglossum Delta* (*Rolfsee* × *Othello*), a very dark flower of the *O. Harryanum* class; *Odm. ardentisiper* (*ardentissimum* × *Jasper*), a fine flower handsomely blotched; and *Odontioda warnhamensis* (*Oda Cecilia* × *Odm. ardentissimum*), a good flower, dark bronzy-red, with white front and margin to the lip.

MESSRS. CHARLESWORTH AND Co., Haywards Heath, were awarded a Silver Flora Medal for a group containing a noble form of *Brasso-Cattleya Cliftonii*, with rich purple front to the fringed lip, the sepals and petals being bluish-white.

MESSRS. J. AND A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a group in which their specialities, hybrid *Cymbidiums*, were well represented by forms of *C. Gottianum*, *C. Alexandri*, etc., the latter being specially handsome, and varying in colour from pale yellow to rosy-lilac.

MESSRS. J. CYPIER AND SONS, Cheltenham, were awarded a Silver Banksian Medal for a group of spring-flowering *Dendrobiums*, in which the forms of *D. nobile* and hybrids of the *D. Cyclo* and *D. Apollo* class were profusely flowered.

MESSRS. ARMSTRONG AND BROWN, Tunbridge Wells, staged handsome *Odontoglossums* and *Odontiodas* flowering for the first time, including *Odontioda Cerens* Orchidhurst variety (*Odm. excellens* × *Oda Charlesworthii*), large, and of fine shape, Indian-red, with the tips of the segments clear light yellow; two plants of *Odm. Corona* (*Doris* × *ardentissimum*), the one white, blotched with purple, the other pink with more profuse purple spotting, and both very attractive.

MESSRS. FLOEY AND BLACK, Orchid Nursery, Slough, showed the original *Laelio-Cattleya Invincible Orama* which secured an Award of Merit in 1912, and which is still one of the best of its class.

MESSRS. SANDER AND SONS, St. Albans, exhibited a group of good *Laelio-Cattleyas*; *Cymbidiums*, including *C. grandiflorum* and other showy Orchids. The two best were *Brasso-Laelio-Cattleya Wotan var. callistoglossa* (B.-C. Mrs. J. Leemann × *L.-C. callistoglossa*), one of the largest of the *B. Digbyana* crosses, rosy-lilac, with effectively raved yellow lines from the base to the centre of the lip; and *Miltonia Beuana* General Joffre, a very large bluish-white flower with purple fleure on the bases of the petals and lip.

Narcissus Committee.

AWARD OF MERIT.

Narcissus Bonaparte.—A variety of the *Incomparabilis* type, recommended for award on account of its suitability for forcing in pots. The flower has a flatish perianth of sulphur-yellow, and a broad, short-frilled trumpet of a richer shade. There were about 12 good blooms in each pot, carried well above the foliage, which was stout in substance and not inclined to droop.

FIG. 47.—FLOWERING BRANCH OF *PARROTIA PERSICA*. (See p. 137, col. 2.)

GROUPS.

The Narcissus Committee made the following awards:—*Silver-gilt Flora Medal* and *Silver-gilt Banksian Medal* to Messrs. R. H. BATH, LTD., Wisbech, for Tulips and Daffodils, respectively. *Silver-gilt Banksian Medal* to Messrs. J. R. PEARSON AND SONS, Loddham, for Narcissus.

Fruit and Vegetable Committee.

Present: Mr. J. Cheal (chairman), Rev. W. Wilks, Messrs. E. A. Bunyard, W. H. Divers, P. D. Tuckett, J. C. Allgrove, P. Veitch, J. Harrison, E. Beckett, O. Thomas, W. Bates, W. Poupart, E. R. Allan, F. Jordan and A. Bullock.

Obituary.

GEORGE KERSWELL. We regret to learn that Mr. George Howe Kerswell, nurseryman and fruit grower, of St. Thomas, Exeter, died of apoplexy on the 17th inst., at the age of 75. Mr. Kerswell was a successful grower of *Gentians*, and was in the habit of showing them at the fortnightly meetings of the Royal Horticultural Society.

ANSWERS TO CORRESPONDENTS.

BERBERIS LEAVES EATEN BY MARE: *G. H. N. II.* As we presume, the leaf sent is that of *Berberis Aquifolium*, it is not known to be poisonous to animals. The root is used in the United States, and to some small extent in this country, as a tonic. As regards the action of the active principle, *Berberin*, upon animals, when administered in large doses, poisonous symptoms have been produced. It is possible that the prickles may have set up intestinal inflammation.

EUCALYPTUS UNHEALTHY: *T. J. II.* There is no fungus or insect pest present in the leaf of *Eucalyptus*. The colour changes are probably preliminary to the gradual death of the leaf, which is resulting apparently from some cultural fault.

GARDENING ENGAGEMENTS: *F. C. K.* and *E. R.* See reply to *M. S.* on p. 130 in the last issue.

VINES FAILING: *J. A.* Unless the roots of the four-year-old Vines had been restricted and special cultivation had been provided so as to cause them to ripen early, 65° was 10° too high for the night temperature during such weather as has lately prevailed. That the heat has been too much for the amount of daylight received is proved by the fact that the internodes immediately above and below the abortive bunches measure 4, and even 5 inches in length, whereas they only ought to be 3 inches at the present time, and those lower down the laterals should be much shorter. The stems are also lacking, not merely in size, but in substance, from the same cause.

NAME OF FRUIT: *Count. Gosset* Apple.

NAMES OF PLANTS: *J. H. L.* 1. *Odontoglossum crispum Lehmannii*, a local form almost intermediate between *O. crispum* and *O. Pescatorei* and very variable in the shape and markings of the flowers; 2. *Odontoglossum luteo-purpureum*; 3 and 4. *Cyrtopidium Lucie* (*ciolare* × *Lawrenceanum*); 5. *Cyrtopidium Calypso* (*Boxallii* × *Spicerianum*); 6. 7. and 8. *Cyrtopidium Lathamianum* (*Spicerianum* × *villosum*); 9. *Cyrtopidium pavoninum* (*venustum* × *Boxallii*).—*Somerset*. 1. *Saxifraga granulata flore pleno*; 2. *Eupatorium* species; 3. *Neprolepis exaltata elegantissima*; 4. *Eranthemum pul-hellum*; 5. *Asplenium Trichomanes* (*Maidenhair Spleenwort*, British); 6. *Ceterach officinarum* (*Scaly Spleenwort*, British).

ONIONS NOT KEEPING: *H. B.* The Onions are attacked by *Onion Sclerotinia* (*S. bulborum*). The black growths (like little seeds or warts) on the top of the bulb are masses of the spawn of the fungus in a resting stage. The land where the crop was grown will be infected, and should not be planted with Onions for at least three years.

PEACH SHOOTS DISEASED: *West Argyllshire.* The Peach shoots are attacked by *Botrytis*, see reply to *A. L. Henley*, in the issue for March 17, p. 120.

POTATOS: *East Kent.* The tubers are severely affected with winter rot (dry rot), caused by the fungus *Fusarium*.

POTATOS FROM A TWELVE-ROD PLOT: *S. P.* Seeing that your plot is approximately 12 rods, your estimate of a crop of one ton of Potatoes is a liberal one, but not excessive. In rich soils, with suitable manures and good cultivation, a crop of over 2 cwt. per rod is sometimes possible.

CLIMBING PLANTS

(Present-Day Gardening Series)

By **WILLIAM WATSON.**

(Introduction by William Robinson.)

A Practical Handbook on the Treatment of Climbing Plants, both hardy and tender species. Illustrated with 24 full page plates, 8 of which are reproduced in colour.

Price 2/10 post free from:

The PUBLISHING DEPT.,

"GARDENERS' CHRONICLE" OFFICES, 41, Wellington Street, Covent Garden, W.C. 2

THE ROCK GARDEN

A practical work on the cultivation and management of Rock Gardens, written by Reginald Farrer. One of the best and most popular works on the subject.

Contains 5 plates in colour. Price 1/10 post free.

THE PUBLISHER,

The Gardeners' Chronicle, Ltd., 41, Wellington Street, Covent Garden, London, W.C. 2.

ONLY OBTAINED TO ORDER.

IN consequence of an Order of the Board of Trade prohibiting publishers from taking back from retailers unsold copies of any newspaper or journal the **GARDENERS' CHRONICLE** will only be obtained to order in future. Fill in and despatch to your newsagent **AT ONCE** the form given below, as you will now find it impossible to obtain a copy at short notice by any other means.

To Newsagent.

Address

Please deliver to me each week, at the address below, a copy of the **GARDENERS' CHRONICLE** until further notice.

INSECTICIDES.

It seems probable that there will be a demand for British-grown fruit this year at prices far in advance of those ruling hitherto, and it will pay well to get the utmost yield possible from every acre of orchard and fruit cultivation. One reason why Canadian and Tasmanian fruit is appreciated so much in this country is the perfect condition of each individual fruit, a result partly due to the very thorough methods taken to prevent damage by insects. These methods are in some districts compulsory. Whilst fruit grown here is rarely perfect, that which is imported is so to an extent wholly unknown in this country.

The use of insecticides is a practice that contributes to perfect fruit to an extent only realised when one compares properly sprayed fruit with fruit from trees not sprayed. I propose to discuss the matter from the point of view of the man who has a sprayer and wants to make what spray-fluids he needs himself. Some years ago I helped to spray on a plantation with a mixture of nicotine, quassia and soap, costing 10s. a hundred gallons; it was found to kill about 40 per cent. of the Apple suckers. A mixture described below was substituted, costing 4s. to make, and it killed 90 per cent. every time.

In all insecticides there are two things to think of, whether the liquid will wet the plant or insect, and whether it will then poison or kill the insect. For instance, for a caterpillar you must first have a liquid that will wet the leaves, and then add the poison that is to remain there and kill the caterpillar when it feeds; for some insects you have to think of another point, whether the liquid will dissolve the waxy covering after it has wet it. Thus, for woolly aphid of the Apple, you want a wetting ingredient, a wax-dissolving ingredient and a poisoning ingredient. For wholesale use it may pay to use an insecti-

cide made to kill a special insect, but in general the best plan is to have a standard wetting mixture, and to add to it ingredients to poison or dissolve wax of the various pests.

STANDARD WETTING MIXTURES.—Three formulæ are given, of which the second may be impossible in the present scarcity of potash (soft) soaps. All the more valuable will be the resin-soap formula.

1. Resin, block or lump, 8 lb.
- Washing or crystal soda, 8 lb.

Dissolve the soda in 3 gallons of water, in a vessel capable of holding at least 10 gallons; boil it, and add the resin roughly powdered, a little at a time, while it boils. When all is dissolved add water slowly till it makes 10 gallons. This is resin stock solution, and should be diluted with nine times its quantity of water.

2. Soft soap, 10 lb.
- Water, 100 gallons.

Dissolve the soap in 10 gallons of water and dilute 1 in 10. Use rain or soft water.

3. Bar or hard soap, 7 lb.
- Water, 100 gallons.

WINTER WASHES.—In view of the R.H.S. trial made in 1914-1915, it is only necessary to give an excellent formula.

4. Make formula 1 and add 1 quart "creosote oil" to the stock solution. Dilute at 1 gallon to 7 with water. Spray tree-trunks before the buds open. "Creosote oil" is usually obtainable from ironmongers; it is a black oil smelling like tar. In some places you can get crude disinfectant fluids that make a milky mixture with water; these will do just as well if used at 1 quart to 4 gallons of water, but are usually more expensive. The object of a winter wash is to clean trunks and branches of moss and of wintering insects. The best winter washes under proprietary names were tested by the R.H.S. in 1914-1915.

CATERPILLAR WASH.—Lead arseniate is the safest substance in use for killing caterpillars and such insects as weevils; it is put on with a wetting solution, and poisons the insects when they feed. It is also used against Codlin Moth, spraying the flower trusses just after the petals fall. As in some years we lose over 60 per cent. of the fruit from this pest, a little arseniate put on at the right moment is a useful help. Lead arseniate is sold by firms in paste form; the only question, then, is, how much water is in the paste and whether the grower is buying too much water. It is easily made with a lead salt such as lead acetate or nitrate and sodium arseniate.

5. Sodium arseniate, 1½ lb.
- Lead acetate or nitrate, 3½ lb.

Dissolve each separately in water; mix in a barrel to, say, 30 gallons with cold water. Take 1 gallon of this and 1 gallon of Formula 1—resin stock solution or Formulæ 2 or 3, and make up to 5 gallons; spray at once. The lead arseniate-liquid in the barrel must be well stirred up before mixing with the wetting solution, as it settles down.

An alternative, and one that is particularly valuable as a general protector of all fruit trees and plants against biting insects, is lead chromate, which I personally hold is the most valuable insecticide we have. It is made like the last, substituting

6. Potassium bichromate, 2½ lb.
- Lead acetate or nitrate, 5 lbs.

It forms a brilliant yellow liquid that is mixed and used in exactly the same way as described in the previous formula. The yellow chromate will remain on the foliage for months. If made as above it is entirely harmless to plants, and it is an excellent protector.

7. APPLE SUCKER WASH.—It is against sucker that growers waste much money on nicotine and the like. If only, after spraying, they would pluck a truss and count the live and dead suckers in it, they could test the effectiveness of their spraying. The best results obtained in a series

of trials in Middlesex were got by adding 1 quart of creosote oil to any of the three wetting mixtures 1, 2 or 3, described above, and spraying with a coarse driving spray at the trusses.

WOOLLY APHIS.—This is a pest that needs a wax solvent ingredient as well as a killing one. The best is carbon tetrachloride, obtainable at any chemist's, but methylated spirits or petrol will do at a pinch. To 3 gallons of the Formula 1 stock solution, or Formula 2 or 3 strong solution, add 1 pint of carbon tetrachloride and 1 oz. of "creosote oil." Dilute 1 to 7 with water and use as spray.

The grower will find here a new insecticide in carbon tetrachloride. There are a number of such not yet obtainable, but any competent chemist can get this liquid. It has the advantage of being non-inflammable.

Woolly aphid is easy to dispose of if one can get at the colonies quite early. One can do a great deal with a paint brush or a small sprayer then, and avoid extensive damage later on.

8. RED SPIDER ON GOOSEBERRY.—The one essential thing for this pest on Gooseberry is sulphur and a wetting wash. The best plan is to take 3 lb. flowers of sulphur for every 10 gallons of Formula 1 resin stock solution and stir it well in the stock solution while it is hot, then dilute 1 to 8 and spray lightly over the bushes.

APHIS OR GREEN FLY.—For all forms of green fly and black fly the safest thing is a plain wetting wash such as either of our first three, with nothing added. The ideal wash for black fly on Beans is yet to be found, in my opinion, and it is not at all easy to do anything with it once it has got a hold. The same applies to Plum green fly. Any spraying to be done must be early, when the first colonies start.

OTHER PESTS.—It is an advantage to know just when to spray so as to get a pest in an easy stage. I once got, I believe, every single one of hundreds of brown scale on Currant by spraying just as the young insects that winter on the shoots and buds had begun to stir on the first spring day. I was trying "miscible oil" sprays at the time, and out of hundreds of scales on shoots I examined, not one was found alive. Mussed scale is a very easy pest to kill, if one sprays almost any wash on the bark and branches in June, just when the young insects are out.

Growers accustomed to spraying may wonder why I have made no mention of nicotine, quassia or paraffin. The first cannot be got except in the form of some proprietary wash, and it is obviously impossible to refer to these; the second can be extracted from quassia chips, but I have never personally understood how it worked or what it did; the third is excellent if you can get the right oil and emulsify it, but as this is impossible now I omit reference to it. Growers will find this year that the supplies of many insecticides may be precarious, or that they have been varied in composition. A miscible form of the proper grade of mineral oil is an excellent insecticide, but such cannot be generally obtained at present except as proprietary washes.

It is worth considering whether in every garden, orchard and plantation the principle of having on tap, so to speak, a harmless wetting liquid, to which can be added lead chromate, or sulphur, or creosote oil, will not make washing and the treatment of all pests very easy. In all round gardening the "wetting liquid" serves for dipping pot plants, for washing Rose trees, for touching mealy bug or scale, for washing white fly or root mealy bug, for spraying orchards, and by having one basis for all outdoor mixtures, the proper wash for every pest is very readily and easily made. It is also an economy, and this year the economical production of the maximum of saleable produce is a duty, as well as a source of profit. H. M. Lefroy.

ORCHID NOTES AND CLEANINGS.

NEW ODONTIODAS.

ODONTIODA BRASINATOR (Oda. Bradshawiae × Odm. Fasciator).—Mr. Jas. Smith, Orchid grower to the Duke of Marlborough, sends flowers of two forms of the above cross. One is small, with dark red flowers. There are whitish markings on the petals; the lip is cream-white at the base and rose-coloured in front, with a large chestnut-red blotch in the centre. The larger form has broad sepals and petals of a deep reddish scarlet colour and a lighter red lip with yellow crest.

ODONTIODA BIX (Oda. Vuylstekeae × Odm. Rolfeae), from C. J. Phillips, Esq., The Glebe, Sevenoaks, is, in its present stage, a small but pretty flower. In colour and markings it is nearest to Odm. Rolfeae, but has a decided tinge of violet-purple on the sepals and petals. The lip is broad and finely formed, showing the influence of Odm. Prescotti which took part in the production of both parents.

ODONTIODA BORHAM (Oda. Charlesworthii × Odm. Vulcan) has flowered with Mr. Phillips for the first time.

COTONEASTER HUMIFUSA.

Grows naturally from seed or cuttings. *Cotoneaster humifusa* (syn. *C. Dummeri*) is a perfectly prostrate plant, which roots freely wherever the branches come in contact with the soil. It is invaluable for covering a sloping bank or overhanging rockwork.

This *Cotoneaster* is covered in autumn and winter with bright scarlet, almost spherical berries, but these can only be seen to advantage on a grafted plant. A good strong stock should be selected of one of the common species like *C. frigida*, and the grafts inserted four to six feet from the ground.

In the case of the plant illustrated, which is growing at Aldenham, the stock is forked and the prostrate form grafted on each of the branches. In this way the best effect is obtained from the cascades of blossom in early summer, and brilliantly coloured berries in autumn and winter.

NOTICES OF BOOKS.

A NEW GARDENERS' DICTIONARY.*

As stated on the title page, this dictionary is based on the original edition of 1846 of *Johnson's Cottage Garden Dictionary*, but some of the features of that classical work might well have been left out or modified, especially some of those relating to classification and geography. Few of us could now classify a collection of plants according to the Linnean Sexual System, and many of us have never learned it; yet it is retained for the older portion of the enumerations, together with the Natural System of Lindley. Additional genera are not thus classified, the sexual system being omitted, and some variations in natural methods introduced. Geographical terms have undergone little or no revision; some of those employed seventy years ago are now obsolete, and almost unknown. Taking the genus *Acacia*, we find some species recorded from New Holland, others from Australia, others from Van Diemen's Land, others from Tasmania, others from Swan River, King George's Sound and Western Australia respectively. Abbreviations are used throughout the volume, but they are not explained, either at the beginning or at the end. Specialists may understand what is meant by G.C., W.G., B.M., B.R., M.D.G., L., and the rest; but the majority of purchasers would not. The figures denoting

stature are more easily understood, once a clue has been obtained. As to the claim on the title page that the work has been brought down to 1917, it would have been better to let it rest at 1910, as in the preface. There are names enough; a rough approximation giving some 35,000, including synonyms. Each generic name stands in black type, followed by its etymology, family, and other particulars, including cultivation. Species are classified according to duration and alphabetically, with English equivalents of the names, height, flowering period, colour, native country, date of introduction and place of publication of many of the additions. Although the book cannot be called a critical compilation, it will be very useful to the gardener who cannot afford a more expensive work. From the foregoing description he can form an idea of the nature and scope of the work and the kind of information it contains. "Critical species or forms of minor importance, having no

FIG. 48. COTONEASTER HUMIFUSA AS A GRAFTED PLANT ON STANDARD.

horticultural value, have been omitted; also most of the hybrids, which are not likely to have any permanent value." This unfortunately excludes the results of one of the most attractive branches of gardening, claiming now an equal right with any other for recognition. Yet two columns of text are devoted to "Hybridising and Crossing." Returning to names. Of many genera they are overwhelmingly numerous, mostly without any aid to selection for small or moderately large establishments. Reckoning the columns of names at 50 each, there are at least, of *Pelargonium*, 750 species; of *Acacia*, 250; of *Rosa*, 500; of *Mosses*, 300; of *Erica*, 550; of *Rhododendron*, 250; and of *Dendrobium*, 450. With the exception of *Acacia*, no guide is given to the selection of the best species for various purposes. Though falling short of what it might have been under more drastic revision, this new edition of an old companion is well worth the young gardener's

attention and money. Apart from the defects pointed out, it is exceedingly well edited. The typography is good; the paper is good; the volume bound in cloth boards, weighing only 2½ lbs.—a consideration in these days of over-mineralised papers. W.

FORESTRY.

SPRING IN THE WOODLAND.

THE present month will be a busy one with the forester who is anxious to be abreast of his work and determined to carry it through in the most efficient manner. Not only will there be the felling and haulage of timber, but fencing and drainage of woodlands, nursery work, and preparation for bark stripping will all require a fair share of attention.

Never before in the history of our country has so large a quantity of home-grown timber been felled and converted as during the past two years, and the energies of our woodmen are being taxed to the utmost. Sales of trees have been numerous. The dry, frosty weather of early spring was suitable for the removal of heavy timber from woods and plantations, and vast quantities have found their way to our collieries and for war purposes to France and Flanders.

The fencing of woodlands from which timber has been removed should receive attention before farm stock is turned out; while the removal of debris from open ditches is imperative for the health of the crop of trees. Equities are being already made for Oak and Larch bark, and with every probability of a substantial advance in price, the revival of an almost obsolete industry of our woodlands is much to be desired.

Before the war the best class of Oak bark did not realise more than £2 12s. per ton, but last season fully £7 was the selling price, and there is every probability that £10 will be reached for well-harvested Oak bark during the coming summer.

As the season of bark-stripping is of short duration every preparation should be made beforehand, trees marked and numbered, tools in readiness and spades arranged so that an early start may be made, as by deferring the work beyond the proper time there is not only a perceptible loss in weight, but considerable deterioration in the quality of bark as well. In most cases the time when the land is just expanding into leaf is that which gives the greatest weight of bark of the best quality and with the smallest amount of labour.

In the home nursery all vacant ground should be trenched or dug over, and where the soil has become exhausted by frequent croppings the application of some thoroughly decomposed manure or leaf soil will greatly assist in the production of healthy stock. By April seed beds should be formed and seeds of the various forest trees that it is considered advisable to propagate in that way may be sown in thoroughly pulverised soil. Turn heaps of rotting weeds, and add a small quantity of fresh lime.

Ground work of all kinds should be pushed forward, hedges planted and shrubberies dug over and pruning resorted to where necessary. Though a dry March is a nurseryman's season for the preparation of his seed beds, and the sowing of a great part of his seeds, yet no attempt should be made to get upon the land intended for this purpose as long as the soil adheres to the feet, as the result is generally an unkindly and unfavourable seed bed.

Coppice felling should proceed rapidly, as with favourable weather an early shoot from the stools may be looked for. Firewood should be stacked or lotted for disposal, branches made into faggots for firelighting, and the manufacture of charcoal, for which demand is good, carried out wherever surplus rough timber is available. A. D. W.

* *Johnson's Gardeners' Dictionary and Cultural Instructor*, Edited by J. Fraser and A. Hensley 8vo, pp. 923. A new edition, based on the original edition of 1846, revised and brought down to the year 1917. (London: George Routledge & Sons.) Price 12s. net.

VEGETABLES.

A METHOD OF CROPPING.

The plan illustrated in fig. 49 shows a method of cropping a ten-rod plot suitable for Scottish growers. It will be seen that half the area is devoted to Potatoes, and the remainder to other useful vegetables, including Onions, Leeks, Carrots, Beet, Turnips, Beans, and green vegetables. The Parsnip, a very useful winter food crop, is represented by one short row, whereas Turnips, which possess much less food value, are allotted five rows. The reason for this may be that Parsnips occupy the ground for the whole of the year, whilst Turnips, Beet and Carrots can be succeeded in the same season by other crops, such as Celery and winter greens. It will be noticed that the practice of intercropping Cabbages with Broad Beans is recommended, but the plan makes no provision for intercropping Potatoes with Brussels Sprouts or Kales, which is often done by amateurs, but not always with success.

MAINCROP POTATOS.

THE notes on pp. 114 and 125 on the planting of maincrop Potatoes particularly interested me. In this neighbourhood the belief exists that, unless Potatoes are allowed to remain in the ground for a considerable length of time after maturing, their table qualities are not brought out to the full. Last season the farmers and small-holders in this district were digging well into, and even at the end of, November, which seems to me to be nothing short of courting disease. I know that it is impossible for many men to dig their tubers earlier when other crops, such as Corn, have to be attended to, threshed, and marketed. Last season I lifted two patches of Potatoes, one of the Factor and the other Up-to-Date, on August 5 and 4 respectively, which were planted on March 21 and 27, sprouted seed, and I was looked upon as being more or less mad for turning them out so early. Both varieties showed signs of having completed their growth and ripening, and yielded splendid crops, and the skins rubbed a little. The tubers were stored in a cool shed on an earth bottom and kept remarkably well, and we used them up to Christmas. Those of Up-to-Date were of good table quality, and my only regret is that I did not reserve some for cooking now. The Factor is of inferior quality here. When I first came here a gardening friend told me that, unless I sprayed, I should not have a crop to keep. I made enquiries, and found that Potatoes in these gardens were never sprayed. A short time ago I was in conversation with a farmer who, on the whole, grows Potatoes very well, but whose crop was badly blackened with disease last season. I asked him if he sprayed, and he said, "No." He sprayed once, and could see no benefit; so he has come to the conclusion that he fares as well as other people with his crop.

The farmer in question also told me that he saved his own seed every year, but rigorously selected it, which he cuts and plants in a perfectly dormant state, the seed being not more than 15 inches apart. He also stores his tubers under cover, a system which has much to commend it, inasmuch that they may be examined during inclement weather, and certainly they keep well, for I had the pleasure of eating some which were veritable balls of flour. He also guarantees that a sack of Potatoes, lifted and weighed in October will weigh the same the following July. *E. B., Fota Gardens, Queenstown*

PARSNIPS

In his search for a "stable basis" of comparison between one food crop and another, Mr. Simmons (p. 125) rightly insists upon taking into consideration the time a crop requires to grow, and in doing this he gives figures that place the Parsnip very low down in the list of

food-yields per unit area. Are not his figures somewhat misleading? A crop of 12 tons from an acre of Potatoes ready to lift in time to sow Beet, etc., as a following crop is rarely secured, though it is not impossible, as the records of the Wisley trials (*q. R.H.S. Journal*, XL1, p. 290) show, but surely a yield of 8 tons of Parsnips

the only factor in the production of high yields of Potatoes. Now the calorie-yield of Potatoes per pound is about 440, of Parsnips 240, or in the proportion of 11 to 6. The gross yield, on the assumption of a 12-ton Potato crop and a 16-ton Parsnip crop, will be as 152 to 96, nearly enough the proportion of 1 to $\frac{2}{3}$, given in

§ suggests, for we ought to take into consideration the energy expended in obtaining the crop, and place that on the debit side of our account.

Since the area cultivated (say 1 square rod) is the same under both crops, we may ignore interest (that is, rent, rates and taxes) on the capital represented by the land, and state our expenditure in energy rather than in money. It would be interesting to put the facts into figures, but they would vary so much in different cases that little purpose would be served.

To secure the Parsnip crop cost the energy expended in digging the ground after the previous crop, raking down, drawing drills, sowing, thinning, occasional hoeing, lifting when required, and the food value represented by 1 oz. of Parsnip seed, which meant the energy contained in (say) $\frac{1}{4}$ lb. Parsnips and expended in harvesting, cleansing, and distributing the 1 oz. of seed. What energy must we debit for the Potato crop? Its cost was the energy expended in digging the ground, raking down, making drills or furrows, setting, hoeing, earthing-up, lifting and storing; in making and carrying the manures, both natural and artificial, and their application; in lifting, grading and selecting the (say) 10 lb. of seed, its carriage from Scotland, and its sprouting, preparation, and carriage to the planting place, and possibly in securing, making, and applying sprays against disease; heavy items these, though probably not enough where an acre-crop of 12 tons of early Potatoes can be obtained to offset the Potato from its position as the premier food-yielder. Put also in the balance the greater certainty of the Parsnip as a crop, and the margin is but small.

Beet, if people will but eat it as a vegetable, will run the Potato even closer, and the Jerusalem Artichoke will not be far behind it, and probably ahead of the Parsnip. These four crops seem to give the greatest net returns of any of our garden crops. They are available over a long period and provide variety both in flavour, in mode of presentation, and in the kind of foodstuff contained—in the Potato, starch; in the Beet, cane sugar; in the Jerusalem Artichoke, inulin—a kind of soluble starch; in the Parsnip, both starch and sugar. *F. J. Chittenden.*

TO OBTAIN THE MAXIMUM YIELD.

MANY growers who have only a small area of ground do not realise the fact that the depth and height belong to them, and that by deep tillage of the soil and a proper method of training, much more produce can be obtained than is generally imagined. Take the case of the Runner Bean, which is a deep-rooting plant, and much appreciates a deep, well-enriched soil. By training the shoots to a good height and allowing the plants plenty of room, the produce may be doubled or trebled. They should be allowed to grow 10 to 14 feet high, which means that a much less quantity need be grown than when they are given shorter supports. This is a great gain, as it enables one to use the ground thus set free for other crops. The same applies to many varieties of Peas. Many root crops, such as Parsnips, Carrots, and Beetroot, give a much greater weight of produce when the plants have a deep and inviting rooting medium. *Edwin Beckett*

THE VALUE OF THE LEEK

COTTAGERS and other owners of small gardens in the South do not cultivate the Leek or recognise its great value as a vegetable. When well cultivated after the manner advocated by Mr. Beckett, carefully cooked and served, its best qualities are fully developed, and once these are realised they can scarcely fail to be highly appreciated. The hardy nature of the plant increases its value, as the most severe frosts in no way injuriously affect it. During the first week of February, on three consecutive nights 29°,

32°, and 28° of frost were registered in these gardens, and only the points of the leaves were affected, whilst all other exposed green vegetables, including hardy Kales, with the exception of Spanish Beet, were spoiled to such a degree as to be past recovery.

From the commencement of the war vegetables have been sent to the Navy from these gardens, and the Leek, in its season, has helped much in furnishing a supply. In most large gardens there is usually a surplus of Leek plants at the time of planting the main crops, and the distribution of these amongst the occupiers of small gardens who may be in need of them would ultimately make an agreeable addition to the supplies of the kitchen, and undoubtedly, if made good use of, educate inexperienced receivers as to the utility of cultivating this estimable vegetable. *Thos. Coomber, The Hendre Gardens, Monmouth.*

DWARF BEAN MASTERPIECE.

I AM growing this excellent Bean somewhat extensively this year, both under glass and in open borders. The individual pods are of a beautiful green colour, abundantly produced, and extremely fleshy. The Beans keep tender for several days after certain other varieties become stringy and unusable. I have not attempted to force this variety very early, but with moderate forcing and making use of the sun heat by closing the house early and promoting plenty of atmospheric moisture, its behaviour has been very satisfactory. I grew Masterpiece in the open last year by the side of several other varieties, and was well pleased with it.

WAXPOD BEAN MONT D'OR.

I HAVE grown this variety for many years for its tender, golden pods, and in the majority of seasons with good results. For a change from the ordinary varieties, when gathered quite young, the pods are much appreciated. The plants should be allowed ample room and a good position, as they are not so hardy as the green podded varieties. By sowing at intervals, a constant supply of tender pods may be had for several weeks during the summer. *H. Markham, Wrotham Park Gardens, Barnet.*

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor.

CUCUMBERS.—Plants which were raised early in the season will now be producing fruit, and should receive careful treatment with regard to thinning and stopping the young shoots. Side shoots may be stopped at the first or second joint beyond the fruit, according to available space, and all worthless growth removed while quite young. Old, rough leaves should also be removed, as these harbour Red Spider and other pests. Top-dress the bed with small quantities of fresh soil as often as the young roots appear through the surface. Syringe the foliage twice daily during sunny weather, and maintain a temperature of 70° by night, rising to 85° by day in sunshine. Very little ventilation will be necessary, provided the fire heat is stopped early in the day.

HERBS.—The present is a good time to make new beds of Tarragon and Mint. Tarragon roots may be split into small pieces with three or four eyes and planted 2 feet apart on good rich soil. The best way to make a Mint bed is to plant green shoots when a few inches long on ground which has been prepared some time before. The soil should be light and rich. The cuttings may be planted one foot apart with an ordinary dibber. By this method, good strong roots will be available for forcing next winter, as well as

a full supply throughout the summer and autumn. New plantations of Thyme may also be made now. If seedling plants are available, they should be planted 18 inches apart each way on good rich soil. Sage may easily be increased by inserting cuttings 18 inches apart about the middle of April. The cuttings should be removed from the old plants before much young growth has been made. Sweet Basil and Marjoram should be sown in a temperature of 60°, and the seedlings pricked into boxes of rich soil as soon as large enough to handle. If planted on a warm border in June, they will produce large quantities of green leaves throughout the summer and autumn. The Marjoram may be lifted and potted in September for winter use. Chervil should be sown frequently throughout the summer in order to maintain a continual supply of green leaves.

SPINACH.—Make frequent sowings of Spinach throughout the season, and select a cool position for the crop. At Frogmore we sow weekly in pits throughout the summer months, and give a free supply of water at the roots. New Zealand Spinach makes a good substitute for ordinary summer Spinach in hot, dry seasons. If sown about the end of April in drills four feet apart, it will soon cover the ground and produce a large quantity of green leaves. Winter Spinach has suffered seriously from the recent cold winds, and should be encouraged to make fresh growth by stirring the soil between the rows with a hoe. Spring-sown Spinach which is just showing through the surface may be encouraged in the same way. If slugs are present amongst the seedlings, they should be destroyed by frequent dustings of soot.

MATIF.—Plants raised from seed in the beginning of March should be potted into small pots before they become drawn. Grow them in a temperature of 60°, and not them into six-inch pots as soon as ready. These plants should be kept as near the roof glass as possible.

TURNIPS.—A sowing of Early Milan and Snowball Turnips should be made at once. Snowball will become fit for use by the time Milan is finished. If fortnightly sowings of Snowball and White Model are made, there should be no scarcity of young roots throughout the season. As the season advances, a cooler situation may be selected for them. Allow 18 inches between the rows, and thin to 9 inches in the rows as soon as the seedlings are large enough. Dust the crop with sifted wood ashes, and protect it from birds as soon as the young plants show through the surface.

WINTER GREENS.—Sowings of Kales, Early Broccoli, and Hollow-leaf Giant Cauliflower should be made at once. A small sowing of Savoy may also be made. Endive for summer use may be sown now in drills 15 inches apart, thinned, and afterwards transplanted as soon as the seedlings are fit to handle.

RADISHES AND MUSTARD AND CRESS.—Make a sowing of Radishes in a slightly heated pit and keep the pit quite close until the seeds have germinated. Water the plants freely with clear, soft water, in order that they may grow quickly. Mustard and Cress should be sown each week in a warm pit.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatten Park, Reigate.

AERIDES AND ITS ALLIES.—Such Orchids as *Aerides*, *Saccolabium* and *Angraecum* are showing signs of root activity. The plants should be cleared of all traces of scale insects. Specimens that have lost a number of their bottom leaves, so that a part of their stem has become bare, should be treated as follows: If a few aerial roots can be retained, the stem may be shortened and the plants potted afresh, with the leaves on a level with the top of the pot. Plants that are well furnished with leaves need not be disturbed by repotting, but should have the old material removed from their roots, replacing it with fresh compost. *Aerides*, including *A. odoratum*, *A. Lo Lobbii*, *A. Fieldingii*, *A. Sanderae* and *Angraecum sesquipedale*, are best grown in pots on the stage, whilst such *Saccolabiums* as *S. violaceum*

and *S. retusum*, together with *Angraecum fastuosum*, *A. holooides*, *A. citratum*, and *A. Kotschyi*, grow best in shallow pans or Teak-wood baskets suspended from the roof-rattens. In repotting these plants, place a quantity of crocks in the bottom of the receptacles as drainage material. Employ clean Sphagnum-moss as a rooting medium, mixing portions of broken pots among it to allow the water to pass through freely. Fill the receptacles to their rims, the material to be highest in the middle, and finish with a layer of living Sphagnum on the surface. Water the roots copiously, place the plants in the warmest house, and keep the moss moist by frequent sprayings until growth is again active. At that stage water may be supplied freely. Such species of *Ardisia* as *A. Lindleyanum*, *A. crassifolium*, *A. crispum* and *A. Warneri* are best grown in an airy position in the Intermediate House.

CATASETUM, CYCNOCHES, AND MORMODES.—As soon as young growths develop from the base of the pseudo-bulbs of *Catasetum*, *Cycnoches* or *Mormodes*, the plants should receive attention for repotting. Shake the old compost from the roots, cut away all decayed portions and pot the plant each season in a receptacle of moderate size only, for over-potting is injurious to these plants. Put plenty of drainage material in the pots, and press the compost firmly round the base of the rhizomes. Long, heavy pseudo-bulbs should be neatly tied to stakes. A suitable compost for these plants consists of a mixture of *Osmunda* fibre cut into rather short portions, chopped Sphagnum moss, and sufficient crushed crocks to keep the soil porous. The plants should be grown near the roof glass in the warmest house. Give them similar treatment in watering to that recommended for deciduous *Calanthes*.

FRUITS UNDER GLASS.

By JAS. HIBSON, Gardener to IROBORN RE KORTSCHMID, Esq., C.A.O., Gunnersbury House, Acton, W.

TREES IN FLOWER.—With the increased length of days and occasional sunshine there should be no difficulty in getting the flowers to set well. The bees are busy amongst the trees, and they do not attempt to escape from the house even when the ventilators are opened to render the atmosphere more buoyant. In damp, dull weather use a little extra warmth in the pipes to assist in keeping the pollen dry. When reducing the amount of ventilation in the afternoons we give a general damping of the bare surfaces.

PINES.—Plants of Queen Pines that are showing their fruits should be watered a little more freely than hitherto. I have grown this variety both in pots and planted out, but I prefer pots, as the watering is more readily under control. Use warm water for Pines at all times, but more particularly at this stage of fruiting. Do not permit an undue number of suckers to develop, but leave only sufficient to keep in the required stock. Younger plants that are intended for fruiting next year should soon be potted into their fruiting pots. The temperatures of the Pine pits should be 65° min by night, and 80° to 90° by day with sun heat.

PLANTING VINES.—The first fortnight of April is a good time for planting vines. If the soil has been duly prepared, as advised during March, and protected from both rain and snow, it should now be in a good condition for making up. During a dry spell it should have been uncovered, and, if possible, turned over. In making our present Vine borders, I formed a concrete base of ground-lime and gravel. On this I laid four-inch agricultural land pipes close together up and down the border, and on that the rough rubble drainage; it was finished off with mortar rubble. On this the roughest pieces of the turves were laid out, and the border was built up as solidly as possible until the height for planting was reached. The soil was made slightly to slope outwards. The depth of the border was about 5 feet 6 inches, and the width for planting was under 4 feet. This is ample both in depth and in width for at least two years. It is better to get the border near the house well permeated with roots at the start. The Vines should be distinctly on the move by the time of planting,

but not sufficiently so as to cause any check to the growths. It is well to disbud up to the roof. If three young shoots are left it will be ample, one being ultimately chosen to form the rod. The roots should be completely shaken out, and if they are much intruded it will be well to wash the soil completely off them. See that some of the roots radiate away both to the right and to the left, as well as in other directions. If any roots appear to be at all damaged, they had better be cut off above the injury, otherwise it is better to lay them all out. Cover lightly with soil as each Vine is being attended to. Then, when all are planted, place more soil to the depth of between three and four inches over the roots. Press this down firmly with the hands, and afterwards give a fair soaking of lukewarm water to settle the soil. A light shaking of litter from the stables will make a good covering if the borders are outside, but inside it is immaterial. Permanent Vines should be planted four feet apart. The after-treatment for a few weeks as regards temperature should be moderate. Do not attempt to excite growth too soon, but rather wait for signs of root action. As a night temperature, 55° should suffice for the first few weeks. Take advantage of the sun heat, however, in sunny weather by being the house early in the afternoon. Do not on any account overcover the newly-planted Vines with plants in pots.

THE FLOWER GARDEN.

By W. J. CUTLER, Gardener to Mrs. DUMPERTER Keble Hill, Staffordshire.

ANNUALS FOR SUPPLYING CUT BLOOMS.

Annals suitable for supplying flowers for cutting are: *Stibidius*, *Conopsis*, *Gallardia*, *Conia leucantha*, *Phlox Drummondii*, *Clarkia*, *Larkspur*, *Sunflowers*, *Hibbysium*, *Alonsoa*, *Mirabilis*, *Nemesia*, *Statice*, *Dianthus*, *Aster* and *Stock*. The seed of the majority needs to be sown very freely in boxes, raised with a minimum of heat, and the seedlings transplanted in cold frames 4 inches apart. The frames should be sprayed and shaded daily, and kept close for a week or ten days, when air may be admitted in gradually increasing quantities. Certain kinds, including *Nigella*, *Poppy*, *Lupin*, *Eschscholzia*, *Gypsophila elegans* and *Mignonette* are best sown when they are intended to flower. Most of the plants will need a space of 12 inches or more.

CALCEOLARIA.—If the plants of bedding *Calceolarias* are allowed to remain in the frames for too long they become drawn and crowded. We lift our plants of *Calceolaria*, *Pentstemon* and *Marguerite* with good balls of soil and transplant them temporarily in beds on a warm border. Protection is afforded for a few weeks by placing some lights over the plants.

PANSIES AND VIOLAS.—Young plants of *Pansies* and *Violas* in frames are in an excellent condition for removal to their permanent quarters out of doors. Continue to pick off all flowers for a present.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHWICH, Eastwell Park, Kent.

CALADIUM. If the old corns of *Caladium* have not been shaken free from soil, potted afresh, and placed in a hot, moist house for an early start, this work should be done now. The plants may either be potted direct into small pots, or, what is perhaps a better plan, and a saving of labour, placed thickly in boxes on a layer of leaf-mould, to be transferred later to pots of a large size. Be careful not to damage the brittle roots, and use a light, open compost consisting of equal parts fibrous loam, peat and flaky leaf-mould, to which crushed charcoal and sharp sand are added. *Caladium* require plenty of heat and light when in active growth, and may be grown in a Cucumber or Melon pit. Take care that the corns do not receive an excess of water before they have produced leaves.

CYPERUS ALTERNIFOLIUS.—All the *Cyperus alternifolius* succeed in spite of ordinary conditions, and are graceful and ornamental plants for the amateur's greenhouse. *C. alternifolius* can be propagated with ease, so that young stock can

be grown each season. A pinch of seed will provide a good batch; or, failing this, a simple method is to take some healthy leaves, cut off the stalk an inch from the head, and the ends of the leaves to within 2 inches of the centre. Place them in a pan of sand and water, and place near the hot-water pipes. After a short time both roots and new growths will be emitted, and the little plantlets can be potted up. Young plants quickly grow into decorative specimens, and are much to be preferred to old divided plants. Two other species equally valuable are *C. natalense* and *C. laxus*.

OPHISMENUS BURMANNI VARIEGATA.—This pretty grass, better known in gardens as *Panicum variegatum*, should be propagated at this season. After the cuttings have been taken off the old plants the latter may be discarded. It is best to strike the cuttings direct in the pots they will occupy throughout the season. Do not fill the receptacle more than three-parts with the soil in order to allow plenty of room for top-dressings. The cuttings root freely in a warm propagating frame or shaded corner of a hot house. The plant thrives best in partial shade; it is liable to be dried up in the full glare of the sun and lose its freshness.

GARDENIA. Well-established *Gardenias* in pots with plenty of active roots require copious supplies of water, and stimulants at regular intervals at this season, for drought might cause a check to growth, resulting in the flower-buds dropping. *Gardenias* planted out in warm pits or low houses thrive exceedingly, but are usually somewhat later coming into bloom than pot specimens, to which they make an excellent succession, and the quality of the bloom is of the best when the cultivation is good. Examine the plants regularly for mealy bug, which is a great pest of *Gardenias*, and spray or sponge them with an insecticide before they come into bloom, paraffin emulsion being a suitable specific.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. F. DRYER, Abbotts Wood, Godalming, Surrey.

GOOSEBERRIES.—Bushes and cordons should be sprayed as the leaves are appearing, using a strong solution of quassia extract. This may with advantage be done several times. If mildew is feared, apply a dressing of sulphide of potassium at the rate of 4 oz. to 10 gallons of water. This should be used before the fruit appears. Another sprinkling of lime will be beneficial to the trees and ground.

APRICOTS AND PEACHES. These in flower should have the blinds or protecting material placed over them each night, but taken off in the daytime.

THE FRUIT BORDERS.—The work of pruning and training should be finished by now, as the blossoms will soon expand. Make a careful examination of all trees to see that nothing has been overlooked. Rake and make the fruit borders tidy, burning the rubbish. An inch or so of cold ashes mixed with a little lime will give the border a tidy appearance, is good for the trees, pleasant to walk on, and easy to keep free from weeds, besides acting as a deterrent to slugs and insects.

PROTECTION OF FRUIT BLOSSOM.—Whenever practicable, it is a good plan to give slight protection to trees in bloom, especially in a season like the present. Early Cherries, for instance, should be protected at night. A piece of straw should be hung over the trees, or, failing this, some long strips of bracken or Heather can be tucked in between the branches and removed in the morning.

ARREARS.—Take advantage of the better weather and longer evenings to do any work that has been left undone through stress of weather or lack of labour. See that the Strawberry plots are clean and free from weeds. Hand weeding is tedious, but it is best at this season, as weeds do not grow again if conveyed to the fire and burnt. See that the newly-planted Raspberries have been cut back, as it is a great mistake to allow them to fruit the first year.

EDITORIAL NOTICE.

Editors and Publisher.—Our correspondents would oblige by delaying in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHERS; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication. as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

SUNDAY, APRIL 8.

Summer Time commences. Clock to be put forward one hour at 2 a.m.

MONDAY, APRIL 9.

R.G.A. Conference at Birmingham.

WEDNESDAY, APRIL 11.

Rev. Hort. Soc's Com. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 46.0.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Wednesday, April 4 (10 a.m.) Bar, 29.5; temp, 41.5°. Weather—Cloudy.

SALES FOR THE ENSUING WEEK.

WEDNESDAY.—

Sale of Fruit Trees, Rose, Herbaceous Plants, Lilies, Gladioli, &c., at 67 and 68, Chesham, F.R.C., by Protheroe and Morris, at 12 o'clock.

We congratulate the Gardeners and Horticultural Section of the National Service, the Department of Food

Production on its successful efforts to help the gardener out of the difficulties which have lately threatened him.

During the past few weeks letters have reached us from readers who have felt uncertain as to their exact position in regard to the appeals made by the Director-General of National Service. Most of our correspondents have asked in effect whether they, as head gardeners in charge of establishments where vegetable production forms a considerable proportion of the work done, and the care of valuable stocks enters largely into the management, might consider themselves as already doing work of national importance; or whether they should give up their appointments and offer themselves for fresh service. Points of difficulty have also arisen in connection with the regulations issued for restricted occupations, especially in respect to the filling of vacant places in mixed gardening establishments. These doubts are now cleared up, for the Director-General of National Service has issued an explanatory memorandum on the subject. It runs as follows:—

The Director-General of National Ser-

vice, recognising the great importance of food production by small cultivators, has agreed to the following recommendations, made by the Department of Food Production, on the subject of gardeners and national service: A gardener exempt from military service, who is cultivating not less than 1 acre of ground devoted exclusively to vegetables, will be recognised as doing work of national importance, and instructions will be issued by the authorities that gardeners who fulfil this condition should be left to continue their work. The acre may be wholly in a private garden, or part in a private garden and part in another private garden or allotment. Similar considerations will be extended to a gardener who, though cultivating less than 1 acre of vegetable garden, places his spare time services for the purpose of advice and instruction at the disposal of the local food production society or other organisation formed for the purpose of increasing the vegetable food supply. Vacant situations which admit of the carrying out of these conditions may be filled by men who have enrolled as National Service Volunteers, and may be retained until such time as the men are required for national service. Except in the case of luxury fruits and crops, provision will be made for the similar retention of the minimum number of skilled men necessary to maintain cultivation in fruit gardens, fruit plantations, market gardens, and fruit and forest tree nurseries, and also glasshouses put to the use of essential food production. On the other hand, luxury gardening, hedging-out, lawn-tending, path-sweeping, path-rolling, etc., will enjoy no consideration whatever; on the contrary, in the event of places where gardeners are engaged in such work becoming vacant, they will not be allowed to be filled by men within the specified ages. It is not intended, however, to discourage more than circumstances necessitate the upkeep of collections of plants of great rarity or value the possession of which in this country is a great asset to the horticultural industry.

Nitrogen-Fixing Bacteria in Non-Leguminous Plants.

The existence of nitrogen-fixing bacteria in the root nodules of leguminous plants is now a fact of common-place knowledge, and the part which the bacteria play in forming nitrogen compounds from the free nitrogen of the air is recognised, although the details of the process are not thoroughly understood.

The German botanist, Frank, maintained when the discovery of the nodule organisms and their rôle was made, that nitrogen fixation is a power widely spread among plants. His contention has been in part verified, and it is known that the power of fixing and combining nitrogen is by no means confined to members of the natural order Leguminosae. Among the latest of the discoveries bearing on this important subject are those concerning the occurrence of nitrogen-fixing bacteria in the leaves of various members of the

Rubiaceae. The discovery was made by Zimmermann and Faber,* who have described the occurrence of colonies of nitrogen-fixing bacteria in the leaves of *Pavetta Zimmermanniana* a small Rubiaceous tropical tree or shrub with opposite, nearly elliptic, leaves. The leaves of this species, and also of several other species of the genus and of the genus *Psychotria*, contain colonies of a nitrogen-fixing bacterium (*Mycobacterium rubiacearum*). The bacterium is found in the micropyle of the seed, and when the latter germinates, colonies of the bacterium grow through the stomata of the young leaves into the intercellular spaces, where they become enclosed by the growth of the epidermal cells, and as a result bacterial knots—so many as several dozen in a leaf—are formed.

If the bacteria are present the seedlings grow and flourish in soil containing no nitrogen, but if the bacteria are destroyed by treating the seeds with hot water and corrosive sublimate, the lack of combined nitrogen in the soil, and the inability of the plant in the absence of the bacteria to fix atmospheric nitrogen, result in the yellowing and dying of the seedlings in a few weeks.

It is noteworthy that Indian agriculturists have long recognised the manurial value of the leaves of various Rubiaceous plants.

PLANTAE WILSONIANAE.—Since the completion of FORBES and HEMSLEY'S *Enumeration of Chinese Plants* (1896-1905), there has been an almost continuous flow of literature on the Flora of North-Eastern Asia—that is, of China, Japan, and Formosa—the last mainly by Dr. HAYATA and other Japanese botanists. The appearance of a third part of the third volume of the *Plantae Wilsonianae* brings to a finish the record of some of the results of the fruitful journeys of the most successful of all botanical travellers in Central and Western China, not forgetting DAVID, HENRY, FORBES, and others. The measure of E. H. WILSON'S success is known throughout the whole botanical and horticultural world, and this part of the *Plantae Wilsonianae* summarises the woody element of his vast collections of dried specimens, seeds, and plants, which are supplemented by 850 excellent photographs of the vegetation, and of fine examples of individual trees and shrubs. The parts of this useful work have been more or less fully noticed in the *Gardeners' Chronicle* as they appeared; the first in the issue of February 3, 1912. Professor C. S. SARGENT, the Editor, contributes a Note to this final part, from which we learn that the entire work comprises 2,716 species of woody plants belonging to 429 genera and 100 families. Of these, four genera and 382 species were previously undescribed. These totals do not include species previously described in other publications. WILSON'S four journeys in China have added to the ligneous flora 521 species and 356 varieties and forms in novelties, embracing numerous valuable ornamental and useful kinds of hardy plants. There are about 100 pages of numerical lists of names, including numbered specimens of all other collections examined in connection with the elaboration of WILSON'S four collections. These will be exceedingly useful to individuals and institutions possessing unnamed sets of any of the plants in question.

**Jahrbuch f. Wissensch. Bot.*, 51, p. 285, 1912, and 54 p. 243, 1914; see also *Plant Immigrants*, Nos. 121-129, 1916.

ESCHSCHOLZIA CAMBRIDGE CREAM.—

This is a new and beautiful colour form of *E. californica* which not long since originated in the Cambridge Botanic Garden. It was noticed by Mr. F. G. PRESTON, foreman of the outdoor department. It is an annual in practice as to sowing, and also as to its existence in most gardens, but Messrs. SUTTON AND SONS remark in their catalogue that *Eschscholzia* are really perennials. It is better, perhaps, to have them as annuals, for it is difficult to imagine that as perennials they would be so fresh and perfect as they are, and, moreover, they have a length of season that nothing can surpass. They are all beautiful, and among flowers of the border in bud there is nothing more clamring than the variety *Rose Cardinal*. There are pinks and orange, yellow and rose, and this addition is pale cream. Twigs of the foliage of *Eschscholzia* are most useful for floral decorations. The accompanying illustration is from a photograph by Mr. PRESTON.

ALLOTMENTS IN BRUSSELS.—Much attention has been given lately to the work of the Commission for Relief in Belgium. An idea of what is required to keep the population alive may be drawn from the fact that, in spite of the intensive cultivation all over the country, only one-fifth of the required breadstuffs can be grown in normal times. In Brussels 80,000 food rations for adults were distributed on January 1, 1915; on January 1, 1916, this figure had grown to 375,000 a day, or nearly one for every two inhabitants of the town. Every bit of land is under cultivation. An organisation existing before the war, "The Corner of Land," has done much in this respect. With the help of the local Comm. a subsidy of 1 franc an acre (94. per 100 square yards) is paid to those who break up waste plots, and technical advice is given all over the town, where, last year, not less than 500 acres, formerly uncultivated, were producing vegetables.

THE GENUS EUCALYPTUS.—The twenty eighth part of Mr. J. H. MATTHEW'S *Critical Revision of the genus Eucalyptus*, deals with a small group of peculiar species, or forms, namely:—*E. verrucosa*, *E. Muelleri*, *E. Kitchiana*, and *E. viminalis*. *E. verrucosa* is usually a shrub, 4-6 feet high, though occasionally it assumes the form of a tree, 12-20 feet. It is restricted to the mountains of Tasmania, at elevations of 2,000-4,000 feet, and has apparently never been introduced into this country. This is, perhaps, the smallest species of the genus, and it is one of the few species known to produce flowers in the opposite-leaved stage. *E. Muelleri* is also confined to the mountains of Tasmania, where it attains large dimensions, often reaching a height of 200 feet. Nicholson's *Dictionary* records it as having been in cultivation in this country. *E. Kitchiana* is a little known species, apparently local in Victoria. *E. viminalis* is an elegant species, of wide range in Eastern Australia, from Tasmania, South Australia, and Victoria, northward to Southern Queensland, presenting considerable variation in different localities, especially in the size and shape of the leaves. The synonymy, too, is intricate. Some particulars of this species may be found in the *Gardener's Chronicle* for November 24, 1888. According to MATTHEW, the foliage has a dainty fragrance not easily described. The figures leaves of the adult stage 9 or 10 inches long, and half an inch wide in the widest part, and he describes leaves of the juvenile stage as a foot long.

INCREASED PRICE OF SEED POTATOS.—Under a new Order issued by the Food Controller yesterday the Seed Potatoes (Prices) Order (No. 2), 1917, the existing provisions relating to seed Potatoes have been extended until the end of April. The prices chargeable for seed Potatoes are also raised by £2 per ton all round, and seed Potatoes are now defined as meaning any Potatoes which will not pass through a riddle

having a 1-inch mesh, and will pass through a riddle having a 2-inch mesh. The Order further continues until the end of April, the existing Orders being also applicable to seed Potatoes in Ireland.

THE WEATHER.—The response of the people of this country to the appeals made to them to assist in the production of increased quantities of food has been satisfactory, and thousands of men, women, and children are now spending their leisure moments digging, preparing, and planting the plots of ground assigned to them. The weather, however, instead of being helpful, has, on the contrary, hindered in every way the progress of work on the land. Spring is scarcely yet in sight, the Almond has yet to blossom, and March has been, on the whole, colder than many a December or January of late years. With the beginning of April, it was hoped that an improvement would take place, but such hopes were doomed to disappointment, for during the first

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PROBLEMS OF FRUIT-PLANTING.—My attention has been directed to some remarks on this subject by *Southern Grower* in your issue of March 10. These remarks are so fully in accordance with our own convictions on the subject that I am tempted to point out two minor details wherein our opinions differ. The writer concludes that ramming the soil on planting may be beneficial in very light soils, but is not advisable in heavy ones. The evidence, so far as it is known to me, is, however, in the opposite direction. The great majority of our experiments were made in heavy soils—indeed, the Wolfram Farm itself is on the Oxford clay—and it was in such soils that the best results were obtained. In a case where the soil was very light the results of ramming were nil, as, I think, might naturally have been expected, for ramming sand is likely to be as futile as the

FIG. 50.—ESCHSCHOLZIA CAMBRIDGE CREAM.

three days of the month the ground was white with snow, and a keen north east wind prevailed. The thermometer sank each night below freezing point, and especially in the North very low thermometer readings were recorded, notably 29° from Berwick, which constitutes a record for the present month.

LOCAL SOCIETIES.—At a meeting at Liddington, Bedfordshire, held on the 30th ult., under the presidency of Mr. FRANK HUMPHREYS, chairman of the Parish Council, it was resolved to establish a society, to be known as the Liddington Food Production Society, whose energies will be directed toward the encouragement of increased and improved crops in the cottage gardens, allotments, small holdings, and farms of the parish. Mr. HERVEY J. WRIGHT, by whom the meeting was called, was appointed honorary secretary. Mr. WRIGHT will be glad to hear from secretaries of similar organisations. His address is White Lodge, Liddington, Aunthill.

proverbial ploughing of sand. The other point on which we must differ from *Southern Grower* is that planting with ramming entails greater expense. Of course, if we plant in the usual way, and then ram, that means so much additional labour; but when the planting is carried out according to our method of just covering the roots with soil *anyhow*, and then ramming, the operation is certainly quicker and more economical than ordinary planting. One great advantage presented by the ramming method is, in our opinion, that it can be carried out whatever may be the condition of the soil at the time, short of its being frozen. Our immediate object in planting is to secure contact between the roots and the soil; this in the ordinary way is effected by shaking the soil in between the roots, and pressing down; but if the soil is lumpy and sticky, the contact thus obtained is very imperfect, and the results are disastrous. On the other hand, a good ramming infallibly ensures contact, and the more easily so the worse the condition of the soil at the time. We have planted many hundreds of

trees in soil which was in a state which would have rendered ordinary planting out of the question, and so, far as I can remember, without a single failure. It is well, however, to draw attention to one instance quoted in our last report on the subject, where ramming proved disastrous. This was in a clay soil the London clay which contained much sulphur, and the temporary absence of aeration induced by the ramming resulted in the formation of sulphuretted hydrogen, which killed the trees. Luckily, fruit growers are not likely to have many dealings with such soil. *Southern Grower* mentions two rows of trees which he rammed in his plantations, without producing any recognisable effect. Of course, this absence of effect may well have been a reality, and we obtained such negative results in some of our own experiments. But if the absence of results was assumed merely from an inspection of the trees, the conclusion must be of very doubtful value. Personal observation and impression is an altogether fallacious guide in such matters, and if results are to be of any value, they must be based on definite measurements of some sort. Doubtless, a busy grower has no time for such measurements, but if any grower takes sufficient interest in the matter to carry out planting trials of this sort, we might in some cases arrange to take the measurements for him, and thus place his results on a firm basis. *Southern Grower's* remarks on the subject of the effects of grass on trees appear to us to be very much to the point. It is a subject on which we have still much interesting work waiting publication, as soon as the national strain on our supplies of paper shall have become less exhausting. But it is only a special instance of a general problem—the effect of one growing plant on another. *Spencer Pickering.*

SELECT VARIETIES OF ROSES (see p. 121).—The slaughter of the innocents, so far as Gold Medal Roses of recent years are concerned, is surely proof—if proof were needed—of the unsatisfactory method adopted by the National Rose Society of judging the merits of new varieties. Such relatively new varieties as Iona Herdman, Queen Mary, Countess Clavilliam, Mrs. Forde, Edward Bohane, Mrs. James Lynas, Muriel Dickson, Majestic, Annie Crawford, Mrs. Andrew Carnegie, Lady Mary Ward, and Queen of the Belgians, all of which have been awarded Gold Medals, have disappeared from the "Select List." I agree that Rose lists require curtailing; most of them are far too long. Some of the older varieties, however, will hold their places in commerce for long against many of the newcomers. I have always strongly deprecated the use of the word "Pernetiana." Apart altogether from technical correctness, the word is unfair. Persian Yellow has long been used as a parent by certain British raisers. Many fine Roses that are certainly not "Pernetianas" are descended from the Persian Rose. May I suggest that the title of the section should from henceforth be "Persian Roses"? The attempt at classification in the new *Handbook* is lamentable, and is only making the confusion that at present exists worse than ever. Your reviewer draws attention to this fact. I turn, for example, to the heading "Hybrid Wichuraiana," and find only one name. It is Paul's Scarlet Climber. Then under the heading "Wichuraiana Ramblers" are the names of several Roses that I always imagined were "Hybrid Wichuraiana," what is it? Pemberton's White Rambler is described as the finest White Rambler. What about Sanders' White Rambler? It is the finest, purest, sweetest, and most mildew-proof White Rambler in commerce, and is superior to White Dorothy in every respect, yet it is omitted from the "Select List," whilst White Dorothy is included. Petit Louis and Châillon Rambler, both of which are finer in every respect than Dorothy Perkins, are also omitted. *George M. Taylor, Midlothian.*

STRAWBERRIES: SUBSTITUTE FOR LITTER (see p. 150).—If the soil is moderately heavy, as a good Strawberry soil should be, or the season is not exceptionally dry, it will be better to do without the litter. In place of it procure galvanised sheep netting, which is three feet wide,

with a four inch mesh, and this will cover two rows. Lay the netting over the rows before growth commences. Place upright sticks in the ground at intervals on each side, and bamboo canes across the rows, fastened to these sticks and under the netting. The netting should be close to the crowns of the plants at first, and gradually raised as growth proceeds by pulling the sticks up a little, continuing this till the netting nearly reaches the tops of the stems, when the flowers are expanding. The fruit will be earlier, owing to the ground being warmed by the sun, it will be coloured all round, free from dirt and slugs, sweeter and more luscious, owing to thorough development and perfect ripening, and will not be harmed by millipedes or slugs. Should one of the latter crawl up a stem and come in contact with the fresh zinc coating of the wire, it will make a hasty descent. Also, the fruit will not be trampled on by a careless gatherer. When this plan is intended to be followed, every second space between the rows should be three feet instead of two. The number of plants per perch will be lessened, but the weight of fruit will be greater, because there will be no waste. *Wm. Taylor.*

ONLY TO ORDER.

In consequence of the decision of the Board of Trade, which will come into force on May 1st, to prohibit the return to publishers of unsold copies of any journal, the GARDENERS' CHRONICLE will be obtainable after that date only if ordered beforehand. We ask, therefore, all readers who desire a copy each week (and are not already receiving it direct from this office) to give their local newsagent a definite order to this effect.

ORDER FOR NEWSAGENTS.

To Mr.....Newsagent.
 Address.....
 Please deliver the GARDENERS' CHRONICLE to me each week at the address given below.
 Name.....
 Address.....

PARROTIA PERSICA (see pp. 137, 138).—The various plants of *Parrotia persica* at Aldenham have flowered very regularly for many years past, and I have often used the branches for cases with good effect. In respect of its claret colour, it is superior to its less well-known but also attractive relative *P. Jacquemontiana*, which bears yellowish-green flowers, and of which the finest specimen with which I am acquainted is at Lord Ducie's, at Tortworth. *Victory Gibbs.*

EXPERIMENTS WITH HUMOGEN (see pp. 113, 137).—In reply to Mr. Diver's remarks, the 0.602 ammon. sulphate per lineal yard was applied as an equivalent in nitrogen content to that of the Humogen (if memory serves me it was rather in excess of that amount); it was applied when the shoots were up, but before earthing. In regard to Mr. Chittenden's remarks, seriatim, I used the term "mellow" to express not only that the lime had been well incorporated with the soil mechanically and by the lapse of time, but also that it had been there an adequate period for the establishment of a bacterial balance under the new conditions; by "raw" lime, that these conditions had not been established. My reference to a particular portion of Mr. Chittenden's work (as given) was selected from the direct contrasting of limed and unlimed patches; if from careless reading and noting before leaving home I have given a false impression of that record,

I freely express regret; not being able to refer to the paper here, my impression is that I read in vain to get any definite information as to when the lime was applied and as to the resulting carbonate (or any other) analysis of the soil. The note in this Journal (my second reference) contains no information concerning lime or carbonate, as it lies before me. (The reference that "the material is not standardised" in that reference, and also in his letter (*Gard. Chron.*, March 31, 1917, p. 137), raises the question as to what is the criterion for standardisation? Until knowledge is forthcoming as to the nature of the effective agent, the existence of which many trials seem to indicate, it seems hopeless to call for a standardised article. Cannot Mr. Chittenden tell us what is the elusive constituent? In the trials, in which the substance was placed individually to the plants, actual rows are contrasted, those taken as controls being placed proximally to the trial rows. The variety that was used is named in my article. To what agency are we to refer the occasional benefit of Humogen; the evidence of my trials last year seemed to point to CaCO₃ as a factor; the "old" Humogen had given largely increased yield the year before. Had its goodness wasted in storage in a dry condition? *H. E. Durham.*

ALTERNATIVE VEGETABLES.—I have addressed to Sir Arthur Lee, Director-General of Food Production, the following letter:—"Potatoes are scarce, and will very probably be altogether lacking until the new crop is gathered. It seems to me that it would be a sensible plan to try to substitute for them some new vegetables, of which there are many, and to enrich the culinary art by new products. For instance, the leaves of certain trees, well cooked, might form substitutes for Cabbage and Spinach. The young leaves of the Chestnut, of the Plane, and of many other trees, previously decorticated, might form in time of war, and also in time of peace, acceptable vegetables. I have always heard that in the Jardin des Plantes in Paris, there were composed in 1871 excellent salads of Begonia leaves. Are not salads of the highest quality made of *Chrysanthemum* flowers? The young leaves of Rindbarb, which are thrown away when the stems are used; those of Clover, and even those of tender Ferns, could probably be used in this way or as purees—and how many others? Of course, one would have to begin by testing these new vegetables (?) and only use those which were found to be wholesome and palatable after being well prepared." *Lucien Linden.*

SULPHATE OF AMMONIA FOR POTATOS (see pp. 115, 135). From a practical standpoint Dr. H. E. Durham, in his trials, did not use sulphate of ammonia to the best advantage. My experience on various soils prove that for full benefit it is useless to sow sulphate of ammonia for Potatos when the tops are through the soil. The experiment made by Mr. Divers, although best in his particular case, may not be taken as a general rule for applying sulphate of ammonia. The texture of soil will influence moisture and temperature, and these latter play a most important part with lime usually found in garden soil in rendering sulphate of ammonia available for plant roots. Therefore the texture of the soil should be a ruling factor for the proper application of sulphate of ammonia for a Potato crop. Here the soil is very gravelly, and I find the best results are obtained by broadcasting about 1 lb. of sulphate of ammonia per rod as soon as the soil is sufficiently dry for walking on after planting. This is worked into the soil by the rain and hoeing, and becomes available as plant food to the spreading roots when a stimulant is most desirable to the growing plant. Last season, although Potatos were generally considered a bad crop, from disease; here disease was almost absent. I do not say that sulphate of ammonia will stop disease, nor contend that Mr. Divers was wrong in his experiment, but I do maintain that the method of applying sulphate of ammonia in one district may not be good for a neighbouring district owing to different soil texture. Like Mr. Divers, I have noticed an extra vigour in seed Potatos on land that has been treated by sulphate of ammonia. *G. H. H. W.*

SOCIETIES.

**ROYAL HORTICULTURAL
Scientific Committee.**

MARCH 27.—*Present:* Mr. E. A. Bowles, M.A. (in the chair), Sir Everard in Thurn, Dr. Voelcker, W. Hales, J. Fraser, W. C. Woisdell, and F. J. Chittenden (hon. sec.).

Two-flowered Snowdrop.—Mr. Bowles showed, on behalf of Mr. Elwes, a two-flowered plant of a seedling of *Galanthus Elwesii*. It had the usual two foliage leaves from the soil, but the flowering stem bore a third leaf, about three inches above the soil level, with a slight swelling at the base, and having in its axil a second flower. The axis of the bulb had apparently elongated and carried the flowering stem up above ground.

Alnus glutinosa.—Mr. J. Fraser showed a series of seedlings of the common Alder (*Alnus glutinosa*), which he had found growing near the Thames and in other places. He drew attention to the nodules on their roots, which, he pointed out, were inhabited by organisms, according to Hillier, which enabled the Alder to obtain nitrogen from the air much in the same way as does *Pseudomonas radicecola* in the case of *Leguminosae* plants.

Crocus.—Mr. Bowles showed a series of *Crocus* flowers, including various forms of *C. chrysanthus* of different shades of sulphur and yellow, forms apparently of *C. biflorus*, some of which were of blue shades and intergrading in chrysanths; *C. Balansae* with mahogany-coloured outer segments; a seedling of *C. minimus*, with much larger flowers than usual, and with more substance; very small forms apparently of *C. venus* collected in Montenegro, and perhaps connected with Maw's curious plant from that district; seedlings of *C. Sieberi* variegated and crosses between that and the type *C. veluchensis* from Greece; a curious form between *C. Tommassianus* and *C. banaticus* and others.

Double-spotted Richardia.—Mr. H. W. Hatchell sent a double-spotted *Richardia africana*, with slight green markings on the second, lower spathe. This development is very common in this and other species of *Richardia*.

Gall-like growths in Prunus Pseudo-cerasus.—Mr. R. I. Lynch sent shoots of this rare tree from Cambridge Botanic Garden, showing groups of adventitious buds on swollen places on the shoots; the tree was otherwise healthy, and it was suggested that the probable cause of the growth was damage by sparrows to the bud at the end of a shoot and the subsequent development of buds present in the axils of the scale leaves.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

MARCH 15. *Committee present:* The Rev. J. Crumpleholme (in the chair), Messrs. R. Ash worth, D. A. Cowan, J. C. Cowan, J. Cypher, A. G. Ellwood, J. Evans, P. Foster, A. R. Handley, A. Hamner, D. MeLeod, W. Shackleton, S. Swift, H. Thorp, and H. Arthur (secretary).

A large Silver Medal was awarded to R. ASHWORTH, Esq., Newchurch (gr. Mr. Davonport), and a Silver Medal to Messrs. CYpher & Sons, Cheltenham, for groups.

AWARDS

FIRST CLASS CERTIFICATES

Odontonia Magdi Sander alba Ashworth var., flowers with white ground beautifully marked with lemon yellow; *Lactia Cattleya Beatrix* var. *Ashworthiae* (C. Schroderus = *L. C. callistoglossa*), a large flower of even colour, with round lip of intense crimson, from R. ASHWORTH, Esq.

Cattleya Cowanne alba var. Princess (C. *Mossiae Wogeneri* × *Intermixta Juliette*), a well-shaped flower with white lip and orange-yellow markings in the throat; *C. End alba* var. *Fairy Queen* (*Mossiae Bevaniana* × *gigas Fina Melaine Begardt*), flower over 7 inches across, with petals 3 inches wide. The lip is broad, throat lemon-yellow with heliotrope-coloured lines at the base, from P. SMITH, Esq.

AWARDS OF MERIT.

Odontonia Red Cross var. *Scarlet Pimpernel*, *O. Kiehlgenis* var. *magifica*, and *Odontoglossum Louisa* var. *splendens* (*Ossulstoni* × *psuttoni*) *Charlesworthii*, from P. SMITH, Esq. *Dendrobium Cybele West Point* var., and *D. Atherton* (*rubens grandiflorum* × *Cybele*), from S. GRATRIX, Esq.

Cypripedium Percius (*Lady Dillon* × *delicoides illustris*), from W. R. LEE, Esq.

AWARDS OF APPRECIATION.

Odontoglossum Bayard (*Empress of India* × *Jasper*), 1st class; and *O. crinum* var. *rotundiflorum*, 2nd class, from R. ASHWORTH, Esq.

O. General Maude, 1st class, from S. GRATRIX, Esq.

BRITISH WHOLESALE FLORISTS.

MARCH 26.—At a meeting of the committee of this Society, held on the 26th ult., the president gave a report of the meeting of railway officials and representatives of trade associations he had attended (as the representative of the B.W.F.F.) at the Clearing House, and stated that the Railway Executive Committee would not give way in regard to the order for prepayment, but the railway companies did not desire to relieve themselves under prepayment of responsibilities liabilities accepted on goods carriage forward. The railway companies were prepared to open approved ledger accounts for consignors at the point of consignment. He also pointed out that market customers could arrange for deposit accounts, against prepayment of carriage, at the place of consignment. The letter originally drafted by the Market Sub-Committee for the use of salesmen, etc., had been submitted to various Market Associations and to the Federation's solicitor, and was generally accepted as suitable. This letter, with the addition of a fly leaf containing a printed acceptance of the new conditions for its signature and return, was accepted by the committee, and the secretary was instructed to send a copy to each member for their use if they so desired.

NURSERY AND SEED TRADE.

MARCH 26. The annual general meeting of the Nursery and Seed Trade Association was held on the 26th ult. Mr. J. B. Shole (Messrs. Protheroe and Morris) was appointed chairman.

The committee's report and balance sheet from July 1, 1915, to December 31, 1916, were submitted. The report showed that the association had made 542 inquiries relative to the solvency and otherwise of traders throughout the United Kingdom, and made 441 special local inquiries. The report also showed that the association and its solicitor had collected during the above-mentioned period £4,528 10s. 10d., principally by small payments through the Courts. The question of a General Commercial Import Tariff was raised in consequence of a letter from one of the members, and the following resolution, proposed by Mr. Low, was passed:—

"That it is advisable to consider the steps to be taken to protect the interests of the nursery and seed traders after the war, and that the other trade associations be approached with a view to some united action being taken."

Mr. J. E. N. Sherwood (Messrs. Hurst and Son) was appointed president, and one of the trustees of the association in the place of his father who had acted as president since January, 1885.

Obituary.

H. VAN DIEVOET.—News has reached London of the death of M. H. Van Dievoet, nurseryman at Meysse, near Brussels. For years M. Van Dievoet, who died at the age of 77, had been burgomaster of his commune and president of the Horticultural Society of Laeken, the Royal residence. M. Van Dievoet was one of the last representatives of the old school of Belgian horticulturists.

CROPS AND STOCK ON THE HOME FARM.

MANGOLDS. The Mangold is one of the most useful of all roots on the farm, and one that is capable of giving the heaviest yield of cattle food. With ordinary cultivation, 30 tons of roots per acre is a reasonable crop, and doubly this amount is obtained by some with suitable soil and locality and high cultivation of superior varieties. For cows from November to May, Mangold is the principal root food. Some may, in the autumn, prefer Turnips or Swedes, but Mangold is not so liable to taint the milk. For sheep, Mangolds are invaluable when the Turnip crop fails. With Rye, Winter Barley, grass and Vetches during April and the succeeding four months, Mangold is excellent food, and when well stored the roots improve, for the sugar which they contain becomes matured. Horses and pigs appreciate the roots from January onward. For poultry, too, in small quantities, either cooked or raw, Mangolds are useful, though too many in a raw state tend to produce diarrhoea in the birds. No time should be lost in finally ploughing the land that was manured and ploughed in the autumn, a fine-till being necessary to ensure a good "plant." Soil light in character and free from weeds need not be again ploughed if cultivated during dry weather; a good till is all that is required in this case. The middle of April is a good time to sow the seed, at the rate of 3 lb. per acre for the Tankard form for the dairy, and a Globe variety for the greater bulk, for sheep.

TREATMENT OF COWS BEFORE CALVING.—Persons of inexperience are liable to have cows down with milk fever within a day or two after calving, which may mean a serious loss. The chief cause of milk fever in cows is their being in too fleshy a condition at the period when they are approaching parturition. Within six weeks of this stage they should be most carefully fed on good hay and straw, with water at all times available in an open yard with shed accommodation, so that the animals can get abundant exercise. When cows are thus treated milk fever is almost unknown, and the cows produce larger and more healthy calves than where they are kept more in the house. The animals must not be allowed to get too low in condition, or the calves will suffer. In the case of a cow in this condition, where only poor quality hay is available for food, 2 lb. of Linseed cake per day may be given with advantage. A moderate sized cow will consume 10 lbs. of hay daily.

SULPHATE OF AMMONIA FOR WHEAT.

Farmers who applied sulphate of ammonia in late autumn to Wheat, are recommended by the Board of Agriculture to give an additional $\frac{1}{2}$ cwt. to $\frac{3}{4}$ cwt. per acre to backward crops on poor land. Where there was no autumn dressing $\frac{1}{4}$ to $1\frac{1}{2}$ cwt. per acre should be given. On poor land the Oat crop should get $\frac{3}{4}$ to 1 cwt. sulphate of ammonia; on land in fair condition $\frac{1}{2}$ cwt. to $\frac{3}{4}$ cwt. will suffice. Orders for sulphate of ammonia should be placed with manure merchants at once. The price for the standard grade has been fixed at £16 per ton delivered at the purchaser's railway station in maker's bags.

WIREWORM

One of the worst pests the farmer has to contend with is wireworm. This pest eats the stem of Oats and Barley immediately above the seed in the spring, and also devours the young growths of Swedes and Turnips directly they show through the soil. Oats are generally sown on a grass plot intended to be broken up, or an old Sandton ley, and the grass and couch roots form a happy hunting ground for wireworms. Clean cultivation and frequent moving of the soil, with liberal manuring, are good preventives. A fillip to the growth of the corn is required directly it shows through the soil, in order to hasten the formation of the second and third leaf, and after that stage of growth wireworm does no harm. Three quarters of a cwt. of nitrate of soda, or 1 cwt. sulphate of ammonia per acre, sown evenly over the part of the field likely to be attacked, is a good preventive. *E. Molyneux, Swanmore Farm, Bishop's Cleeve, Hants.*

REMARKS.—The price is now £12 per ton, as fixed by the Food Controller, yet very few tubers are available. Edward J. Newbourn, Covent Garden and St. Pancras, April 5, 1917.

GARDENING APPOINTMENT.

Mr John R. CART, recently for 6 years Gardener to E. J. CHATWIN, Bromsgrove, Worcestershire, as Horticultural Instructor and Demonstrator for the county of Glamorganshire.

ANSWERS TO CORRESPONDENTS.

CHICORY: J. M. Successful experiments in the cultivation of Chicory for its roots as a mixture with Coffee were carried out in 1914 by the Aberdeen and North of Scotland College of Agriculture. The variety tested was Magdeburg. The experiments showed that the best soil for the crop is a deep loam, and sub-soiling previous to the seed being sown was proved to be a great advantage. No farmyard manure should be used immediately before planting, but dressings of artificial manures are beneficial. The crop was planted early in May, and lifted in November. The yield was 19 cwt. per acre, and the returns to the grower about £16 per ton. The ground roots produced excellent Chicory. There is considerable labour and expense entailed in connection with the crop owing to the heavy dressings of manure necessary, and the continuous cultivation to keep the land free from weeds in the early stages.

EMPLOYMENT OF GARDENERS: W. B. You will find that your question as to whether gardeners out of employment can be engaged by private employers is dealt with in the leading article in to-day's issue of this paper, p. 144.

FORCING BY ACETYLENE: M. Y. (See p. 126.) The paragraph you refer to was taken from *The Revue Horticole* for March 16, 1917, p. 250. It is not stated exactly what results followed the application of the acetylene gas, except that they were "comparables a ceux fournis par l'éthérisation." Nor is it stated whence the information is derived, except that it emanates from Switzerland, and is descriptive of experiments made in Austria. The correct temperature of the house is given as 17° to 19°, falling to 14° at night; but as it is not stated whether this measurement is Centigrade or Réaumur, we omitted it as not being sufficiently explicit.

GRUB: S. P. The grub is the larva of the cockchafer, or May bug, *Melolontha vulgaris* (see fig. 51). It is destructive to vegetable roots, and should be destroyed.

NAMES OF FRUITS: Somerset. The Apples were bruised and past; send fruits earlier next season.

PEACH TREE DISEASED: W. B. The tree is affected with Silver-leaf, which is said to be due to the fungus *Stemium purpureum*, but no control of the disease is known. Some authorities consider that the injury is due to an excess of nitrogenous matter in the soil. If

FIG. 51.—ADULT INSECTS AND LARVA OF THE COCKCHAFFER.

the malady is restricted to a single branch, cut out the shoot and burn it.

PLANET JUNIOR HOE: E. D. The Hand Planet Junior hoe is sold by horticultural sundriemmen and most nursery firms, though the stock in this country is said to be very low.

POTATOES WITH MARKINGS: An Old Reader. The brown markings in the flesh of the tubers (which are liable in cooking to turn black at such places) are characteristic of the disease known as "sprain." This is not caused by any organism, but is due to some deterioration of the Potato. Such tubers are quite fit for food (in their sound parts), and are unaffected for seed purposes.

TOMATOES UNHEALTHY: W. W. From your description of the plants we suspect that they are affected with disease. Send a specimen for examination.

VEGETABLE IMPORTS AND PRODUCTION: E. L. The total quantities of Potatoes and other vegetables imported into the United Kingdom in the years you name were, according to statistics furnished us by the Board of Agriculture, as follows:—

Year ending December 31.	
Potatoes, bushels	9,477,314 2,532,744 2,170,717 1,863,174
Onions, bushels	9,196,164 7,243,513 7,477,593 6,848,247
Tomatoes, cwt.	1,582,950 1,576,617 1,394,897 1,619,282
Vegetables, raw, unenumerated, value	519,340 475,714 518,382 233,840

The acreage and production of Potatoes in the United Kingdom in the same years were:—

	Acreage.	Production.
1913	1,173,418	7,604,804
1914	1,197,008	7,476,458
1915	1,202,259	7,540,240
1916	1,144,375	5,468,881

REMARKS.—Owing to the Easter festivities this week-end cut flowers will be more in demand, and prices are likely to advance considerably. The severe weather will probably check supplies. White Liliums and Richardias (Arums) are usually in good demand during this week. It is difficult to give correct quotations of prices, as the arrival of Guernsey and French flowers are now very irregular.

NOTES FROM A GALLOWAY GARDEN. IV.*

WRITING at the end of February in the fatuous belief that we had reached the end of the severest winter since 1855, I expressed myself somewhat arrogantly on the way certain plants on the borderland of hardihood had borne the ordeal. I should have known better than to be deceived by a few mild mornings, which were but the prelude to visitations of intense cold on March 7, 8, and 26, and April 1 and 2. The temperature on the last of these dates was—Shade 25° and Grass 14°, being the lowest April temperatures recorded in Glasgow during fifty years, except on April 24, 1902, when the grass temperature fell to 11½° Fahr. This reiteration of Arctic conditions has wrought far more mischief than all that went before, not because plants had started into precocious growth; on the contrary, they had been kept well back by persistent low temperatures since the New Year. They suffered in March more than they had done in weather of equal severity in the short, dark winter days simply because the days in March are neither short nor dark. A good illustration of the effect of sunshine upon frozen vegetation is presented by a fine specimen of Trientalis lancolata, 10 feet high and 18 feet round the branches. Winter sunshine never reaches it, being screened off by high trees to the south and west, and the plant came scatheless through the severe frosts of February, carrying myriads of pendent flower-buds which will swell into carmine globes in June. But the sun of March rises over the tops of the sheltering trees, and about one-third of the bush has now been seared as if by flame. I comfort myself with the assurance that the bush will have a more picturesque outline after the dead branches have been cut out.

This morning (April 2), as I write, even the common Daffodils have bowed their golden coronets to the sward. Still, I do not think it will be found that many things have been killed outright, although all prospect of blossom on such wall plants as Clianthus puniceus, Sophora tetraptera, and Calceolaria violacea is utterly at an end for this season. Carpentaria and the common Myrtle are severely browned, but will recover; while Abelia floribunda, Berberisidopsis,

Buddleia Colvilei, and Lapageria—all on walls—remain unharmed. The new Chinese honeysuckle, Lonicera tragophylla, has proved as hardy and as precocious in growth as our native species. It is desirable because of its rich yellow flowers, although these are quite scentless; but even on our cloudy West coast it should be grown in a north exposure, for it is terribly subject to the ravages of aphides if it gets too much sun. It is surprising that the Chilian Myrtus Luma is not more often seen in gardens near the sea. It is true that neither the foliage nor the white flower which it bears in such abundance possesses the fragrance of the European Myrtle; but it is a very beautiful evergreen for all that, and may easily be raised from seed.

Another fine shrub which one does not often meet with is Berberis pinnata (Mahonia fascicularis de Candolle); in fact, the only private grounds, except my own, in which I can recollect seeing it are the neighbouring garden at Glasserton and the late Canon Ellacombe's lawn at Bitton.

It may, however, be more commonly grown than I suppose, seeing that in a young state it is very easily mistaken for the common Mahonia—R. Aquifolium; but it is of far more arborescent habit than that well-known shrub, rising to a height of twelve or fourteen feet, with a stem a circumference of 18 inches. This Barberry is usually a very gay object before the end of March, crowded with fragrant yellow blossoms; but this year it is very late, like every thing else. A native of the Southern States of North America, it is not so hardy as the common Mahonia, and should be given a position sheltered from the cutting winds, for the chief beauty of the plant consists in its fine pinnate foliage.

The mention of Mahonia brings to mind a pretty display which took place a few evenings ago in full view of our library window. A bulb in a china shop, a pike in a trout stream, a schoolboy in the still-room—each may serve as a type of destructive energy; but for unmitigated, devastating plunder, commend me to a cock pheasant in the spring flower border. Nor will this most voracious fowl consent to feed in solitude at this season. He must needs bring his chackled wife to share his repast on the blooms of Crocus, Dog's Tooth Violet, and Saxifraga Borrachiana, with crowns of young Clover in the sward. Wherefore, so often as a cock pheasant doth find his way into the flower garden, there ensues a stealthy stalk, a deed of blood, and precipitate flight of the feathered haron. But on the evening aforesaid we watched from the window the proceedings of a pair of marauders, and could not find it in our hearts to interfere with them, so brilliant was the colour display in the level rays of the westerling sun. These thieves were cock golden pheasants (Thaumalea picta); they had attacked a bush of Berberis Aquifolium, and were briskly devouring the yellow buds and blossoms. Golden pheasants, which one used to be told required the shelter of an aviary, are thoroughly naturalised in the woods here, and, though of no value for sport or the game-larder, greatly add by their fantastic plumage to the interest of a woodland walk.

There has been some discussion of late in the gardening Press about different forms of the spring Snowflake—Lewinjon verum. I saw lately in Sir John Stirling Maxwell's grounds at Polk, Kentishweshire, a remarkable and very decorative variety of L. carpathicum, or Vagant. The flower stalks are fasciated, and the blossoms are ranged as a coronet or wreath at the tops of them. One stalk bore as many as eleven blossoms in this fashion, producing a peculiarly rich effect.

Never have I known the Algerian Iris (I unguicularis) to flower so profusely as it has done in this ungenial season. Its position under the wall of a greenhouse (now devoted to the

growth of Tomatos) has enabled it to keep a succession of its delicately-tinted blooms right through the long frost. Iris reticulata flowers freely, and has done with it, but the Algerian Iris goes on for months. Herbert Maxwell, Moorwith.

THE MARKET FRUIT GARDEN.

MARCH this year did not "go out like a lamb." There was frost here, 79, as late as the night of the 27th, and there was a little snow during the night of the 29th. The wind had been in one of the northern quarters almost invariably for over a fortnight up to the 27th, and when it changed to the west on the 29th it was nearly as cold as ever. Still, a considerable portion of the month was favourable to work on the land, the rainfall at my station being only 1.45 inch, while there was a good deal of sunshine in the latter half. There was less rain in my district than was general in the division of England to which it belongs, and we had not one-fourth as much snow as was common further North. The soil, pulverised by the severe frosts, works remarkably well where the horse cultivation of orchards and the hand hoeing of the rows of trees and bushes have begun. Also, in consequence of the frosts, weed seeds have not germinated as they have done after recent mild and wet winters. Never before have my orchards been in so clean a condition at the beginning of the hoeing season as they are this year. This, however, is partly owing to the prolonged employment of a number of women as hoers and as diggers late in the last season. There is reason to hope that the comparative dryness of the last three months has been beneficial to the health of trees, particularly in relation to fungous diseases, which had become rampant after a series of wet and mild winters.

A VERY BACKWARD SEASON.

Among the sixteen past seasons in which I have recorded stages of vegetation in my present place, only two—those of 1901 and 1909—have been nearly as backward as the present season was at the end of March, in relation to the subjects of my observation as a whole. In the following statements the stages of vegetation on March 31 are compared with those of some preceding seasons:—

GOOSEBERRIES.—Leaf buds generally just burst, a stage reached last year on February 29, and occasionally earlier. In most seasons more or less in leaf by the end of March.

RED CURRANTS.—Only a few leaf buds bursting. In 1914 as forward by February 7, and frequently by the first week of March.

BLACK CURRANTS.—Hardly any leaf buds burst. In 1915 the bushes were partially in leaf by March 22, and occasionally they have been so earlier.

EARLY-BLOSSOMING PEARS.—No buds burst, though swollen. Last year as forward by February 23, and clusters of flower-buds were showing on March 18.

EARLY-BLOSSOMING PLUMS.—No buds burst. Last year a little blossom on March 18; in 1915, full blossom on March 31; and in 1912, on March 24.

EARLY-BLOSSOMING APPLES.—No buds burst. Last year clusters of flower buds showed on March 18. In 1915 buds on one variety were bursting on February 23, and a few blossoms were expanded on March 22. Still, Apples are less backward than other kinds of fruit.

RASPBERRIES.—No leaf buds burst. In 1914 one-fourth in leaf by March 31, and in 1915 by February 15.

QUINCES.—No buds burst. Last year one-fourth in leaf on January 31; in 1915, 1914, and 1913, by March 20; and in 1912 the trees were green with foliage on January 30.

* For previous articles see Jan. 13, p. 13; Feb. 17, p. 69 and March 10, p. 106.

ALMONDS.—No buds burst. In some seasons in full blossom by the end of March, and occasionally earlier.

BLACKBERRIES.—No buds burst. Occasionally forward by the end of February, and generally before the end of March.

PRIMROSES.—Very few in flower. Often more in January.

SNOWDROPS.—These flowers were fully out a fortnight ago. They were as forward last year by the end of January.

YELLOW CROCUSES.—In full blossom a fortnight ago. Occasionally they have been so in February.

DAFFODILS (Double Yellow).—None in flower. Often have been so by the middle of March, and occasionally earlier.

WALLFLOWERS.—Killed or partially killed by frost. No blossom. Last year in full bloom on March 22, which was earlier than usual.

ELDER LEAF.—Buds generally burst. Often have been as forward by the beginning of March, and occasionally in February.

LILAC LEAF.—Buds not burst, but on the point of bursting. Often as forward by the middle of March, and in some years before the end of February.

HAWTHORN LEAF.—No buds burst. In 1913 one-fourth in leaf by February 20 in sheltered spots, and often early in March.

FLOWERING CURRANTS.—Occasionally have been forward by the end of February, and usually before the end of March.

FORSYTHIA.—No buds burst. Last year in full blossom by February 12.

DEUTZIA SCABRA.—No buds burst. Last year more advanced by January 31.

TOP-GRAFTING APPLES.

My latest death-sentence on an unprofitable Apple is that which has been passed on Gascoyne's Scarlet Seedling, all trees of which in one orchard and part in another have been cut for top-grafting. Here we have one of the numerous varieties which ought to be put on the black list so far as commercial fruit-growers are concerned, unless, possibly, those whose land is quite light and dry may be excepted. The great trees now reduced to frameworks for grafting had been in the orchard ten years, and they produced only one fair crop four years ago, after which they developed canker on trunks, main branches, laterals, fruit spurs, and fruit buds more or less. The only other varieties ever grown by me which have shown any approach to the virulence of canker attack suffered by Gascoyne's Scarlet were King of the Pippins, Potts's Seedling, and Ribston Pippin, all grubbed up long ago. The cankers on the trunks of the trees about to be top-grafted have long callused over, and plenty of branches can be found for grafts free from canker below the parts cut off. Most of these trees will be re-grafted with Bramley's Seedling, with Newton Wonder on one row of trees, and Charles Ross in the orchard in which only a limited number of the trees has been condemned, the rest, on lightish soil, being comparatively healthy, so that they are to have another season's trial. Bramley's Seedling grafted on Irish Peach two years ago has grown into fine and well-furnished trees. Irish Peach was condemned for scab.

BARK SPLIT BY FROST.

For the first time I find splits caused by frost in the bark of many Apple trunks from a foot to two feet in length, and about half an inch deep. The trees most affected are those which are not over eleven years from the planting, and full of vigorous growth. The proportion of trees with these splits is not large— not over one in twenty in any variety. Cox's Orange Pippin is one of the most commonly affected varieties, as might be expected, seeing that it rarely misses anything bad that is going about. It is desirable to get some Stockholm tar into the cracks to prevent the entry of canker spores. *Southern Grower.*

THE CONSTRUCTION OF A CHEAP SUN-DIAL.

I HAD finished erecting my Rose arches, and had completed the laying of a long flagstone walk, my fishpond and fountain were in full working order, and I had to cast about in search of further "improvements." So I decided to construct a sundial; and the extreme simplicity and low cost of the whole affair has prompted me to describe the work.

First of all the site has to be chosen, and of course the sunniest part of the garden is the best, preferably at the end of a walk.

Dig a square hole, measuring 18 inches each way and about 6 inches deep. Pour into this a well-mixed compost of 1 part cement and 5 parts of grit, sand, or finely broken brick, being careful not to add any organic matter, such as

FIG. 52.—A SIMPLY CONSTRUCTED SUN-DIAL.

manure or garden soil, to the wet mixture. This when set, a matter of a couple of days, will form the foundation. If desired, the bottom stone of the pedestal can be laid on the cement directly if it is poured into the hole. The column is 3 feet 9 inches in height and is constructed of blocks of sandstone, shaped as little as possible, and tapering slightly towards the top. These irregularly shaped stones provide plenty of nooks and crannies in which *Sempervivum* and similar plants can easily be made to catch hold, if frequently sprayed with water.

In erecting the pillar it is best not to be in a hurry. Lay two, or at most three, stones and then let the cement harden. This will prevent any slipping. Equal parts of silver sand and cement will make a good medium.

If the stones or bricks are old and green, or moss-grown, as they should be, scrub them well with a stiff brush dipped in water wherever it is necessary for the cement to adhere, and do

not mix more of this very useful substance than you require for immediate use.

The cap-stone should be flat on top. This was easily managed in my case by grinding one stone on another, with water to aid the abrading, and a spirit-level is necessary to get it horizontally true. The use of a plumb-line in building the pedestal is not practicable in the case of an irregular outline. I ensured mine being upright by walking round it as I laid each stone, and observing carefully whether it appeared vertical.

It will be noticed that my capstone shows a certain amount of masonry. It was my first attempt, and was accomplished with an ordinary hammer and cold chisel; but in cutting stone be careful to have a very firm rest for the block you are operating on, and set the stone so that you are cutting horizontally.

And now for the dial. Most of the sundials I had seen had a metal face, but I had enough engineering knowledge to avoid, if possible, the wrist-racking task of graving a brass or copper plate, and it was a chance stroll through the churchyard that provided me with an alternative. Why not use slate? For I found myself gazing at headstones of this material seventy and eighty years old, absolutely unscathed by the weather.

An old roofing slate was sawn in halves. Use a fine-toothed saw for this, or repeated scorings both sides with a pointed knife-blade will ensure a clean fracture. The two portions were then ground together with a little fine sand and water, after which the dial was ready for marking out.

With regard to this task, all sorts of difficulties and insuperable obstacles had seemed to present themselves to me; but, in reality, they were non-existent.

One peculiarity must be noted here, and that is that the clock and the sun do not synchronise very frequently. For instance, on January 1 the sun is 3½ minutes behind the clock, and this interval gradually lengthens until February 12, when it is 14½ minutes out. Then the distance decreases until, on April 17, they are absolutely together. By May 16 the sun has gained 3½ minutes, after which they synchronise again on June 15. July 16 sees the sun 6½ minutes behind, and on September 2 the times coincide again. The greatest variation occurs by November 3, when the clock has been out-distanced by 16½ minutes, but Christmas brings, as it should, concord and unanimity, for on December 26 they again agree. All these variations are set out in extenso in any good almanac, such as Whitaker's, and should be available, as shown later, when setting the dial in position permanently. For graving the numerals and shadow-lines an ordinary penknife-blade answers admirably; but it must be frequently sharpened.

One very important feature is the gnomon or shadow-plate, which is usually of metal, brass being commonly used on small dials. It must be cut to an angle corresponding with the latitude in which it is to stand. For instance, Dover would be 51 degrees, Harwich 52, Nottingham 53, York 54, Newcastle 55, and so on. Reference to a reliable atlas will ensure this being correct. It has frequently occurred that a sundial has been moved from one latitude to another, when it has simply refused to work properly, to the surprise and indignation of its owner. An historical instance occurred as long ago as 263 B.C., when a famous Roman general looted a dial from a garden in Sicily and erected it in the grounds of his Roman villa, with most unsatisfactory results. In Dover museum is one of Roman workmanship, which when tested recently was, of course, inaccurate.

My gnomon I cut from a piece of brass ¼ inch thick which I found in my scrap-box; but, if economy is urgent, and brass is certainly at a high figure just now, iron, enamelled or painted, will do equally well. See that the edges are filed rectangular. Details of fixing can be gathered from the sketch, and if you have no mechanical ability, any engineering friend will quickly do

the job for you. I had mine all completed and ready for screwing on in less than an hour and a half. The shape is a matter for individual fancy, providing the angle of latitude is correct, or two suggestions appearing in the sketch.

First of all make a centre on the plate and scribe with a pair of steel dividers or compasses a 6-inch circle. Then rule a line through this centre, which must lie due north and south when in position; then two more equidistant and parallel lines which shall just cover the width of gnomon (see shaded portion of sketch). Points (a) and (b) should be about 1 inch from the centre, and these points are the most important of the whole setting out.

Do not cut hour-lines until after the dial is fixed in position.

The toe of the gnomon or style, as it is sometimes called, must just touch points (a) and (b) when screwed down.

Now, with dividers, take distances as given in sketch, and transfer them to the circle, making a small dot. This will give the approximate intersection of the hour-line protracted from either (a) or (b). Under these dots, or over them in the case of a big plate, cut the numerals, etc., and you will find, when completing, that the figures are in approximately the correct position. The gnomon is now screwed down to the dial, tested for perpendicularity with a set-square, and is then ready for fixing.

On the day selected—a sunny one, of course—look in *Whitaker's Almanac* and see what the variation is. Say, for example, the sun is shown to be 5 minutes in advance of the clock—i.e., the sundial will register 12 o'clock when it is 5 minutes to 12. Be sure your watch is right, and a few minutes before time wet some cement (pure this time), fairly sloppy, drop it on to the capstone and press the dial down on it, testing all over with a spirit-level to ensure a true horizontal plane, and get the shadow dead in the shaded portion at exactly 5 minutes to 12. Then leave it severely alone. Your job is done. Next day, or, better still, two days later, fill up spaces left under dial with more cement and dress the edges. All the foregoing applies to Greenwich time only. Should the reader wish to have actual meridian time, another reference to the atlas will give him the longitude of his locality, and he must simply add or subtract, as the case may be, 4 minutes to or from the clock time for each degree E. or W.

Now by watching his dial carefully the builder can gradually mark the actual line of the shadow for each hour, half hour, and quarter, not forgetting to refer to the variation for that day, and in the end he will find that the engraved numerals are in practically the correct position, and he will also find himself in possession of an instrument as accurate as it is possible for one to be. Be sure to rule lines from (a) for A.M. and from (b) for P.M. time, and use the curve of knife-blade near the tip, rather than the extreme point. Slate may be easily sawn with an old hand-saw, and the edges filed or ground to shape, so that a round plate, like mine, is quite practicable.

No article on a sundial can be considered complete without a few words on mottos.

Perhaps one of the commonest is "Perennet et impuntantur" ("They (the hours) pass and are reckoned"). Other suitable ones that might be mentioned are "Sic transit gloria mundi" or "Tempus edax rerum," a motto that will ultimately apply to your sundial, however well you build it. To the man who is inclined to be horticulturally procrastinative I would offer the following old Scotch monition, "Take tent of time ere time be tint."

For my motto I have chosen "Horas non numero nisi serenas" ("I number only the hours that are serene"); while in the child's slate which I have used to make another plate, is one which, freely translated, says, "Never a step backwards."

"Let not the sun go down upon your wrath"

has a homely warning that is particularly appropriate to the sweetness and beauty of a garden; while a sad, yet beautiful note is struck by my concluding examples. On the church dial of a peaceful little Surrey village can be read, "In coelo quies" ("In Heaven is rest"). To those who wish for a short motto I would suggest one which tells the story which all dial teach, "The night cometh." W. J. HENEY.

(white, with a faint blush and light purple disc), *D. nobile Cypheri*, and *D. nobile Statterianum*. Of the hybrids, *D. Cybele nobiliss* is one of the largest of hybrid *Dendrobiums* and fine in colour; *D. Apollo album* and *D. Rubens*, two extremes of the large-flowered section; *D. Ainsworthii intertextum*, cream-white, with purple disc; *D. xanthocentrum*, with rich orange-coloured centre to the lip; *D. Ophir*.

FIG. 53.—CONSTRUCTION OF A SUNDIAL; SHOWING DETAILS OF THE DIAL, GNOMON AND COLUMN.

ORCHID NOTES AND CLEANINGS.

DENDROBIUMS AT CHELTENHAM.

THE house of spring-flowering *Dendrobiums* is always a great attraction in the nurseries of Messrs. J. Cypher and Sons, Cheltenham, and this season they are especially fine. The forms of *Dendrobium nobile* range from the large purplish-crimson *D. nobile nobiliss*—one of the oldest and still the best-coloured form when the true plant is secured—to pure white. The best intermediate forms are *D. nobile elegans* (also an old variety and one of the best in shape and colour), *D. nobile murrhinaeum*

the charming fragrant hybrid between *D. aureum* and *D. signatum*, cowslip yellow with dark centre; and a pretty hybrid of *D. Rolfeae*, larger than but with the same features as the parent.

ODONTONIA BETESHAM.

THIS is a very pretty novelty raised, and now flowered, by C. J. Phillips, Esq., The Glebe, Sevenoaks, from seeds obtained by crossing *Odontonia Larresseae* (Miltonia Warscewiczii × *Odontoglossum crispum*) and *Odontoglossum illustrissimum* (*ardentissimum* × *Lambeauiannum*). The seeds were sown on July 8, 1913, and the first flower opened on March 20, 1917. The use of a good form of *O. illus*

trissimum as one of the parents has tended to widen the segments of *M. Lairesseae*, and introduce very effective shades of colour. The petals and sepals are broad, and overlap each other, the margins exhibiting undulation inherited from *Miltonia Warszewiczii*. The colour is brownish-orange on a lilac ground; the margins are lilac. The basal part of the lip has yellow and brown blotches; the rest is a shade of lilac.

VEGETABLES.

SELECT VEGETABLES.

I THANK *J. F.* for his information (see p. 115) respecting Haricot and Butter Beans. With reference to Kale, having grown all the varieties known to me, with the exception of *The Salvador*, which was once stated to be the best. I am rather surprised that there can be two opinions as to *Asparagus Kale* being the most useful and productive sort, given good cultivation and generous treatment. My trouble was to keep the young growths gathered and eaten fast enough; in pre-war days our poultry and pigs were given a few bushels of this vegetable to prevent waste. This Kale is always a good crop with me, grown at altitudes from 400ft. to 900ft. *J.*

LONGEVITY OF SEEDS.

In view of the scarcity of Vegetable seeds this season, any records of longevity will be exceedingly useful, especially as the scarcity may be even greater next season. It is rather difficult to estimate the age of seeds that have been purchased, as seedsmen do not always supply seeds of the previous year's growth.

Cabbage, Broccoli, and Savoy grow well when the seed is six years old, culinary Peas at two years old, Lettuce at two years, Melon and Cucumber at five years, Vegetable Marrows at three years. I have not tested Runner Beans, but have always been told they were of no use after the first year. This would probably apply also to dwarf Beans. I found that Tomatoes only gave a few plants after the first year. These were all kept in paper packets, placed in wooden drawers, in an airy room, where warmth was supplied in bad weather from hot-water pipes.

It is usually the custom amongst gardeners not to sow old seeds, and in view of the risk involved it was a good principle to act upon when new seeds could easily be obtained. We may now, however, be compelled to vary this rule, at any rate, for a time. *W. H. Divers, Westdean, Hook, Surbiton.*

POTATO CROPS.

DR. H. E. DURHAM's communication in your last issue opens up an endless question, but withal, a most interesting one. In the counties of Midlothian and East Lothian, where Potato growing is considered to be exceedingly well done by farmers, the usual distances for planting are:—Drills, 27 inches apart; sets dropped in at about 12 inches apart. To plant an acre at these distances requires about 19,500 sets, equal to about one ton of sets, averaging 20z. each. A good crop in the Lothians is 10 to 12 tons per acre, which is only equal to a return of rather under 1½ lb. per set. The average Potato crop for Britain is about 6 tons per acre, which is round about ¾ lb. of yield per set. In my notes in the *Gardeners' Chronicle* of December 30 (p. 312), I reported the yield at Wisley and at Edinburgh of nineteen varieties. Twenty sets of each of these nineteen were planted; the gross yield at Wisley was 1,043 lbs., and at Edinburgh 1,015 lbs. The average yield per set or root at Wisley was 2,745 lbs., or 2½ lb., equivalent to a crop of 14 tons 3 cwt. per acre. This is how it works out, taking the nineteen varieties altogether. Some of the sorts—notably Great Scott—showed a yield of nearly double that. Both at

Wisley and Edinburgh the sets were planted in drills 30 inches apart, and the sets were placed 18 inches apart in the drills. To plant an acre at these distances would require 11,760 sets. The cultivation at Wisley was spade cultivation. At Edinburgh the land was ploughed, but it is an old market garden, and there is no difficulty in getting a fine tilth 10 to 12 inches deep. My experience teaches me that in good land, strong-growing second early and Main Crop Potatoes require 3 feet between the drills and 18 inches between the sets to do themselves justice. Recently I had an interesting letter from Mr. John Fraser suggesting that I might turn my attention to raising Potatoes with dwarf, sturdier haulms for the special benefit of town-gardeners. Mr. Fraser pointed out that in confined gardens the present day Potato grew far too much to top, and the yield was often disappointing. It is just possible that one or two such varieties might be found in a batch of seedlings. Does not Mr. Molyneux think that with deeper cultivation, to get a better tilth, and wider planting, farmers might materially increase their average yield on a paying basis? *W. Cuthbertson, Daldrington, Midlothian.*

THE FLOWER GARDEN.

By *W. J. GRISE*, Gardener to Mrs. DEMESTER, Keele Hall, Staffordshire.

HARDY ANNUALS.—Sow hardy annuals in the open ground from now until the middle of May. In most gardens there will be a limited supply of bedding plants due to the scarcity of labour; still, very effective displays can be made by filling the beds or borders with hardy annuals. Many pleasing colour effects may be obtained by grouping or mixing, but simpler methods can be adopted. For instance, *Galearia*, *Lupinus*, *Eschscholzia*, *Nigella*, *Sweet Sultan*, or *Calendula* may be sown in rows 12 inches apart. The plants should be thinned out to the same distance. The taller varieties of *Larkspurs*, *Lavatera*, *Lupinus*, *Chrysanthemums*, *Crocus*, *Cornflowers*, and *Poppies* will require more space accordingly. For edging purposes suitable varieties are *Linarias*, *Linnanthus*, *Collinsia*, *Leptosiphon*, *Eschscholzia*, *Candytuft*, *Nemophila*, *Synmaria*, *Crocus*, *Linum*, and the Dwarf *Galearia*. If the beds have been well prepared, only a light forking will be necessary. Rake the surface to a fine tilth, and cover the seeds with sifted soil from the potting-bed. Guard against slugs by occasional dustings of soot.

HALF-HARDY ANNUALS.—Sow the seeds very thinly in boxes or pans containing a light sandy compost, and cover lightly with fine soil. A frame placed over a gentle hot-bed will answer the same purpose, but in either case very little heat is necessary. Directly they are large enough to handle, prick them out into boxes or frames 4 inches apart. The young plants should be encouraged to grow sturdy by careful ventilation, gradually hardening them off towards the end of May.

SUMMER BEDDING PLANTS.—Preparations should be made to remove bedding plants to cold frames. It is not advisable to retain the plants in warm houses too long, but one must be governed by the weather and district. Annuals in boxes should be placed near the roof-glass a week or so before being transplanted. *Pelargoniums*, *Marguerites*, and *Ageratum* may be placed in the Calceolaria frames directly they become vacant. Close attention must be given to watering and ventilation to prevent damping. Mats or other protective material should be ready at hand in case of frost. Continue to

dibble out seedlings into boxes or close frames whenever they are large enough to handle.

FORCED BULBS.—These should be packed closely in old frames as they pass out of flower. Continue to give them water until the foliage has died down. It will not harm the bulbs to remove the pots should they be required for other purposes. Daffodils can be planted on grass slopes, in shrubberies, and by woodland walks.

THE KITCHEN GARDEN.

By *J. DENN*, Foreman Royal Gardens, Windsor.

CAULIFLOWERS.—Cauliflower plants which have been wintered in cold pits should be hardened carefully and made ready for planting in some sheltered position as soon as the weather is favourable. While the plants are still in pots do not allow them to suffer from want of water at the roots. Early varieties, such as *Magnum Bonum* and *Great Dane*, should be planted in rows 20 inches apart and 18 inches between the plants in the rows. Early London and *Walcheren* may be allowed 2 feet each way. Water the plants thoroughly before their removal from the pots, and exercise great care in planting, so that the roots may not be injured. The soil should be made firm round the roots, and if necessary a copious application of soft water may be applied. If protection from rough wind can be afforded, so much the better. Young Cauliflower plants raised from early spring sowings should be pricked into nursery beds as soon as large enough and protected from inclement weather by placing spare lights over them.

PEAS.—A good sowing of Peas may be made now to produce pods about the end of June. Such varieties as *Gradus*, *Discovery*, *Royal Salute*, and *Superlative* should be allowed 5 feet between the rows. Sow the seeds thinly, so that the plants may not become overcrowded. Several varieties may be sown at one time, so that a continual succession of young pods may be available. As soon as one sowing is through the surface, another sowing can be made until the middle of June, when *Distinction* and *Antocrat* can be sown for late supplies. Young Pea plants should receive support as soon as they are of sufficient height to be earthed up.

POTATOS.—As soon as the weather and the state of the soil will permit, the planting of Potatoes should be pushed forward. The weather during the past few weeks has been against this work, but if the seed tubers have been laid out singly, and air freely admitted to the store rooms, the sets should be in good condition for planting when circumstances are favourable. With regard to the soil, although it may have been dug or trenched in winter, it will be necessary to stir it again to the full depth of the fork, and to break it thoroughly while planting. For Main Crop, and late, strongly growing varieties, 5 feet should be allowed between the rows and at least 15 inches between the sets in the rows, the tubers being buried 4 or 5 inches deep, according to the nature of the soil. Potatoes in pits should be freely ventilated during favourable weather, and a liberal supply of water given when necessary. In pits without fire heat, less water will be required, but a covering of some kind should be provided in frosty weather, or the foliage may be injured by coming in contact with the frosted glass. Protection should also be provided for the earliest plantations outside, and a careful watch kept over them as soon as they are through the surface.

CARROTS IN PITS.—Ventilation must be freely given to this crop. The final thinning should take place as soon as possible, leaving the plants about 3 inches apart each way. Occasional dustings of soot may be given previous to watering the bed with clear, soft water.

FRENCH BEANS.—If 8-inch pots are available, a sowing of French Beans should be made. Crook the pots carefully, and fill them to within 2 inches of the rim with good, rich soil. Eight seeds may be placed in each pot, and covered with 1 inch of soil. As soon as the plants are through the

surface, they should be raised to within 18 inches of the root glass and fully exposed to the light. A temperature of 60° is suitable, and the plants should be syringed frequently. Fortnightly sowings should now be made in order to keep an unbroken supply. Plants from which Buds are being gathered should be frequently syringed and occasionally watered with liquid manure.

FRUITS UNDER GLASS.

By JAS. HUTTON, Gardener to Mr. LEONARD DE ROHSCHILD, C.A. O., Gurnersbury House, Acton, W.

FRUIT TREES IN POTS.—Let fruit trees in pots have very close attention with respect to watering. Whilst an excess of moisture is harmful, the roots must not suffer for want of water. Watering should be very thorough, not a mere superficial moistening of the soil; and the frequency of application should be regulated by the condition of the weather. In sunny intervals some plants may get unexpectedly dry when growth is becoming active. Those in comparatively small pots may often need two, or even three, waterings at short intervals. Remember, too, that the soil in pots near the water-pipes will dry up more quickly than others. Do not yet commence to give manurial stimulants unless the fruits are well advanced. When Peaches and Nectarines are of the size of Hazel nuts it will be quite time to begin. Let the first application be of an artificial compound, containing plenty of phosphates and potash. The amount that can be held between the thumb and two fingers will be enough to begin with for pots of 12 inches in diameter. Repeat this about three times at intervals of a week. Then withhold the stimulant for one week, and water with clear liquid manure from the tan-yard well diluted at first. Pot fruits are, on the whole, setting well this spring. Last year there were many failures, both amongst pot trees and those in the open. Plums are setting as well as Peaches and Nectarines, but it is too soon to count upon pot Cherries. The blossom, however, is abundant, and looks very healthy. As soon as all the trees have safely set their fruits, give one fumigation as a safeguard against aphid and other pests. Do not attempt to hurry the Cherry trees. A few fruits may fall from these, as they often do on the open wall; but if the falling is excessive, it is an indication of too high a temperature.

THE COLD ORCHARD HOUSE.—The trees in this structure, if no fire heat is available, will be much later than usual this spring, but if careful attention is paid to the ventilation and the ventilators are opened when the sun is shining and closed early, so as to retain a little warmth, there should be no danger of not securing a good set. Keep the house quite dry whilst the trees are in flower, but do not let the trees dry at the roots. At this season the cold orchard house is a good place in which to start other batches of Strawberries, from which relays can be introduced into warmth as occasion may require. See to it that Strawberries still out in frames do not suffer for want of water.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

CALANTHE. The deciduous Calanthes that have been resting since flowering are commencing to make new growths, and should be repotted just as fresh roots begin to develop from their bases. Previous to repotting examine each plant, turning it out of its pot, removing all the rooting material from the roots, and shortening the roots to a sufficient length to hold the pseudo-bulbs firm in the soil. Thoroughly cleanse the plants of scale insects and mealy bug; this latter pest is found in clusters at the lower parts. In all these operations, take care not to injure the buds or young shoots. Remove the back pseudo-bulbs, leaving only those of the previous year. The pots should be almost half filled with clean crocks, for perfect drainage is essential, covering the crocks with a layer of rough Sphagnum-moss or half decayed leaves. The plants may be potted singly in 5 or 6 inch pots, or several

may be placed together in larger receptacles. Keep the base of the pseudo-bulb at least half an inch below the rim of the pot with the young shoot resting on the surface of the soil, but in no way cover the shoot; press the compost moderately firmly around the base of the pseudo-bulb. A suitable potting mixture is composed of one half rich, fibrous loam, broken up rather roughly, and with all the small particles removed; chopped Osunda-fibre, a little bone meal, dried cow dung broken up small, and Sphagnum-moss, adding sufficient coarse silver sand and crushed crocks to render the compost porous. After potting, use water sparingly until the new roots have developed well into the compost and have begun to cling to the sides of the pots, after which they will require copious supplies of moisture until the new pseudo-bulbs are fully developed. The plants should be grown in plenty of heat and atmospheric moisture, and should not be exposed to too much sunshine. The back pseudo-bulbs that have been removed may be employed to increase the stock. Arrange them on a layer of Sphagnum-moss in a shallow receptacle and place them in a warm, moist house, where they will quickly produce new growth.

PLANTS UNDER GLASS.

By J. G. WISDEN, Gardener to Lady Northampton, Maxwell Park, Kent.

HELIOTROPE.—Young plants of Heliotrope taken in autumn and now coming into bloom should be given short sticks to support the flowering shoots. Tie them up before they get too far advanced, and place them thinly in a light position, on a damp base, if possible. When the pots are filled with roots, see the necessity of giving extra water, and an extra feeding, and at intervals of water will be necessary, especially as the season advances. Half-timber plants trained in standard form have become very popular for arranging among a display of plants in the conservatory or show house, if only for their fragrance. To maintain a succession of plants in bloom, a number of the smaller ones should be pinched again and shifted into larger pots a little later. Cuttings taken now and inserted in ordinary sandy soil will root readily now, and will continue the succession right through the season. The variety Lord Roberts produces large heads of violet flowers, and is one of the best for general purposes. The Spider and Red and Neeps are both good varieties. The latter is, perhaps, the darkest of all.

THE FERNERY.—All the Ferns should be cleared out of the woodwork and glass washed, rock walls lime-washed or scrubbed, and all made clean before re-arranging the plants on the stages. Examine all plants to see if the drainage is perfect, and report any that may require it. A good, open compost is required, composed of rough turf, loam, peat, plenty of rubble, broken egg shells, charcoal, and sharp sand, so that the whole is thoroughly porous. Put very freely. The blinds should be in readiness to shade the Ferns after being distributed.

NEPHROLEPIS. The majority of forms of Nephrolepis exaltata are of strong and vigorous habit, and will repay liberal treatment. At this season, when Ferns are making new growth, plenty of atmospheric moisture should be maintained. Ventilate the house a little when the temperature rises above 65°, but shut the house early in the afternoon to conserve the sun heat. The temperature can then rise to 80°. Later in the season, when growth is practically completed, many Ferns are benefited by cooler and drier conditions. Some of the best of the Nephrolepis are N. toledoides, N. Whitmanii, N. Marshallii, N. Marshallii compacta, and N. superbiissima.

LATE CYCLAMEN. Two-year old plants now in full bloom should be kept quite cool, and shaded from bright sunshine. See that plenty of water is given at this stage. Any specially good forms selected for seed bearing should be removed from the main batch, and placed on a shelf in a light and well ventilated house. Reduce the number of blooms to ensure the maturing of a reasonable number of strong seed pods.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. F. DWYER, Abbots Wood to Felming, Surrey.

THE PEAR MIDGE DIPLOBIS PYRIVORA.—This pest, which of late years has been very prevalent and has done considerable damage, will soon be making its presence felt. Spray the trees (especially on south and south-west walls) with a weak solution of petroleum emulsion, which will destroy many midges in the larval state. The perfect fly appears during April, from eggs deposited in the flower by the fly while the trees are in bloom. The fly is very small, only one-tenth of an inch long. The female is busy depositing her eggs for three weeks or a month. She lays them in both the opened and unopened flowers. The petals are pierced and the eggs deposited on the anthers, and in a short time the fruits swell rapidly, turn a pale colour, and commence to drop from the tree. As an additional remedy and partial preventive, dress the soil under the trees with fresh soot or kainit. Doyenne du Comice, Williams' Bon Christian, Marie Louise, Jargonelle, and Pitmaston Duchess are among the varieties most liable to attack.

RED AND WHITE CURRANTS.—To combat attacks of the Currant moth, spray the trees with petroleum emulsion before the leaves are fully open. These moths begin their feeding and boring in April, or as soon as the foliage is sufficiently advanced.

FRUIT PROSPECTS.—The unusually severe weather we have recently experienced may have a beneficial effect on the crops, as it has retarded the too early development of flower buds. Many are quite six weeks later than last year. Should no very late frosts occur, we may expect a record crop of hardy fruits. In this district Apples and Pears are covered with plump flower buds, some of the flowers are on the point of bursting, while Plums, Damsons, and Cherries are also in first-rate condition. Those on warm walls will fare the worst if a severe frost occurs early in May. Strawberries appear to be growing strongly. If they have not already been mulched, no time should be lost in doing this necessary work, especially on light, sandy soils.

PEACHES AND NECTARINES.—Draw down the blinds each evening over the trees that are in flower, and remove them very early in the morning when there is no frost. Examine the foliage each day to see that no aphid is present, and the moment any is detected, take strong measures to exterminate it, or it will spread rapidly. For a spray or fine syringe, and apply strong solutions of quassia extract, which should be mixed with water at a temperature of about 70°. Spray every portion of the tree, and repeat the operation for several mornings. If mildew is detected, spray with sulphide of potassium at a strength of about an ounce to 5 gallons of water or dust the foliage with flowers of sulphur.

GRAFTS. Look well after newly grafted trees, and see that the grafting material is intact, the wood or sap may have displaced it. If the substance is missed over, it rarely requires a second doing.

STRAWBERRIES sown in February should now be pricked out into boxes or frames at about six inches apart, or potted up into 60-sized pots. Put them into a genial temperature for a week or ten days to recover from the shift, and then harden them off in frames.

GENERAL WORK. The work of pruning, tying and spraying should now be finished, and the disbanding of Apricots will soon claim attention, as the flowers are opening. Steps should be taken to pollinate some of the strongest flowers in the absence of bees. A rabbit's or a hare's tail on a stick is a good and expeditious way of distributing the pollen. The shoots grow very rapidly, and a disbanding should commence quite early. A little should be done about every two days. Some shoots must be removed entirely, and others stopped to make spurs. If cold, inclement weather and frost are anticipated, pull down the blinds, or other protecting material, for a few more nights, but do not use heavy, permanent coverings.

EDITORIAL NOTICE.

Editors and Publisher.—Our correspondents would oblige by delaying to obtain answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary Department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

Letters for Publication.—As well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer; desired signatures will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY, APRIL 19.

Manchester and N. of England Orchid Soc. meets.
Royal Society, 41, Abis (4.30 p.m.). Lecture by R. S. Pearson on "The Industrial and Economic Development of Indian Forest Products."

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 47.5°.

ACTUAL TEMPERATURE.—*Gardeners' Chronicle* Office, 41, Wellington Street, Covent Garden, London. *Thursday*, April 12 (10 a.m.): Bar, 29.0; temp, 41.5°. Weather: Cloudy.

SALES FOR THE ENSUING WEEK.

WEDNESDAY

Fruit Trees, Herbaceous Plants, Roses, Palmæ, Gladioli, Lilies, Ac., by Protheroe and Morris, at 67 and 68, Chancery, E.C., at 12 o'clock.

We offer no apology for again drawing attention to the series of pamphlets on War gardening issued by the Royal Horticultural Society.

The latest edition is in succession to others that have dealt with such subjects as "Economy in the Garden" and "The Cultivation and Manuring of the Soil," consequently it is devoted to the very important question of cropping. The authors have taken as an example an allotment of twenty rods (one hundred and fifty feet by thirty feet), and they have drawn up a scheme of cropping which is recommended as capable of yielding the largest amount of produce that can be expected from an area of the size mentioned. Being designed primarily for the present season, we are not surprised to find that about one-half of the area is reserved for main crop Potatoes, owing to the superior food value of the produce. The present scarcity of the coveted tuber is further recognised by the inclusion of early varieties which, in other circumstances, it is clear would have been omitted owing to their inferior

yield. There is almost an apology, too, for including two rows of Peas in the scheme, it being recognised that the yield per unit of area is so small that, during the war, they are to be regarded as a luxury crop. They are allowed here because it is felt that allotment holders have generally acquired the habit of growing them, but a hint is given that better value would be forthcoming from Broad Beans or Haricot Beans. There are few popular crops that are actually omitted, but amongst them is Celery, owing, it is said, to the plant being specially subject to disease. Many of our readers will feel some surprise that Brussels Sprouts are also discarded "because they give only poor returns."

For the rest, the forbidden crops are of little importance, and include Chicory, Salsify, Scorzoneria, and Dandelion. The last named, however, may be depended upon in many instances to put in an appearance unbidden. Having enumerated the exceptions, it is not necessary to name the chosen crops, which will readily occur to anyone, but as to their proportions it may be said that, following upon some consideration of the food values, the proportions are based on the conclusion that the four most productive crops are Potatoes, Parsnips, Beet and Artichokes. A plan is provided, and in this the plot is divided for convenience into two parts. There are numbers on the plan that refer to the crops listed, and in the lists or tables the following details are given:—Names of crops and varieties to grow, the number of rows of each, the amount of seed required, the time to sow, the distance of planting, and the time at which the crop should mature. Green lines in the plan show the position and number of rows of each of the main crops, red lines show the inter-crops (such as Broccoli and Kale, between rows of Potatoes), and black lines the crops that will be off the ground by mid-July, and so allow late summer sowing of crops for winter use.

For the convenience of those who intend to keep their allotments for a longer period a table is added showing how best to plant the crops next season, from the point of view, of course, of successional cropping. In addition to all this, each crop is dealt with under a separate heading, and a few apposite truths relating to their management stated in the briefest and simplest manner possible.

Experienced gardeners will not need such a guide as is afforded by this latest pamphlet, but amongst the many thousands who have assumed the responsibility of cultivating allotments this season for the first time there must be many who have no first hand knowledge whatever as to what relation the different crops should have to each other. For their instruction nothing could be more valuable than this little book prepared by the staff at Wisley, and it may be hoped that professional gardeners who may visit allotments for the purpose of giving advice to novices will take the opportunity of recommending it to those most in need of help.

"**BOTANICAL MAGAZINE.**"—The quarterly volume of the *Botanical Magazine*, containing the monthly parts for January, February, and March, gives illustrations and descriptions of the following plants:—

AMORPHOPHALLES KERRII, tab. 8,692.—A handsome Aroid from Siam, with solitary leaf, of which the petiole is over 5 feet long and the lamina 3-sect, each portion being sub-divided pinnately. The spathe is greenish yellow, marked on the exterior with greenish-white blotches. The ripe berries are deep blue.

CYRTIS ALBUS, tab. 8,693. The Portugal White Broom is a favourite in gardens because of its hardness. The history of the plant's introduction to this country on three occasions, together with the confusion relating to its classification and nomenclature by systematists, is dealt with at length.

COTONEASTER SALICIFOLIA VAR. RUGOSA, tab. 8,694. A graceful shrub from China, growing up to 10 feet high, and producing dull-whitish flowers in small corymbs, the blooms being succeeded by small, ovoid, coral-red berries.

QUERCUS DENSIFLORA, tab. 8,695. This Evergreen Oak is exceedingly abundant in certain parts of America, but is one of the rarest of cultivated Oaks in this country; yet it is described as being, in some respects, the most attractive of all the hardy evergreen species. The tree transplants with difficulty, a fact which may help to account for its scarcity here.

RHOODESIOIDES USULCOLA, tab. 8,696.—A large, white-flowered species from Western Hupeh, said to be the equal in beauty and fragrance to any of its immediate allies, and one of the latest of the group to flower.

MAURANDIA PERUVIENSIS, tab. 8,697.—This attractive plant is new to cultivation in this country. It is a native of Mexico, but may prove hardy in warm, dry situations. Plants at Kew have grown to a height of about 3 feet, but show no tendency to climb, as do most Maurandias. The flowers are rose purple, with a leaf-axils. The species promise a good plant for gardens.

SEXTETO MEXICO, tab. 8,698. At Ludgvan Rectory, Cornwall, this New Zealand Groundsel forms a compact bush 3 feet in height and 4 feet through. The flowers are developed in lax, corymbose heads, and are about the size and colour of the Ragwort.

PILSA FORGETTI, tab. 8,699. The foliage of this Venezuelan Urticaceous plant is very handsome, with shades of bronze, dark green, and yellowish green. The dense clusters of small, white flowers on the male plant are also attractive, raised on long pink stalks well above the leaves.

ANGULOA CLIFTONI, tab. 8,700. This species was introduced to cultivation by Messrs. CHARLESWORTH AND CO., who exhibited a specimen at the R.H.S. meeting on January 25, 1916, when the Orchid Committee awarded it a First-class Certificate. The petals are primrose-yellow, sepals deeper yellow, and lip tinged with cinnamon-brown.

BERBERIS STAPEFLANA, tab. 8,701.—One of the numerous Barberries introduced from China by Mr. E. H. WILSON. The small, ovoid, crimson berries ripen very late in the season—October and November.

CLERMAYNS FARGESII VAR. SOULEI, tab. 8,702.—This Clematis is a native of Western Szechuan, China, and a member of the Vitalba group. The flowers are white, and of delicate satiny texture. The plant is of great promise as a garden climber, and it continues in bloom from June to September.

MESSEMPHYSTEMUM PILLASSII, tab. 8,705.—The remarkable spatulate petals distinguish this species from all others of the genus. The plant was found by Mr. N. S. PILLASS in Cape Colony at an elevation of 2,000 feet, and Mr. PILLASS presented a specimen to the Cambridge Botanic Gardens, where it flowered in June, 1914. The flower heads are attractive in the outer purplish petals, each forming an elliptical-lanceolate blunt blade; the inner petals are shorter and white.

* The Cropping of an Allotment or Small Kitchen Garden. Royal Horticultural Society. Price 3d.

R. H. S. DAFFODIL SHOW ABANDONED.—In consequence of the continued inclemency of the weather the President and Council of the Royal Horticultural Society, acting on the advice of the Society's Daffodil Committee, have decided to abandon the special Daffodil show fixed for the 17th inst.

ALLOTMENTS IN BELFAST.—In Belfast 6,000 plot holders are at work, 4,500 having taken over plots since November last. The Department of Agriculture and Technical Instruction for Ireland has arranged for a course of popular lectures in Belfast on the cultivation of vegetables, insect pests, plant diseases, soils and manures, and has issued a pamphlet on Allotment Gardens in Belfast, by Mr. G. H. OLIVER.

SNAPDRAGON RUST.—Experiments⁸ made by Mr. W. L. DORAN on the effects of fungicides on rust of *Antirrhinum* lead to the following conclusions: Bordeaux mixture is useless. Eau céleste (copper sulphate and ammonia, 1 per cent.) destroys the spores of the fungus, but is apt to injure the foliage. Sulphur dusted on the plants interferes with the germination of the spores of the fungus, and hence is useful in the control of the disease.

MIDLAND DAFFODIL SHOW ABANDONED.—The Midland Daffodil Society's annual exhibition, originally fixed for the 26th inst. in the Birmingham Botanic Gardens, Edgbaston, has been abandoned. The committee has also decided not to hold the annual meeting this year; the officers for 1917 will continue in office during 1918.

MR. C. H. ROBINSON, representative of Messrs. J. BENTLEY, LTD., manufacturing horticultural chemists, has recently undergone a serious operation. His many friends in the gardening world will be pleased to learn that he is making satisfactory progress towards recovery.

THE FEEDING OF PIGS.—A valuable report on experiments with different feeding stuffs is issued by the University of Leeds. The need for experiment in this direction is particularly urgent just now owing to the high price of meals usually fed to pigs. In the Leeds experiments dried yeast was tried, with success. On two lots of ten pigs fed with five parts sharp to one of bran, to which food, after six weeks, a little barley meal and treacle were added in place of some of the sharps, the lot which had half a pound of yeast in place of that quantity of sharps gained 92 lb. live weight per head against 70½ lb gain of those which had no yeast. The addition of fish meal to the diet was also found to be of advantage, and it was also shown that Palm kernel cake could be used to replace one-fourth or one-fifth of the sharps. Those interested in pig keeping should procure a copy of the report.

SEED POTATOS FOR LONDON.—The *Times* reports that in the House of Commons Mr. FLAVIN asked the Secretary to the Local Government Board whether he was aware that numerous applications had been made to the London County Council for seed Potatoes by small cultivators in many parts of London, that all the forms and regulations had been complied with, and even the money paid for the seed Potatoes by the applicants over six weeks ago, and why many of these people had not yet received the seed for which they had prepared their plots of land. Sir R. WISELEY gave the following replies in Parliamentary papers: "The answer to the first and second parts of the question is in the affirmative. Part of the consignment has been delivered, and the greater part of the balance is now in transit. The weather during the past six weeks has been very unfavourable for bringing seed Potatoes from

Scotland, frequent frosts have interfered with the loading, and made the railway journey risky. The Potatoes in question are maincrop varieties, suitable for planting until the end of this month (April). In view of the present weather, it will be undesirable to plant the majority of the plots to which the hon. member refers before the middle of the month."

STUDIES OF THE GENUS PHYTOPHTHORA.—This genus of fungi comprises not only *P. infestans* of ill fame with Potato-growers, and we are all growers of Potatoes nowadays, but other species of destructive parasitic habit. It is, therefore, of great value to investigators to have an experimental diagnosis, such as is provided by Mr. J. ROSENTHAL. This author has studied the behaviour of the species under diverse nutritive conditions, and the table summarising the results which he has obtained should be very useful to the mycologist engaged in identifying species.

ORESITROPHE RUPIFRAGA.

ORESITROPHE RUPIFRAGA (see fig. 54) is a perennial belonging to the Saxifrage family, nearly allied to *Tiarella*, *Hemibeta* and *Paranassia*. It forms a woody root stock, and produces leathery leaves about 4 inches long by 3 inches wide, on petioles of about the same length. The white flowers are produced in March in panicles on stems about 6 inches high, and are persistent, like those of *Rodgersia*, turning to a greenish colour with age. The plant is a native of Northern China, and was first introduced into cultivation by Mr. F. MEYER, who found it growing in the Nankow Pass, and sent plants to Kew in the year 1915. Specimens first flowered at Kew in March, 1915, and the species is again flowering this year. It promises to be quite hardy, and when it has been propagated will be planted out. H. Z.

THE ROSARY.

SOME OF THE BEST DECORATIVE ROSES.

—IS a hot gravel soil one is forced to grow what one can, rather than what one will. But the following Roses have been very successful for the past two seasons:

Mrs. ARTHUR WANDERL. This very vigorous Rose with fine foliage, heads, in list, the deep copper and yellow flower, though on the thin side, being very beautiful and plentiful. I have known it equally successful on Essex clay and in sunny France, where it is highly appreciated.

Mrs. EDWARD POWELL. A beautifully shaped London Rose, verging on scarlet; a vigorous grower, with fine, dark foliage, a free flowerer, and the best all round red Rose I know.

ROUSSEAU. A very popular variety (for forcing especially) in America, and but little known in this country. Deep pink in colour, very free

⁸ "Controlling Snapdragon Rust," *Florists' Exchange*, March 3, 1917.

⁸ "Studies of the Genus *Phytophthora*," *Journal of Agric. Research*, VIII, 7, Feb. 1917.

flowering and weather-defying, and much admired here as an autumn Rose. Not that it does not flower freely all summer, but that in cold, wet weather, when the others are also finished, it carries on bravely and attracts attention.

LADY ALICE STANLEY.—Another fine bloomer of exquisite shaded pink, with bronze leaves. Not (with me) a vigorous grower, but, like Mme. E. Herriot, perpetually in flower. Its first bloom was hardly over when the second crop began, and it flowered from middle June to the end of July, rested in August, and flowered all the autumn. I even cut a handful of buds in Christmas week. A border of fifty plants, with Lavender as a backing and an edging of Pinks, was good all summer, especially as a thick planting of the Pink "Carnation Poppy," and the new lavender-hued Shirley, showed behind the Lavender hedge.

LADY HILLINGDON.—This variety is a wonderfully fine flowerer here, and the orange-coloured buds and red-brown foliage are much admired.

Everyone loves a crimson Rose, and I find very effective a big square bed of General MacArthur, with a dozen plants of George Dickson and George V. in the middle, the two last pegged down and throwing up over a dozen blooms to each shoot.

For cutting for tall vases, can anything be more beautiful than a long stem of Lady Waterlow, that superb pillar Rose? Such giant light-green leaves, and such a beautiful fluffy salmon-pink Rose.

That Rose of exquisite form and colour, Mrs. W. J. Grant, so "miffy" and disappointing in its growth, will make a splendid bedding Rose if the crimson variety be used, and it be pruned back each spring like an ordinary bush Rose.

PRINCESS MARY.—This single scarlet Rose is highly decorative in a mass, and has wonderful foliage. It is bound to be a great Rose for bedding.

ROSE MAE, EDOUARD HERRIOT.—This superbly-coloured Rose was a great success last summer, and did not seem at all affected by the cold, wet weather. Fifty plants were put out the autumn before, and provided cut bloom for the house from June till mid October. The bloom is thin and the colour soon goes in water, the glorious deep-coral buds or half-open Roses changing to a pretty coral-pink, loose-petaled flower. But nothing else evokes so much admiration as a table decoration or for bowls. Owing to scarcity of labour they were rather roughly treated, and planted very quickly on a wide kitchen garden border in rows, across which border a boy made a trench and shovelled in some manure on the other side of the row, so that there were alternate rows of Roses and manure. The plants did not make a great deal of growth, as they flowered too profusely to allow of that. Last autumn they were taken up and properly planted in trenched ground, and it will be interesting to see if they do well the second season or go off like some others of the same race.

Of the many new Roses shown at the R.H.S. last summer the following seemed to me the finest, but, of course, their habit of growth is yet to be seen, though many of them were described as "very perpetual." The finest yellow variety was Golden Emblem, almost the Rose the late Dean Hole sighed in vain to see. Mrs. C. E. Shea is a dazzling cherry-colour, while Cheerful reduced a stand of Mme. E. Herriot near it to comparative dullness of hue! K. of K. is a fine red garden Rose, and Flame of Fire, a brilliant orange, ran Mrs. C. E. Shea very close for the finest-coloured Rose in the Show.

Other lovely Roses were Golden Spray, semi-single, a yellowish-cream of Hugh Dickson's, who also had Charles Douglas, crimson, and Ulster Gem, yellow, single, that pleased me very much. Souvenir de Georges Pernet, crimson, and Chrome, Janet, a chamois-tinted Rose; Mrs. Willoughby, lemon and white; Christine, cadmium-yellow; Gladys Holland, cream and pink;

and Isobel, single, coral and yellow. *A. Martonau, Hurst, Berkshire.*

THE FROST AND THE ROSES

Now that the time has come when Roses have to be pruned—and although we may have no purely luxury gardening, we may snatch an hour to attend to Rose beds—it will be discovered, we fear, that the frost has done more damage than seemed to be the case. Although outwardly the shoots appear sound, the pith of many varieties has taken on an ominous grey colour which bodes no good. It is curious that the cortex of a plant should appear to be untouched and the deeper-lying pith destroyed. The observation is, perhaps, worth the attention of the plant-physiologist!

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

SUGAR FOR FRUIT-PRESERVING.—A few weeks ago I communicated with Lord Devonport on the subject of the provision of sugar this season for fruit preserving. He replied to the effect that "Private individuals will be well advised not to count upon any supplies other than those they can secure by saving from the ration allowed for domestic consumption." The subject of the provision of sugar having recently been one of considerable comment in the Press, it is reassuring to notice that Captain Bathurst stated in the House of Commons that "There is no intention to interfere with the legitimate saving from the domestic supply for the purpose of making jam." Householders have accordingly a clear line of action now before them, and it is hardly necessary to point out the wisdom of preserving as much fruit as possible this season. Amongst other reasons is, that the strain on butter production next winter will be lessened, and this may prove an important consideration in the future. It is true that Captain Bathurst also said: "As to the preservation of fruit, sugar, if available, would be supplied to domestic preserves," but I am strongly of opinion that as the matter all turns on "if available" we should do well to save now from our ration and not trust to the remote chance of more being forthcoming." *W. Wilks, Secretary, Royal Horticultural Society.*

WEATHER AT BRADFORD.—At 8 a.m. on Monday, the 2nd inst., during a blizzard, the thermometer registered 20°—32° of frost. We have had severe frost every night since the 2nd inst., until tonight, the 5th inst., when snow is falling. *R. Lambert, Mansfield Road, Bradford.*

THE "INCREDIBLE PROFIT OF DIGGING."—Whilst the fertile fields of France are being churned into sterile chaos by high explosives and the gentle German with his pedantic and silly obsession of thoroughness is destroying the fruit trees as he sullenly retreats, the soil of England is being subjected to the greatest upheaval that it has known for many a year. Thanks to the increased facilities for obtaining land now, allotments by the hundred thousand have been taken up, and at this Easter time no one can walk abroad without seeing the bent backs of armies of diggers. Although the eternal pessimist has been abroad among these people who are determined to ensure their food supplies by "digging themselves in," he has not been able to check their ardour. For that the sporting sense of the English is responsible. They know that they are a nation of amateurs, and not of experts, and are cheerfully prepared to undertake operations which others would embark upon only after much instruction and study. It is pleasant to reflect that this peculiar trait—so specially English—has high merit as well as grave defect. It makes an army as well as a Food Controller. It is giving them vegetable gardens which, though they will produce less than the diggers hope, will yield more than the pessimists proclaim. Sometimes, it is true, the unobservant sowing Parsnip seed on a windy day may not observe that the seed flies away as it is sown; but amateurs may be wise as well as foolish, and one of

the former, sowing Parsnips on Easter Sunday, was seen to be followed by a girl carrying a watering-can, and watering in the seed as it was sown in the drills. As is but natural it is the middle-aged and older people who, for the most part, are most active in digging just now. They understand the need better than the young, and, moreover, digging which is boredom to youth, is a diversion to the middle-aged. "There he sports are painful, and their labour, delight in them sets off." Gardeners everywhere are making it a matter of professional pride that the amateur enthusiasts of the spade shall have the benefit of their assistance, and besides giving set demonstrations, many of them are giving practical "at-homes" at stated times, during which inquirers may come and see and learn how to garden. Thus the keen and skilled gardeners on the staff of the London and South Western Railway are in their scanty leisure helping not only one another, but also the gardeners in their neighbourhood. Those who only think of food in terms of corn and meat do not regard all this multiplicity of effort on the part of small cultivators as meaning much. But they are wrong. It means a permanent addition to the fertility of the soil of this country, and it means, moreover, the acquisition of a greater thriftiness which, once learned, will be applied in many directions to the national benefit. One of the wisest of seventeenth-century men, "the most sensible, the least prejudiced great man of an age that boasted a galaxy of great men," Thomas Fuller, divine, historian, and wit, gave long ago the text for this present discourse, and one which we could wish might be preached from all the pulpits in the country:—"Oh, the incredible profit by digging of ground!" For though it is confessed that the plough beats the spade out of distance for speed (almost as much as the press beats the pen) yet what the spade wants in the quantity of the ground it manureth, it recompenseth with the plenty of fruit it yieldeth, that which is set multiplying a hundredfold more than what is sown." And the sequel is apposite. It is "incredible how many poor people in London live thereon so that in some seasons gardens feed more people than the field." *P.*

SOCIETIES.

ROYAL HORTICULTURAL.

APRIL 11. — The fortnightly meeting in the Drill Hall, Buckingham Gate, on Wednesday last was less important than usual, and there were fewer visitors. The four Committees sat, but only one award was made, by the Orchid Committee, namely a First class Certificate to a variety of Odontodia. The chief groups were those of Orchids, Tulips, Daffodils, and Alpine plants. Mr. ELISHA HICKS exhibited a new climbing Rose named Climbing Hillingdon, with the rich apricot-gold colour of Lady Hillingdon, and showed also some fine blooms of his novelty known as Mrs. Elisha Hicks, which he brought for the first time to the previous meeting. The exhibit of Tulips was the most imposing group in the show. It was staged by Messrs. R. H. BATH, LTD., and the plants, like those shown by this firm at previous meetings, were growing in bowls of moss fibre. Messrs. BARR and SONS displayed some excellent Daffodils; pot plants of Loveliness and Mrs. G. H. Barr were exceptionally fine. Amongst the cut blooms were fine flowers of the Trumpet variety Golden Chief, which resembles an enormous flower of Golden Spur; Golden Arrow, a Cyclamineus hybrid of the richest golden colour; and the old Santa Maria, whose deep yellow trumpet is a perfect shape, and the perianth segments curved somewhat after the manner of the blades of a propeller. Much admiration was shown for Mr. CLARENCE ELLIOTT'S exhibit of Alpines in pans, each of which was arranged to resemble a miniature rock garden, with pieces of stonework, and here and there a tiny Conifer to lend variety. There were no exhibits before the Fruit and Vegetable Committee, and as only three members were present, there would, in any case, not have been a quorum—an event which has not occurred for many years past.

Floral Committee.

Present: Messrs. H. B. May (chairman), W. J. Bean, J. Hudson, J. Green, T. Stevenson, J. Heal, W. Howe, J. F. McLeod, C. E. Shea, C. E. Pearson, J. W. Blakey, C. Dixon, C. Elliott, W. A. Bilyeu, H. Cowley, E. H. Jenkins, G. Paul and W. B. Cranfield.

GROUPS.

The following medals were awarded:—*Silver Flora Medal* to Mr. ELISHA J. HEKS, Tisbury, Berkshire, for *Roses*.—*Silver Banksian Medal* to Messrs. ALLWOOD BROS., Wivelsfield, Haywards Heath, for Perpetual-flowering Carnations. *Bronze Flora Medals* to Mr. G. REUTHE, Keston, Kent, for Alpines, and a new Rhododendron from China—*R. strigulosum*, with hairy stems and petioles, and rosy red flowers; and Mr. CLARENCE ELLIOTT, Stevenage, for Alpines.

Narcissus Committee.

Present: Messrs. E. A. Bowles (chairman), G. H. Engleheart, G. W. Leak, C. Bourne, F. H. Chapman, W. B. Cranfield, P. R. Barr, and C. H. Curtis.

GROUPS.

The following medals were awarded:—*Gold Medal* to Messrs. R. H. BATH, LTD., Wisbech, for Tulips growing in moss fibre. *Silver gilt Banksian Medal* to Messrs. BARR AND SONS, for Narcissus.

Orchid Committee.

Present: Messrs. Frederick J. Hanbury (in the chair), Jas. O'Brien (hon. secretary), J. Wilton Potter, R. A. Bolfe, T. Armstrong, Walter Cobb, J. E. Shill, R. Brooman White, and J. Charlesworth.

AWARDS**FIRST CLASS CERTIFICATE.**

Odontodia Coronation Orchid—*var. variety*, from Messrs. ARMSTRONG AND BROWN, Orchard Hurst, Tambridge Wells. A magnificent variety, with flowers nearly 4 inches across, and of fine form, the outer parts of the segments being cream white, the inner dark Indian red, and the bases of the petals white. The broad lip is cream white in front, with red markings around the yellow crest. The plant, with its four branched spike of forty-nine flowers, was one of the finest *Odontodias* ever seen.

GENERAL EXHIBITS.

Messrs. ARMSTRONG AND BROWN were awarded a Silver Banksian Medal for a group of very handsome seedling *Odontoglossums* and *Odontodias*, specially noteworthy being *Od. Royal Gem*, and *Cooksonia*.

Messrs. CHARLESWORTH AND Co., Haywards Heath, staged a group, in which the best novelties were *Laelia Cattleya Colombia* (Jeannette) (Wellsiana), a great improvement on *L. C. Gottoiana*, one of its ancestors, and with a very nice purplish crimson lip; and *Laelia Cattleya Circe* (Meippe × *Hypatia*), an interesting instance of colour development. In its ancestry are *Cattleya Trianae*, *C. Mossiae*, *C. Warszewiczii*, *Laelia purpurata*, *L. cinnabarina*, and *L. harpophylla*. The yellow in the last two predominates, and results in a clear chrome-yellow flower, with purplish-rose front to the lip.

Messrs. SANDER AND SONS, St. Albans, showed a selection of good hybrids, including four good white *Cattleyas*, the pretty *Odontodia Lada*, *Laelia Cattleya Joy Sander*, and a plant of *Laelia Cattleya Fried. Boyle* var. *Kerzhovae*, with two spikes of bluish white flowers.

Messrs. STEVART LOW AND Co., Jarvisbrook, Sussex, exhibited their new *Laelia Cattleya Cornus* (*L. C. Cornus* × *C. Eudis*) in colour primrose yellow, with a rose tint, the lip being reddish purple; *L. C. Calabaria*, light buff with orange disc; a fine scarlet *Soborinitis grandiflora*, and some cut spikes of *Vandas*.

Mr. J. E. SHILL, The Dell Gardens, Englefield Green, showed a fine plant of *Cattleya Lady Rowena* (*labiata alba* × *Suzanne Hye de Crom*), with large, pure white flowers of fine shape and substance; the disc and base of the lip are of orange colour, with white veining.

LINNEAN

MARCH 29—At the monthly meeting of the above Society, Sir David Prain, president, in the chair, Mr. W. BATESON, F.R.S., de-

livered a lecture, entitled "Prof. T. H. Morgan's Work on the Mechanism of Heredity," and summarised the results of recent work in America by Prof. Morgan and his fellow-workers on the cytology of the question, especially upon the fly *Drosophila*. The lecture was illustrated by diagrams and many lantern slides.

SCOTTISH HORTICULTURAL.

APRIL 3—The monthly meeting of this association was held at 5, St. Andrew Square, Edinburgh, on the above date, Mr. Phillips, the president, in the chair.

A paper on "Medicinal Plants and National Requirements," by Mr. R. CLUDE GUYER, was read, in Mr. Guyer's absence through illness, by Mr. Edgington. Mr. Guyer said that since the commencement of the war the cultivation of medicinal plants had been brought into great prominence; but, unfortunately, through a threatened shortage of a few very important drugs, a wrong impression had been created as to present and future needs. To co-ordinate and organise production a society had been formed, and it was to be hoped that the benefit of the experience gained would lead to success.

Mr. Guyer described in detail the proper methods of collecting and drying the plants, which are matters of paramount importance from the commercial point of view, and the marketing of the material. He then discussed the methods of cultivation applicable to the various kinds of plants, those required in large quantities being specially adapted to field cultivation, such as Poppermint, Fennel and Caraway, while *Aconite*, *Colchicum*, Foxglove, Chamomile, *Belladonna*, *Henbane* and *Valerian* were more suited to garden cultivation.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

APRIL 2—The monthly meeting of this Society was held in the R.H.S. Hall on Monday, the 2nd inst., Mr. Chas. H. Curtis in the chair. Two members were allowed to withdraw £26 4s. 10d. from their deposit accounts. The sum of £55 19s. 8d. was passed for payment to the nominees of five deceased members, all of whom were killed in action. The sick pay for the month on the ordinary side was £61 17s. 5s.; State Section, £11 11s. 8d.; maternity claims, £12. The suggestion to form a women section was again under discussion, and the secretary was instructed to communicate with the Commissioners for further information, which will be dealt with at the next meeting.

Obituary.

JAMES STREDWICK.—We learn with regret of the death of Mr. James Stredwick, of Silverdale Nursery, St. Leonards. Mr. Stredwick was one of the most successful exhibitors and raisers of *Dahlias* of recent times, and he also raised many fine *Chrysanthemums*. He took up the culture of *Dahlias* as a speciality about 27 years ago, as the result of a success he gained with this flower at a local show. Turning his attention to the raising of new varieties, he was successful in obtaining a number of good novelties, including one named after his son Harry. Others were named *Magnificent*, *Night*, *Eclipse*, and *Mayor Tuppenny*. He worked for a number of years at the improvement of the *Cactus Dahlia*, and did much to counteract the natural defects of the section. *Chrysanthemums* were in a secondary degree a speciality of his firm, and he raised several good new varieties, including *Mary Farnsworth*, which was illustrated in these pages on Nov. 20, 1909, p. 347, on the occasion of this variety's receiving an Award of Merit from the Royal Horticultural Society.

DAVID W. DUNCAN. *The Florists' Exchange* announces the death of Mr. David W. Duncan, florist, of Arlington, Massachusetts, U.S.A., on February 25, aged 51 years. Mr. Duncan was a native of Brechin, Forfarshire.

CROPS AND STOCK ON THE HOME FARM.

CABBAGE FOR CATTLE.—For cows and pigs, as well as for sheep and dairy cows, Cabbage is a particularly valuable crop. No other green crop can produce so much food for cattle on the same area. If Early and Late Drumhead varieties are sown early in April, the former will be ready for use at the end of September, and the late variety from November onwards. The heads will keep quite good until the end of February, thus maintaining a succession of food for five months. So hardy is the Late Drumhead variety that the severe and continued frost this season did not injure the heads here. The advantage of a Cabbage crop of, say, 50 tons per acre, when fed off by sheep, is that a heavy manurial dressing is left behind for the succeeding straw or Potato crop. These Cabbages are mild in flavour, and do not taint either milk or butter. Good seed costs from 3s. to 4s. per lb.; 1 lb. of seed is sufficient to raise plants to cover an acre. The seed bed should be in an open site, deeply and well manured. A fine tilth is necessary to ensure even germination of the seed. Previous to sowing, scatter superphosphate freely over the seed bed. Sow the seed thinly. When the plants are large enough to handle, they should be finally planted, the early variety in the second plough furrow, the later sort being given more space in the third furrow. Choose dry weather for planting, and dip the roots in a thick solution of soil and superphosphate or soot and water.

SHELTER FOR CHICKENS.—The present weather is most unfavorable for newly hatched chickens, especially where they are exposed to easterly winds. Many devices can be employed to provide temporary protection. In most gardens at this time of the year shrub pruning is an annual operation. The branches and clippings of Laurels, Yews, Firs and various conifers can be utilised, and will make quite a warm permanent shelter. On the north or east side of the site where chicken coops are placed, stout stakes, 3 feet long, driven in the ground 2 feet apart, allowing 1 foot in thickness for the shelter, make an easy and permanent support. Pack the prunings neatly between the stakes, and if there is danger from rats, small-meshed wire netting can be run round.

THE WHEAT PROSPECT.—In this part of South Hants, where grain of good quality is usually obtained, the Wheat crop this spring does not look promising, especially early sown plots after Clover on stiff soil. The trouble is, in my opinion, due more to the excessive rainfall during October, November and December than the severe frosts. For the purpose of effectively burying the Clover and preparing a good seed bed, we use the presser, with the result that such excessive amounts of rain as fell in October, November and December could not percolate quickly through the soil, but caused stagnation, resulting in weakened growth. Experience forces me to the conclusion that this method of Wheat-growing on stiff soil is wrong. Oats will be substituted for this crop next year, and the Wheat will be grown in fallow ground. A dry March favours Wheat in any soil, especially that which is heavy. Whether the customary harrowing early in April to break the caked surface of the soil, and afterwards making the plant firm with the roller will result in an improvement, remains to be seen. Some writers advise the use of sulphate of ammonia as a top dressing at the rate of 1 cwt. per acre, to give a fillip to growth. My experience does not warrant the use of this fertiliser, for while it produced an improved growth and colour in the straw and flag, the Wheat was of poor quality. The plant on the parts of the field light soil on which it was used had too many blighted ears. The Corn, generally, did not fill out, but remained "hoaty," or, as the term implies, hollow in the centre. My preference as a stimulant is 2 cwt. superphosphate per acre, scattered evenly previous to harrowing early in April. *E. Molyneux, Seacroft Park Farm, Bishop's Waltham, Hampshire.*

MARKETS.

COVENT GARDEN, April 11

We cannot accept any responsibility for the unaltered reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—Eos.

Cut Flowers, &c.: Average Wholesale Prices.

— of 6 trails .. 2 0-2 6	— Smilax, per bun. 2 0-2 6

Remarks:—There was a good demand for cut flowers throughout last week for the Easter decorations. Salesmen found no difficulty in clearing stocks, as all grades were in demand at advanced prices. Richardias (Arums) and white Lilliums were also in good demand, and prices rose considerably. The severe weather decreased the supply of Roses, Carnations and Violets. Home-grown Daffodils and Pheasants' Eye Narcissus and the large consignments from the Channel Islands (consisting chiefly of Bellflowers) sold freely at good prices. Many enquiries were made for white Tulips, but they are exceptionally scarce this season. Darwin Tulips, especially red ones, were cleared immediately the market opened, and buyers had to order in advance to obtain their requirements.

Vegetables: Average Wholesale Prices.

Artichokes, Globe s.d.s.d. per doz. 8 0	— Jerusalem, per cwt. 16 0-20 0
Asparagus, Paris, per Green, per doz. 2 9-3 0	— Broad Beans, French, per pad .. 6 0-7 0

— Horse-radish, per cwt. 66 0-72 0	— Kale, per bag 10 0 —
— Leeks, per doz. bun. 6 0 —	— Lettuce, Cabbage and Cos, per doz. 1 6-2 6
— Mushrooms, per lb. 1 6-1 9	— Mustard, per doz. punnets 2 0-3 0
— Onions, per cwt 18 0-18 6	

Fruit: Average Wholesale Prices.

Almonds, per cwt. 80 6-85 0	— Apples—
— Californian New to grow, per case 15 0-16 0	— E n g l i s h Cooking, per bush 17 0-18 0
— Main States, barrels 44 0-66 0	— Oregon, per case 18 0-20 0
— Bananas, Red, per ton 25 —	— Jamaica, per cwt 22 —
— Chestnuts, per peck .. 5 0-5 6	— Dates, per doz. boxes .. 7 0-8 6
— Grapes: Almeria, per doz. lb. 10 6-12 6	

REMARKS.—Supplies of Apples are decreasing. The Pears now available consist of Californian and Kent varieties, notably Williams' Bon Chretien, White Nellis, Clapp's Favourite, and Beurre Hardy. Forced Strawberries are still limited in supply. Numbers of Grapes are now on offer, including English Green Chatham and several Cape varieties, black, white, and red. Asparagus is now obtainable, mainly Paris-Groen, Cavalloni, and Lauris, besides some from English growers. Seakale is much scarcer. But Worthing and Greenwich Beans are fairly plentiful. Forced Man is in fair quantities. There are a few English Tomatoes on offer, and fair supplies of Broccoli (Garnish and Rosefin) are arriving. Flats containing 2, 25 and 5 dozen Celery are fairly plentiful, but the green-stuffs continue difficult to obtain. E. H. R., Covent Garden Market, April 11, 1917.

COMPENSATION FOR ACCIDENTS: Shrewsbury. The amount of damages you will receive as compensation for your disablement depends on many circumstances; among others, on the extent of the injury you have received. You should send in a formal claim to your employer for the amount to which you consider you are entitled, and he, in his turn, will send it to the society in which he has insured his risks under the Act—provided he is so insured. The amount to which you are entitled will be settled by the department in charge of such claims.

CUTTIMERS IN FRAMES: J. M. Collect a quantity of stable manure and leaves for a hot-bed, mixing them together in an open yard every second day. If box frames are used, the hot-bed should be at least 3 feet wider than the frame, allowing a margin of 18 inches all round on which to place fresh fermenting materials later. The seeds should be sown singly in small, clean pots and germinated on the hot-bed. Cover the pots with glass, and allow a small space for moisture to escape, but not sufficiently wide to allow of mice reaching the seeds. See that the bed does not become too hot through excessive fermentation or the seeds may be damaged

When the plants have made two rough leaves they may be planted on mounds of light, rich soil. As soon as roots show through the soil, pinch out the tops of the plants so that several leading growths may be produced from the base. Train the shoots on the surface of the bed, and stop them when they have grown to a length of about 18 inches. Before the shoots extend too far the bed should be made up with sufficient soil to carry the crop through the season. Careful attention must be paid to stopping and thinning the shoots, or the frame will become crowded with foliage. It is better to stop and thin the plants once or twice weekly than to remove large quantities of foliage at one time. During the growing and fruiting periods the plants may be watered freely with liquid manure. Admit air to the frame with caution—it is better to show the p't lightly on sunny days than to admit a large quantity of cold air. All The Year Round is a good variety for frame or pit culture.

LAND FOR A NURSERY: T. B. With reference to your desire to obtain land after the war for carrying on the business of a nurseryman and florist, we learn that there are no public funds available from which advances may be expected. With regard to the provision of land by County Councils for purposes of small holdings, these authorities are authorised by the Small Holdings and Allotments Act, 1908, to provide small holdings for persons who desire to buy or lease, and will themselves cultivate the holdings. Under Section 61 (1) of the Small Holdings Act, the expressions "agriculture" and "cultivation" include horticulture and the use of the land for any purpose of husbandry, inclusive of the keeping or breeding of live stock, poultry, or bees, and the growth of fruit and vegetables. If you write to the Board of Agriculture, Whitehall Place, London, S.W., for their leaflet No. 215, this will give you further information.

NAMES OF PLANTS: M. S., Cheshire. Brassia variegata.—W. A. T. Howe. 1, Acacia cyanophylla. 2, Acacia longifolia. 3, Acacia podalyfolia. This last is a rather uncommon species, illustrated in the *Gardener's Chronicle*, January 4, 1908, p. 11.—J. H. W. 1, Mackaya (Diella); 2, Adiantum formosum; 3, Microlepia (Davallia) platyphyllo.

NECTARINE FLOWERS FAILING TO SET: C. W. The branch you send is perfectly healthy, and the flowers well developed. The failure of the tree to set fruits is probably due to some check, most likely the result of hard pruning, which you state the tree received to prevent excessive growth. If the tree continues to make gross growth this season, it should be root pruned in the autumn.

RICHARDIA WITH DOUBLE SPATHES: C. W. S. The abnormality is not uncommon, and we frequently receive examples of these twin Arums. You will find a reference to the same phenomenon in the report of the Scientific Committee of the R. H. S. in our last issue, p. 147. It is probably the result of cultivation, the plants receiving more generous treatment than in a wild state.

Rose: Ditta. If the shoot to which you refer arises above the grafted part, it will flower, however many segments the leaf may possess. If, however, it appears to be of a totally different growth, with smaller foliage, it may have arisen from the stock, in which case your friend's advice that it be removed should be followed. It is usually a simple matter to determine whether the growth arises from the stock or from the scion. Suckers, as shoots from the stock are usually termed, always come from the base; they are generally very long, spiny, of pale green colour, and bear smaller leaves.

THE WEATHER.

THE WEATHER FOR MARCH.

March was a cold month with a low rainfall. Apart from the gales of the 4th and 5th there were no high winds. Snow fell on seven days, and lay continuously from the 6th to the 14th. The rain-gauge yielded 1.33 inch, collected during 17 days of precipitation, while the number of rain days (over 0.04 inch) were eight. The heaviest fall, of 0.92 inch, was on the 10th. Of sunshine we had 124 hours—an average of 4 hours per day, and a percentage of 35. There were eight stress days. The highest barometric reading was 30.410 inches, on the 15th, and the lowest, 28.966, on the 29th, the mean for the month being 29.831 inches. Temperature varied between 54°—the highest maximum on the 18th and 25th—and 49°, the latter being the lowest minimum, and recorded on the 9th. The lowest maximum was 33°, on the 7th, and the highest minimum 40°, on the 25th, while the means of the maxima and minima were 45° and 30° respectively. From these data we get a mean temperature for the month of 37°, a mean range of 13°, and an absolute range of 46°. On 17 days the temperature fell below the freezing point. There were 26 nights of ground frost, the most minimum on the grass being 26°, with a lowest reading of 4°, on the morning of the 9th. The means of the wet-bulb and dry-bulb thermometers were 34.8° and 56°, giving a relative humidity of 80 per cent. At 1 foot deep the soil temperature fell from 37° to 33° and then rose to 39°. The prevailing winds were westerly. James Wallace, St. Andrew's Training College Gardens, Kirkton of Mans, Dundee.

DEBATING SOCIETIES.

READING GARDENERS'. The subject of the sowing of vegetables in July and August was dealt with at the recent meeting of the above Association by Mr. H. C. Loader, The Gardens, Egham Park, Reading. Mr. Loader said that land might be treated in such a way as to produce two useful crops within twelve months, without undue strain, by the sowing and planting of vegetables in July and August on ground which had already borne crops of early Peas, Potatoes, Cauliflowers, dwarf Beans, Beets, or Carrots. For these crops the ground would have been well tilled and manured during the previous winter and spring, and therefore no much labour was required to prepare the soil. Early sowing was necessary for success. The lecturer then dealt with the varieties of vegetables he had found successful late in the season.

WARGRAVE AND DISTRICT GARDENERS'.—The second lecture on war-time gardening before the members of this Association was given on March 28 by Mr. C. Moore, gardener to Mr. W. E. Cunn, Wargrave Manor, and entitled "Croping the Allotment." A plan of a 20 pole plot was drawn on a large blackboard, and on it were marked positions for the various crops recommended. The lecturer dealt with the following vegetables, giving a short description of how to sow or plant, and mentioning the best varieties: Artichokes, Peas, early and late Potatoes, Parsnips, Runner Beans, Onions, Carrots, Beet, Broad Beans, Cabbage Marrows, French Beans, Shallots, Cauliflowers, Lettuces, Parsnips, and herbs. Inter-cropping and rotations were explained. The hon. secretary (Mr. H. Colday) advocated the formation of an Allotment Holders' Society, and outlined the method of proceeding for its establishment. A vegetable show for allotment holders and cottage gardeners is being arranged for the autumn.

GARDENING APPOINTMENT.

Mr. J. Watson Jun., for the past 10 years (as donor to H. GIBBERT, Esq. and H. MAX, Esq. respectively at "Easton," Kingston Hill, Surrey, as Gardener to W. P. WILSON, Esq., Psychone Court, Dorking, Surrey (Thanks for 2s for the R.G.O.F. box.—EHS.)

THE ROCK GARDEN

A practical work on the cultivation and management of Rock Gardens, written by Reginald Farrer. One of the best and most popular works on the subject.

Contains 8 plates in colour. Price 1/10 post free. THE PUBLISHER, The Gardeners' Chronicle, Ltd., 41, Wellington Street, Covent Garden, London, W.C. 2.

SITUATIONS WANTED.

Twenty-six words for 1/6, and 6d for each succeeding Eight words or less.

Gardeners desiring their Advertisements repeated must give full particulars, otherwise no notice will be taken of their communications. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. On no account should they enter into communication with unknown correspondents who require a fee beforehand.

Advertisers are cautioned against having Letters addressed to Initials at Post offices, as all Letters so addressed are opened by the Postal Authorities and returned to the Sender.

PRIVATE.

BALIFF or HEAD GARDENER; capable, wide business and trade nursery experience, with special knowledge of Hardy Plants and Rock Gardens, age 35, single, exempt, South preferred, good salary, P. Box 3, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD); first-class, expert—once in all branches, including Fruit, Vegetables, and Estate Management, age 48, no family at home, T. BENNETT, Maplehurst, Woodhouse Eaves, Loughborough.

GARDENER (HEAD); life experience, gained in large establishments, excellent references, single, married when suited, age 30 SAUNDERS, Martyr, Worthy, Winchester.

GARDENER (HEAD); first-class, expert; practical knowledge in every branch of Horticulture, with Estate management, if necessary, at liberty, A. B., Box 14, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD) or GARDENER BALIFF; age 46, fully experienced in the management of large Gardens and all kinds of Estate work, could organise for food production, disengaged, GARDENER, 23, Worston Road, East Grinstead.

GARDENER (HEAD WORKING) or GARDENER BALIFF; well up in all requirements of good establishment, thoroughly experienced, both outside and inside class, also landscape work, excellent references, 19 years' Head, age 48, married, no family, R. PRATT, Clayton Hall Gardens, Newcastle, Staffs.

HEAD WORKING GARDENER requires permanent situation, well up inside and out, over military age, long reference, near a town preferred, W. WHITE, The Homestead, London Road, Windesham, Surrey.

GARDENER (HEAD WORKING); where 2 or 3 Under Men are kept, life experience in good all round Gardening, can be highly recommended, age 38, married, no family, T. E., Box 6, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD WORKING) seeks engagement with lady or gentleman in good establishment, the experience in all branches and stock, age 38, wages, 5s, horse and fringe, J. SHIMPSON, 353, Notton Way, Letchworth, Herts.

W.M. CUTBUSH & SON have several first-class GARDENERS on their register who can be well recommended. Full particulars on application to Highgate Nurseries, London, N. 6.

LADY GARDENER; Inside experience chiefly, desires post under Head Gardener; good recommendations, quick and willing; Lancashire preferred.—BRADLY, Goswain Place, Birkhead, Cheshire.

LAD, aged 17, seeks Situation in Garden; good reference.—A BEAROCK, Trent College, Long Eaton Derbyshire.

TRADE.

MANAGER or INSIDE FOREMAN; A qualified to take entire responsibility; good references from up-to-date London and provincial nurseries.—F. H., Box 3, 41, Wellington Street, Covent Garden, W.C. 2.

FLORIST, FRUIT and VEGETABLE BUYER; 7 years' experience of Covent Garden; good knowledge of Market Nurseries; discharged soldier; active.—E. H. SEYMOUR, 6, Shaftsbury Avenue, New Barnet, Herts.

SEED TRADE.—TRAVELLER required by leading North of England firm of Agricultural Seed Merchants to represent them in Durham and North Yorkshire; permanent situation and good salary to thoroughly reliable man.—Write, stating age, experience and salary required, to F. S., Box 16, 41, Wellington Street, Covent Garden, W.C. 2.

AGRICULTURAL SEEDS.—Wanted, as Warehouse Foreman, experienced Man who understands Covers and Grasses and machinery for same.—Apply by letter, with full particulars of experience, references and wages required, to CHARLES SHARPE & CO., LTD., Seafood.

WANTED, MAN, for small Nursery; help in general work of same, speciality cut foliage, wages 38s.—CHIFFERFIELD, Hampton Hill, Middlesex.

WANTED, One or Two LADY GARDENERS, for work in a Curatorial Nursery.—Apply, stating age, experience, and wages required, to MESSRS. PERCY LOVELL & CO., LTD., The Manor Nurseries, Durrington, near Worthing.

SITUATIONS WANTED.

Twenty-six words for 1/6, and 6d. for each succeeding eight words or less.

Gardeners desiring their Advertisements repeated must give full particulars, otherwise no notice will be taken of their communications. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. On no account should they enter into communication with unknown correspondents who require a fee beforehand.

Advertisers are cautioned against having Letters addressed to Initials at Post offices, as all Letters so addressed are opened by the Postal Authorities and returned to the Sender.

PRIVATE.

BAILIFF or HEAD GARDENER (exp. 10 yrs.) req. for a fine and trade garden, exp. 10 yrs., with special charge of Hardy Plants and Book Gardens, age 37, single, except 8/6m. present, good salary. Apply, MISS WING, 101, Covent Garden, W.C. 2.

GARDENER (HEAD) or GARDENER BAILIFF, age 36, full experience in the management of large gardens and all kinds of Horticulture, could organize a good production, discharge GARDENER, 23, Milton Road, East Greenwich.

HEAD GARDENER, Superintendent in large establishment, exp. 10 yrs., in charge of all the work, with special charge of Hardy Plants and Book Gardens, age 37, single, except 8/6m. present, good salary. Apply, MISS WING, 101, Covent Garden, W.C. 2.

GARDENER (HEAD); full experience in all work, superintending of all departments, including landscaping and planting, and care of choice Trees and Shrubs, Rockeries, and Water Gardening, and the general routine of a small estate, is open to negotiation with the lady of gentleman then is wanting a position of man with good experience, energetic, and reasonable, age over 50, family from home, good house, and wages required suitable to position, highly recommended from previous employer, would like to place wife, family of six or seven children. An interview preferred. MANAGER, Box 21, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD) and MANAGER; small Estate in England, 20 years' experience, 12 years as Head here, holder of B. Com. Agr., and all Horticultural certificates, as a result of some instruction. G. GRIMMER, Norton Manor Gardens, Sutton, Surrey, Surrey.

GARDENER (HEAD, where 3 or more are employed) full experience in all work, including all departments of Horticulture, including design and Apron Work, intelligible, married, wife, wages 40 WHITFIELD, 11, Blaylock Cottages, Maidenhead, Berks.

GARDENER (HEAD); first-class expert; practical knowledge in every branch of Horticulture with Estate management if necessary; at liberty—A. B., Box 14, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD WORKING); 47; life experience, or GARDENER BAILIFF; stock and poultry cabinet-maker, no family; excellent references—J. L., Box 22, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD WORKING, where 2 or 3 more men are kept); life experience in all branches of Gardening, can be highly recommended, age 47, married, no family—T. E., Box 20, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD WORKING) or GARDENER BAILIFF, well up in all requirements of good establishment, thoroughly experienced both outside and inside Glass, also Landscape work, excellent references—44 years, age 42, married, no family—R. PRATT, Clayton Hall Gardens, Newcastle, Staffs.

GARDENER (HEAD WORKING, where 2 or 3 more men are kept); life experience in all branches, 2nd references, married, age 48, J. HARWOOD, 6, Robinson Road, Preston Park, Brighton, Sussex.

G. H. Y. SHOEBRIDGE seeks SITUATION as HEAD GARDENER in good establishment, life experience in all branches, 34 years as Head, intelligible, no-24244. C/o Mrs. PRING, Stamford, near Rugby.

FOREMAN (INSIDE) BONDERS, SITUATION; 10 years' experience in large establishments, excellent references, age 42, 28/6 wages, no-24244. Apply, A. J. DEW, Tongue of Garden, Huddersfield, Yorks.

GARDENER; good at Vegetables, and all kinds of Horticulture, age 32, single, and paid 12/6 weekly, 20/6 wages, no-24244. Apply, A. J. DEW, Tongue of Garden, Huddersfield, Yorks.

DISCHARGED Soldier BONDERS, SITUATION; 10 years' experience in large establishments, excellent references, age 42, 28/6 wages, no-24244. Apply, A. J. DEW, Tongue of Garden, Huddersfield, Yorks.

YOUNG MAN (intelligible) seeks SITUATION as GARDENER in good establishment, as JOHN NEWMAN, 10 years' experience, inside and outside, age 21, 12/6 wages, no-24244. Apply, MISS WING, 101, Covent Garden, W.C. 2.

LADY GARDENER requires Position; 10 years' experience in all work, with special charge of Hardy Plants and Book Gardens, age 37, single, except 8/6m. present, good salary. Apply, MISS WING, 101, Covent Garden, W.C. 2.

LADY GARDENER requires Position; 10 years' experience in all work, with special charge of Hardy Plants and Book Gardens, age 37, single, except 8/6m. present, good salary. Apply, MISS WING, 101, Covent Garden, W.C. 2.

MRS. LEOPOLD SALOMONS, former Head Gardener, seeks Position; 10 years' experience in all work, with special charge of Hardy Plants and Book Gardens, age 37, single, except 8/6m. present, good salary. Apply, MISS WING, 101, Covent Garden, W.C. 2.

FOUR LADIES, 6 weeks' training, Veg. and Flowering, from May 1st to Garden Hand, 10/6 weekly, 20/6 wages, no-24244. Apply, MISS PORTER, 11, Blaylock Cottages, Maidenhead, Berks.

TWO LADY GARDENERS requires Position; 10 years' experience in all work, with special charge of Hardy Plants and Book Gardens, age 37, single, except 8/6m. present, good salary. Apply, MISS WING, 101, Covent Garden, W.C. 2.

TWO LADIES, 6 weeks' training in Veg. and Flowering, from May 1st to Garden Hand, 10/6 weekly, 20/6 wages, no-24244. Apply, MISS ALKON, 11, Blaylock Cottages, Maidenhead, Berks.

TRADE.

SITUATION, required immediately, as CHIEF HAND, 16 years' experience, at a large estate with an orchard, Tomatoes, Cucumber, and Chinese in the house, on to Market Garden, age 40, single, age 31, Address, GROWER, Box 27, 41, Wellington Street, Covent Garden, W.C. 2.

GROWER Cucumber, Tomatoes, and general fruit, Nursery produce, over military age; good references, at liberty, no fault of own through leaving present situation. GARDENER, c/o Mrs. Colles, Bradninch, Devon.

FOOD PRODUCTION.—Gentleman (intelligible), with some previous practical experience, requires employment on Fruit and Vegetable farm, where other gentlemen or ladies are employed, usual wages, or in lieu board and lodging, experience would assist in approval, well-established concern later. Address, D. R., Box 21, 41, Wellington Street, Covent Garden, W.C. 2.

FLORISTS.—Young Lady requires re-employment; over 12 years' experience, Designs, Bouquets, Wreaths, Plants, some previous work, Bouquets, Letters, MISS FLORAL, c/o 23, Graham Road, Worthing, Sussex.

The Gardeners' Chronicle SCALE OF CHARGES FOR ADVERTISEMENTS.

Advertisements intended for insertion in the next issue MUST reach THE PUBLISHER not later than WEDNESDAY, 5 p.m.

Table with 3 columns: Description of ad type, Rate per line, and Total cost. Includes Ordinary Positions, Farming matter and Bank Page, Half and quarter pages, 4 line space not exceeding 20 words, 50 inch, single column, 50 inch across 2 columns, 50 inch, across 3 columns.

Front page (no display allowed) 1/4 per line space. Headline counted as two lines.

For discounts apply to address below.

SITUATIONS WANTED. 26 words 1s. 6d., and 6d. for every additional 8 words or below. These Advertisements must be prepaid, AND APPLY ONLY TO GARDENERS, &c., OUT OF EMPLOYMENT.

Table with 2 columns: Subscription type, Rate per annum. Includes THE LITTLE KINGDOM, 15s. per annum, and ARMSAD, 17.6.

Chèques and P.O.s to be made payable to "GARDENERS' CHRONICLE," LTD., 41, WELLINGTON STREET, COVENT GARDEN, LONDON, W.C. 2. Telegrams: 1533 "GARDENERS," RAND, LONDON." Telephone: 1533 GERRARD.

ONLY TO ORDER.

In consequence of the decision of the Board of Trade, which will come into force on May 1st, to prohibit the return to publishers of unsold copies of any journal, the GARDENERS' CHRONICLE will be obtainable after that date only if ordered beforehand. We ask, therefore, all readers who desire a copy each week (and are not already receiving it direct from this office) to give their local newsagent a definite order to this effect.

ORDER FOR NEWSAGENTS. To Mr. Newsagent.

Please deliver the GARDENERS' CHRONICLE to me each week at the address given below.

THE EFFECT OF FROST ON LILIUM BULBS.

A POST BAG contributor writes to the editor regarding the effect of frost on the bulbs of Lilium, and states that a good deal of interest is taken in the subject, still, and, in fact, to prevent an account of the position.

On the above subject, and seeing that the subject is concerned, the genus Lilium, is a considerably hardly one in the literal sense of the word, as distinct from the interpretation that has been rather loosely placed upon it of late years in horticultural circles.

In the *Monograph of the Genus Lilium*, the geographical distribution of Lilium is given as from the 10th parallel to about mid-way between the 60th and 70th, not so very far from the southern limit of the Arctic Circle. By far the greater number of species is native of countries in which the winters are long and normally severe, and only two, *L. non-chlorinum* and *L. philippense*, have been found within the tropics. They are out of the reckoning so far as British gardeners are concerned, and so is the group of sub-tropical species, though not for the same reason.

In the case of the last-mentioned section it is not so much the effect of frost on the bulbs that makes their cultivation in the open such a one-sided gamble, as the fact that being either precocious or tardy, their normal season of growth places them at the mercy of the weather at a time when it is almost fatal to the element.

That is what renders the garden cultivation of *L. longibrum*, for instance, impossible in Great Britain for the young growth is almost certain to be cut down between the beginning of March and the end of May. Others, again, are so late in growth that in normal seasons the leaves are falling off the trees before the plants have been able to open their flower buds, and *L. sulphurum* is a case in point.

An enumeration of this section includes, besides *L. longibrum* and *sulphurum* at opposite ends of the scale, *L. nepalense*, *L. Wallingianum* and *L. Thomsonianum*, as well as *L. Downi* and the other Burmese Lilies.

The degree of cold the bulbs of many species normally bear in their natural habitat is as forthcoming, and is certainly never reached in this country. The Manchurian species, for instance, of which *L. tenuitubum* is best known to cultivators, probably suffer a lower temperature than other Lilies, though in parts of Canada *L.*

philadelphicum run them close. The European Lilies, among which the Martagons predominate, are all frost-proof, and bulbs of *L. candidum*, chalcidonicum and croceum, as well as *dalmaticum*, *ponponium*, *pyrenaicum* and *Szovizianum* may be frozen tight without hurt.

One may say the same of many of the Japanese species—even those of the southern half of Honshu—and both *L. speciosum* and *L. auratum* are frozen to an almost unbreakable ball of ice without permanent injury. *L. Hansonii* takes no account of cold, nor *L. Batemaniae* either; *L. japonicum* and *rubellum* do not seem to mind it, while *L. cordifolium*, *L. Glehnii*, and the diminutive *L. melolobodes* are as hard as nails. It has long been known that bulbs of *L. tigrinum* may be exposed to very severe cold without coming to any harm.

L. auratum, *macranthum* and *speciosum* might seem to be wild plants of islands off the southern coast of Japan, and one might suppose that they would almost certainly be injured by extreme cold. Yet a score of bulbs of each species in pots, purposely left out in the open last January and February with nothing between them and the heavens, are now growing strongly. Eight weeks ago they had been frozen so hard for more than a month that it was impossible to examine a bulb without first of all thawing out the pot and its contents.

In common with many Chinese plants of more or less recent introduction, *L. regale* is just coming from its first experience of the rigours of a severe British winter, and if other plants from the same country turn out to have been so little affected as this one, gardeners may well rub their hands together. Seed, seedlings, and mature bulbs alike have come through an ordeal that tried man and beast very severely, and almost seem the better for it. The same may be said of *L. Willmottingii*, for a basket of bulbs of this species intentionally left on the top of a wall, fully exposed, and with nothing to shield them from wind, rain, snow, and all the other terrors of last January and February, were turned into glistering balls of ice for weeks on end. Incidentally, the bulbs underwent a color transformation, changing from white to purple, but that had nothing to do with the matter, and is a point of minor importance. It is a pity that the bulbs of February some of these bulbs should have been of pure white, for the effect of the frost seems to show that retrogradation does not spoil their visible qualities.

Other Asiatic species that are not embarrassed by low temperatures are *L. Henryi*, in a lesser degree, *L. Sargentianum*, and the so-called *L. Brownii* group. *L. polyphyllum*, from the Himalayas, survives, and no one need have any anxiety about *L. griseum*, even though as a rule the bulbs are only just below the crust of the earth.

It is not possible to speak with so much confidence of all the North American Lilies, though *L. canadense*, *Grayi* (see 55), *suprum* and *philadelphicum* are able to stand anything they ever get in the way of cold in this country.

It is among the Lilies of the Southern and Western States that one must look for victims in winter, such as that now dying to a close in such dazing fashion, and neither the Washington Lily nor *L. tuberosum* has come through the ordeal any too well. Though by no means moribund, the bulbs of these are charred and have obviously had a serious shock. *L. Kelloggii*, *L. columbianum* and *Belanderi* Lily have been crippled, but in a minor degree; *L. parvulum*, in all its many forms, is unharmed, while, contrary to one's expectation, *L. Parryi* (see 62, 56) shows no hurt. *L. Catesbaei* is the only species that appears to have been actually killed by the frost, though *L. carolinianum* has had a narrow escape.

When the mercury falls to within a notch or two of zero, and to flesh and blood the wind seems far below that numbing point, no amount of covering serves to keep frost out of un-latched frames; a few weeks since frame thermometers were registering a state of affairs that prepared one for the discovery of pans and their contents frozen to a solid block. The result has obviously been a temporary setback, but it is equally obvious that no permanent harm has been done.

The foregoing notes refer to Lilies that have come under the writer's observation. They include all species in ordinary cultivation, as well as many, not specifically mentioned, that are not yet commonly met with in gardens. It is unquestionable that in the first two months of the present year the bulbs passed through a crucial test, for in the case of every one the ground was frozen hard to a point well below them. *A. Groom, Kenton's, Upper Calham, Berks, April 15.*

THE MARKET FRUIT GARDEN.

AWKWARD ALLINGTON.

ALLINGTON PIPPIN is a healthy growing Apple and a great fruiter in alternate seasons. But its habit of growth is more awkward than that of any other variety grown by me. It sends out a prodigious number of slender laterals at all angles, and often pointing downwards. Unless these are thinned out annually, a tree becomes a thicket of branches. As the variety produces a superfluity of natural fruit spurs, there is no need to prune for artificial spurs, and the best plan is to cut off all superfluous laterals close to the main branches. The leaders should be left entire after a tree is well furnished with branches, as the difficulty is to get sufficient upward growth. Summer pinning is particularly desirable for this variety, to prevent the waste of sap by cutting out cleanly all superfluous laterals as soon as they have started, and thus concentrating the vigour of a tree upon the leaders, which are apt to be too slender. The only other variety in my orchards which has a similar habit of growth is *Lancis Prince Albert*. With this variety there is the same tendency to throw out laterals in wrong directions, but this Apple is a much less vigorous grower than Allington, and is less liable to become densely crowded with laterals. Its treatment, however, should be the same as that described above.

GRASS ORCHIDS AND ISSUES.

The note on this subject from Mr. W. H. Davies on p. 119 is interesting. He does not suggest any reason for immunity from caterpillars of the winter moth and aphides in grass orchards when arable orchards near by were attacked. Possibly it is because trees with plenty of sappy wood are preferred by aphides when depositing their eggs, and the abundance of such wood would be greatest on cultivated ground. Certainly they attack young and sappy trees more than old trees with less tender new growth on them. This explanation is the only one that I can suggest in relation to the aphids. As to the winter moth caterpillars, it may be that they have more difficulty in burrowing into the solid grass-land than into the soft cultivated soil when they fall to the ground to pupate, so that many of them become the prey of birds before they can bury themselves. It would be interesting if other growers would state whether they have observed the difference mentioned by Mr. Dyer, also, whether they have found more or less immorality of grass than in arable orchards.

WINTER SPRAYING.

Winter spraying is most likely to prove effective against aphides and Apple-suckers, if it ever is so, just before the fruit buds open. Lime alone, 2 cwt. to 100 gallons of water, is

now the favourite specific, as it is believed to impede the action of aphides so that many of them perish, if it does not kill them outright. But lime-spraying is a laborious operation, and few growers, it is to be feared, have enough hands at the present time to carry it on extensively. As for lime-sulphur, which can be applied more expeditiously, it is not a good insecticide, and after a prolonged experience in its use, I cannot say that I am convinced that it has any material effect in the extermination of either aphides or Apple-suckers. Lime alone was used by me last year, but it was not a great aphid season, even for un-sprayed trees, and Apple-suckers were as numerous as usual in my orchards. My preference is for lime-sulphur, because it is a fungicide, and there is the hope

a serious matter where trees are to be profusely wetted, as they should be in winter spraying. The winter strength of lime-sulphur should not be used after the foliage has developed; but I have often applied it with impunity when fruit buds were on the point of opening. There will be no time for the winter spraying of Plums in my orchards this season, other than Monarchs, which were done some time ago to prevent bud-eating by birds. There has not been any bud-eating worth notice at present, but whether this immunity has been due to spraying or to the scarcity of budlinches in my district cannot be stated.

UNRIPE APPLE SHOOTS.

Unripe Apple shoots of last season's growth

voted to them. An Orange house should be well lighted, ventilated, and lofty.

In 1915, through the courtesy of Messrs. Rivers, who grow Oranges extensively, I was able to get a few grafts to put on some Lemon seedlings I sowed the year previously. The varieties were St. Michael's, Sustain and Embigo; they were put on in January, and grew apace. Last year (1916) I allowed them to carry fruit for the first time, which finished to perfection. The fruits were large, clean-skinned, with a very thin peel, deliciously flavoured, and full of juice. My largest fruit was 10½ inches in circumference, and weighed slightly over 9 ounces. The size of the pots varied from 6 to 8 inches. The compost is made up of equal parts loam and well-rotted leaf soil, with a

FIG. 55. *LILUM GRAYI*, ONE OF THE HARDEST OF THE NORTH AMERICAN LILIES. COLOUR OF FLOWERS REDDISH-CRIMSON (See p. 159)

that it may do something to check the development of cank and brown rot, particularly of scab on the wood, to prevent it from sending out spores to infect the leaves, from which the disease extends to the fruit. But there is so much uncertainty as to the efficacy of winter spraying against insects or fungous diseases that I should be disposed to give up a tedious operation which takes men from other important work, if it were not for the desire to cleanse trees of moss, which lime-sulphur of full strength does well. If the concentrated fluid tests about 72 Baumé, as factory-made lime-sulphur should (and as that of my own making does), I use it in the proportion of 1 to 12 of water. If nicotine were added, the mixture would be improved as an insecticide; but the costliness of this addition is

are uncommonly numerous. The wet weather and lack of sunshine experienced last autumn supply a probable explanation. *Southern Grower.*

ORANGES.

In private gardens good use could be made of some of the houses by growing fruits of the Citrus family, such as the Orange, Lemon, and Lime; by means of a few trees a crop of fruit could be grown much superior to imported fruits. Those who take up the cultivation of Oranges should grow only the best varieties. For the sake of convenience the plants should be grown in pots instead of being planted out in borders, unless a structure is entirely de-

sprinkling of charcoal and a little sand to give it porosity.

I endeavour to ripen the fruits under twelve months by starting the trees in January; fire-heat is used only early and late in the season, but we make as much of the sun's rays as possible in between. The trees are watered and syringed with rain water until the fruits show colour, when syringing is discontinued, and a drier atmosphere kept, with only sufficient water to keep the trees healthy. The fruits finish ripening here in a temperature of 55° to 60°, never higher. The trees have sufficient ventilation at all times. Soot-water and a little Clay's are all the stimulants given. After the fruit is cleared, the trees should be sponged with Quassa Extract or soft soap, and removed to a lower

temperature for a little rest before being started again. A temperature of 45° will suit them nicely.

If re-potting is required, this should be done after growth commences, and over-potting should be strictly avoided. In the early part of the season my trees are grown in an ordinary plant stove. Once a week a little Quassia Extract should be mixed with the syringing water; it will help to keep scale insects in check. A tree or two of the Seville or marmalade Orange should be in every collection. I have this year grafted some new varieties, and they are now pushing their growth.

When well grown, Orange trees are amongst the most attractive of plants, their glossy, evergreen foliage making a magnificent foil to the fragrant flowers and golden fruits. *Thomas P. McPhail, Horticultural Student, The Horticultural College, Surrey.*

ON INCREASED FOOD PRODUCTION.

PUMPKINS AND SQUASHES

As the present scarcity of vegetables is probably more at this time next year, my vegetables will be more numerous than at present consideration. The Pumpkin is not very common in this country, though in the Austral and Colonies, in South Africa, and in America it is second only to the Potato in importance as a food crop. Pumpkins or Gourds, including Squashes, are easily stored, and keep well for ten months or more. They provide a welcome change, and besides being eaten as a winter vegetable can be cooked in many ways. Pumpkin pie being especially good. They are easily grown, the treatment being much the same as for Vegetable Marrows. To get fruits of the largest size in this climate the seeds should be sown in February under glass, but this may be sown now in heat and gently forced on, hardened off, and planted out at the end of May or beginning of June, and if possible, a cloche over the young plant for a week or so after planting. If a cloche is not available, large pots or boxes placed over the plants at night will serve. When established, if the weather is favourable, they will grow very fast, and as soon as the first flowers open they should be hand-pollinated to make some of fertilisation, though it is generally not necessary. At least two plants should be grown and they should be cross-pollinated as the fruits do not always set well with pollen from the same plant. When three fruits of the larger or six to eight of the smaller fruited varieties have set, all the later flowers should be picked off, and the main shoots and any subsequent laterals after the second leaf stopped.

The most useful and the best keeping variety of Pumpkin, which is grown universally in Australia and New Zealand, is the Ironbark. The Hundredweight is similar (and possibly the same under a different name). This can easily be grown to 40lbs. or 50lbs. in this country, allowing only one fruit to a plant, and feeding liberally. In Australia fruits are seen up to 120 lbs. But if three or four fruits are allowed to mature they will be 15 to 25 lbs. each, and these are more useful. Another good large variety is Large Tours or Mammoth French.

The best flavoured Pumpkin is one known as The Turban or Turk's Cap in New Zealand, but it probably has other names; the French Red Etampes is similar. This is also a handsome fruit, having a buff orange skin, with scarlet bosses on the top part. It is a medium sized Pumpkin, weighing from 15 lbs. to a maximum of about 60 lbs., but the plants take up less space, and more fruits per plant can be grown. It is said to be less hardy than the Ironbark, and I have not grown it here, but in New Zealand it grows quite well.

The best Squashes are the Mammoth White Bush, Early White Bush, and the Hulbard. They keep well, but are also good to eat in a young state like Vegetable Marrows.

The fruits of both Pumpkins and Squashes should be harvested when ripe, or as late as possible before frost comes, and the less ripe ones eaten first. They keep best in a dry, cool store protected from frost. *A. J. Bliss.*

POTATO CROPS

The information and statistics given by W. Cuthbertson (see p. 152) concerning the field cultivation of Potatoes in the Lothians shows the practice of giving them a space of 27 by 12 inches to be identical with that of the farmers 100 to 200 miles further north. His suggestion that second early and maincrop varieties should have a space of 3 feet by 12 to 14 rounds in that many Potatoes are sown is too large for the table, necessitating the cutting of the tubers before they can be holed out in conformity with others of more moderate size. Would not closer planting result in saving a small amount of produce from a given area, of tubers of moderate size. In dry seasons all the late Potatoes are greatly increased before frost sets in. A sowing of the tubers commences in the first of June, and there is a loss of ground to the potatoes. After July 1st, this starts to be sown with the year. I sowed three rows of a second early Potato with sturdy tubers for small gardens. Sturdy stems and the fact that they could stand up 20, and I can remember that they were a very crop in the autumn, and that between 10 and 12 inches on the stem and 12 inches in diameter, but also a small one.

It is a pity that the soil is not being about garden results. Where a small garden is surrounded by high walls, also boarded fences, lodges, or other buildings, which obstruct the light and exclude the beneficial action of air and wind, the Potatoes grow tall, fall down, and give but a few and small tubers. A great many of these is due to the poverty of the soil, and to the need to manure more or less heavily, which only ennobles the soil. Many gardens have a good ground for Potatoes by the application of farm and poultry manure until the soil is deep and overabundant with humus. The plants are prey to aphides and various other pests, and when the foliage decays, the Potatoes are dug up, and prove satisfactory and almost unobtainable. There is very little stock in them, and late varieties are worse than early ones. The best remedy for this state of matters is an allotment in an open situation. *J. F.*

The depth of cultivation and the distances for planting are purely matters of circumstance. I have just completed the planting of a seven-acre plot on the "Deans," where the soil has an average depth of 8 inches overlying chalk. To attempt to plough deeper would bring up too much chalk, which would not be an advantage. The rows are made 2 feet 6 inches apart, and the tubers set 15 inches asunder in the rows. On this plot the growth is never luxuriant, neither is the crop heavy, but the cooking quality of the tubers is quite satisfactory, and, as a rule, there is not much disease. This is the eighth successive year Potatoes have been planted on this site, always, until this year, with a change of seed, generally Scotch grown. Up to date, where the soil is deeper, richer, and the growth more luxuriant I advocate deep cultivation and ample space for the more vigorous growing sorts, especially in gardens where trenching is done, and where the soil is of a heavy, tenacious character. On many farms where the soil is stiff it is difficult to plough so deeply as one could wish owing to the presence of large flints, which are freely mixed with the subsoil. In light, bony soils there is no excuse for shallow cultivation, and an advantage

would certainly be gained by deeper ploughing. The manner in which the different varieties grow should govern the distances apart; dwarf growing sorts need not have so much space as those of greater vigour. *E. Mulhaur.*

BRUSSELS SPROUTS

In your interesting review of the recently published pamphlet by the R.H.S. on the cropping of allotments, you express surprise that Brussels Sprouts are discarded from the list of vegetables recommended. I have many times of late put the question to market growers of vegetables, "What is the most valuable of green winter vegetables?" and have invariably received the reply, "Brussels Sprouts." How any person with knowledge of the subject, or, I would say, knowledge of what constitutes a full crop, could argue that "they give only poor returns," I am at a loss to understand. Well-grown plants are ready to pick from early in October and continue in bearing until the middle of April, when the tops further yield much useful food. With the exception of various forms of Kale, no other green vegetables have stood the severe weather of the past four months so well as Brussels Sprouts.

Much complaint of this crop is due to want of appreciation of the fact that to cultivate Brussels Sprouts well a long season of growth is required. Too many persons are sowing the seed when they should be putting the plants out in their final quarters. If the plant has not time in which to make true growth, say, 5 feet to 4 feet high, how can a full crop of Sprouts be obtained?

The miserable plants so commonly seen are but an apology for the real thing, and the sooner those who complain of the uselessness of Brussels Sprouts take a lesson in what is truly representative of the plant the better for all concerned. *E. M.*

THE RELATIVE FOOD VALUES OF DIFFERENT CROPS.

MR. D. W. SIMMONS, writing on "The Relative Food Values of Different Vegetable Crops" (p. 125), states that much is being written that is true so far as it goes, but is not calculated on a stable basis. I agree and rely, for Mr. Simmons goes on to draw comparisons between Potatoes and Parsnips, based on figures very unfair in the latter and a bit flattering to the former. Thus, 8 tons per acre he considers a fair estimate of a crop of Parsnips. I have known many crops of Parsnips which amounted to at least 16 tons per acre. I have not so much experience of Potatoes, but such as I have make me think that 10 tons per acre would be a very fair estimate for the crop, not 12 tons. Mr. Simmons does not make any allowance for the difference in the cost of growing an acre of each of these crops, which is very considerable. On p. 155, under "Fruit Prospects," advice is given to "lose no time in mulching Strawberries." I was always told not to mulch Strawberries, Gooseberries, Currants, or kindred fruits early, but to wait until the fruit is set, and experience teaches me the wisdom of the admonition. The risk of damage by frost is increased exceedingly by mulching. *Wm. Poupert, Tunbridgeham.*

GLASGOW ALLOTMENTS

The Parks Committee of the City of Glasgow has now provided upwards of 4,000 allotments, and there is still a demand for more. The land is mainly acquired under the orders of the Board of Agriculture, and has principally been unoccupied. In order to meet the demand, a popular feature of the Tollcross Park is to be sacrificed by laying out the park occupied by the deer for allotments.

TOO MANY BOOKS.

COMPLAINTS are being received from all parts of the country on the damage done by books, especially to newly-sown corn. In moderate

numbers, it seems certain that rooks do good to the farmer by destroying wireworm and other pests of the soil. But in many districts the number has become excessive, and where that is the case steps should be taken to destroy them. Probably the best method of attack is to shoot the young rooks just before they are able to fly away from their breeding-place, some time about the middle of May. This system has two advantages—(1) it supplies the basis for rook-pie, which is an excellent form of food; (2) it leaves the rooks alone while the young birds are being fed by the parents, during which time the rooks chiefly eat insects. But this year cartidges are scarce, farmers are busy, and it is difficult to arrange a shoot just at the right time. Another method of reducing the numbers of rooks is either to destroy the nests, or to secure the birds off the nests some cold night after the eggs are laid and before they are hatched. The eggs become chilled and fail to hatch out. When scared from the nest, the birds will probably desert it, and move to another clump of trees. Hence it is desirable to arrange the searing method over a considerable area of the neighbourhood. If the owners of rookeries are unwilling to allow the birds to be molested, the help of the Secretary of the Executive Committee should be invoked. When the numbers of rooks are really excessive, it is important that prompt steps should be taken.

ENCOURAGE THE PLOVER

THE common green plover is a good friend to the farmer; it eats large numbers of wireworms, leatherjackets, snails, slugs, and many other injurious creatures. In view of this fact, the apathy displayed by agriculturists in regard to this valuable bird is astonishing. Every encouragement should be given to the birds to multiply, and the luxury of plovers' eggs should be foregone—in wartime, at any rate. The small addition to the food supply the eggs afford is dearly bought if it is considered how many grubs the resulting birds would have eaten. Farmers should, therefore, discourage the collection of plovers' eggs on their land. The birds will begin nesting very late this year owing to the cold weather, and should be given every chance of hatching out the first clutch of eggs that they lay.

ORCHID NOTES AND CLEANINGS.

HYBRID ORCHIDS.

(Continued from March 3, p. 153.)

Hybrid.	Parentage.	Exhibitor.
Brasso-Cattleya Lady Delfino	B.C. Dighiano-Schröderae × C. Gaskelliana albens	Armstrong and Brown.
Brasso-Laelio-Cattleya Diana	B.C. Mrs. J. Leeman × L.C. Domaniana	Stuart Low and Co.
Brasso-Laelio-Cattleya Harrisonia	L.C. Juno × E.O. Mrs. J. Leeman	Flory and Black.
Cattleya Esbery	Lord Rothschild's Schroderae	Duke of Marlborough.

Sophia-Laelio-Cattleya Nense	S. L. C. Marathon × L.C. callistoglossa	Charlesworth and Co.

PRESIDENT WILSON'S APPEAL TO AMERICAN GROWERS.

IN the course of his appeal to the American nation for their whole-hearted co-operation in the war, President Wilson addressed the following words to farmers and all producers of food:—

"The supreme need of our own nation and of the nations with whom we are co-operating is an abundance of supplies, especially food-stuffs. The importance of an adequate food supply, especially in the present year, is superlative. Without abundant food, alike for the armies and peoples now at war, the whole great enterprise upon which we have embarked would break down and fail. The world's food reserves are low. Not only during the present emergency, but for some time after peace shall have come, both our own people and a large proportion of the people of Europe must rely on the harvests of America. Upon the farmers of this country, therefore, in a large measure rests the fate of the war, the fate of nations. May the nation not count upon them to omit no step that will increase the production of their land or bring about the most effectual co-operation in the sale and distribution of their products? The time is short, and it is of the most imperative importance that everything possible be done, and done immediately, to make sure of large harvests. I call upon young men and old alike, and upon able-bodied boys, on the land to a cept and act upon this duty."

"I particularly appeal to farmers in the South to plant abundant food-stuffs as well as cotton. They can show their patriotism in no better and more convincing way than by resisting the great temptation of the present price of cotton, and by helping upon a great scale to feed the nation and peoples everywhere who are fighting for their liberties and our own. The variety of their crops will be a visible measure of their comprehension of their national duty. The Government of the United States and the Governments of several States stand ready to co-operate. They will do everything possible to assist farmers in securing an adequate supply of seed, an adequate force of labourers when they are most needed at harvest time, and means for expediting the shipments of fertilisers and farm machinery, as well as the crops themselves when they are harvested. The course of trade shall be as unhampered as it is possible to make it, and there shall be no unwarranted manipulation of the nation's food supply by those who handle it on its way to the consumer. This is our opportunity to demonstrate the efficiency of a great democracy, and we shall not fall short in this."

THE KITCHEN GARDEN.

By J. DENN, Foreman, Royal Gardens, Windsor.

SEED-SOWING.—Make the principal sowing of autumn and winter Broccolis, Borecole, Hardy Cabbage, and Savoy during the next few days on ground fully exposed and not too rich. Sow the seeds in shallow drills made 1 foot apart. The bed should be tilled to prevent small birds from destroying the crop. Veitch's Self-protecting Broccoli is indispensable. For furnishing supplies in autumn and early winter Early Market, Early Feltham, and Snowdrop will continue the succession. St. Patrick's Day, Main Crop, April Queen, Mid Feltham, Model and Victory are sown at Windsor, and seldom fail to produce regular supplies until the earliest Cauliflower are ready to cut. Plants from a sowing of Halloween Giant Cauliflower made now will produce heads throughout October and November. This Cauliflower is not likely to be injured by early frosts. Christmas Drumhead Cabbage, Copenhagen Market Cabbage, and Savoys should be sown in quantity about the end of April.

CHICORY.—Sow seed of Chicory now and again a fortnight later in drills made 18 inches apart. Thin the plants to 9 inches in the rows as soon as they are large enough to handle. Slugs must be kept in check by dusting soil or lime along the rows in the early mornings whilst the foliage is damp.

CARROTS. A good breadth of Carrots should be sown as soon as the soil is in a suitable condition, choosing such varieties as Monument, Model, and Intermediate. The seedlings should be thinned as soon as they are of sufficient size. Dust soil along the rows on frequent occasions, and stir the soil lightly with the Dutch hoe as often as circumstances permit. Further sowings of stump rooted Carrots may be made up to the middle of July, selecting a sheltered situation for the latest sowings, the plants from which may remain in the ground throughout the winter. It is from these late sowings that Carrots are being supplied at Windsor now.

AUTUMN-SOWN ONIONS. The plants should be lifted carefully from the seed rows and transplanted in rich soil. Onions will be a valuable crop throughout the coming summer and autumn, and these autumn-sown plants will be of great service, as the crop sown in the open during March is almost certain to be late. After the seedlings have been thinned and transplanted, make the plants that still remain firm in the ground as soon as the soil is dry enough. Keep the bed free from weeds, and give occasional dustings of soot and artificial manure during the growing season. Onions raised in boxes this spring should be ready for transplanting, and the work should be done as soon as the weather is favourable. Lift the plants carefully with a trowel, and plant them in rows made 18 inches apart, making the soil firm around the bulb with the hand. Protection from rough winds may be necessary until the plants become re-established. Later, the Dutch hoe should be lightly worked between the rows to keep the soil free from weeds.

ENDIVE.—Plants of the latest batch of Endive which has been wintered in cold pits should be kept quite cool. Ventilate the frame twice by night and day, and shade the plants during bright sunshine. Cover the lights with some thin material ten days before the plants are required for salad. Make another sowing of Endive as soon as possible in rich soil, which is necessary to obtain a quick growth.

LETUCE.—Plants of Lettuce raised in February, and transplanted in heated pits, are making good progress. Stir the soil frequently

between the plants, and give a liberal supply of clear, soft water at the roots. The pit should be closed early in the afternoons to promote a quick growth. If slugs are troublesome use lime around the walls of the pit or lightly dust it over the crop. Lettuce may now be sown in the open. Sow the seeds thinly, and thin them as soon as they are large enough, leaving the plants in the seed rows 9 inches apart. Make further small sowings every three weeks throughout the season, and thin the seedlings before they become drawn. Monument is a splendid Cabbage Lettuce for summer use, and will stand a long time without running to seed.

FRUITS UNDER GLASS.

By JAS. HIRSON, Gardener to Mr. LEOPOLD DE ROTHSCHILD, C.V.O., Gunnerbury House, Acton, W.

MELONS.—With the advance of spring Melons should be showing more vigorous growth, and those who have not attempted to force their plants unduly will now reap the reward of their patience, for the increased power of the sun's rays will greatly favour the crop. In American gardens Melons are grown even in winter when frosts are intense, but the secret of success in that country is the relatively greater amount of sunshine. The earliest fruits will be set by now in many gardens, or on the point of setting. From now onwards keep the growth thinly disposed, and concentrate all the energies of the plant on the development of the fruits. When the Melons are seen to be swelling tend the roots with a little weak manure water. Guard against a dry, cold atmosphere by damping the bare spaces on frequent occasions, and keeping the evaporating troughs filled with water. Sprinkle the plants freely if there are any indications of red spider. Look to the successive crops, and sow more seed to keep up the supply of fruits according to the demand.

MELONS IN FRAMES.—One of the best methods of obtaining Melons of high first quality is to grow them in frames, but not so much fermenting material will be needed in pits as in frames, hence there is an economy in the use of pits, with possibly some and from water pipes. The seed should be sown without delay, whether for frame or pit culture. It will be easy to obtain sturdy plants now, but do not allow the growth to be checked before they are planted out. Seeds of Cantaloupe Melons should be sown, and the frame prepared for the plants for Cantaloupes in a second condition is suitable. Paris Favourite is one of the best varieties. Spare frames may be ready by the middle of May, and one barrow load of sweet fermenting material will be ample for placing under each mound of soil on which to set a single plant. Make the dung firm, also the loam, before planting is done. Half-hardy Melons may be grown in the same way as Cantaloupes. There is an advantage in cultivating the Melon in this way at the present time in the saving of labour and sparing the plant houses for other fruit crops.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to St. JERMAIN CONWAY, Bart., Garden Park, Basingstoke.

DENDROBIUM.—The spring-flowering Dendrobiums are passing out of flower, and many are developing roots from the bases of the new shoots. Well-established plants growing in good material and with sufficient room in the receptacle for the present season's growth only require top-dressing, first picking away some of the old compost from between the surface roots and replacing it with fresh material. Others with compost loose and sour should be re-potted. Turn the plants out of their pots, remove the old potting material and all decayed portions of the roots and useless pseudo-bulbs, leaving only two or three pseudo-bulbs behind each leading shoot. Ordinary flower pots or fairly deep pans are the most suitable receptacles in which to grow these Dendrobiums, and they should be only large enough to just accommodate the roots. Fill the pots to about one-fourth of their depth with clean crocks, placing a layer of short por-

tions of Fern rhizome over the top in order to ensure perfect drainage. The rooting medium may consist of either Osunda fibre or A I fibre and Sphagnum moss in equal proportions; the fibre should be cut into rather short pieces, and all the fine particles removed. Add sufficient crushed crocks to keep the compost porous. In re-potting, work the compost well between the roots and press it moderately firm, keeping the base of the plant just below the rim of the receptacle. The surface of the soil may be covered with a layer of chopped Sphagnum moss at once, or later when the new roots have grown freely, the latter being the better plan. Tie the pseudo-bulbs to stakes to keep the plant secure in the pots, as plants that are not firm in the soil rarely become well established. Water newly-potted plants with extreme care, as there is a danger of both the young roots and growths damping off if too much moisture is applied during this early stage. Whilst growing freely, let the plants have plenty of sunlight, short of scorching the foliage. In hot weather light sprayings overhead each afternoon will be beneficial. The old pseudo-bulbs that have been removed may be prepared if an increase of the stock is desired, selecting those with dormant eyes that have not produced flowers. Each pseudo-bulb should be labelled and placed on a stage in a warm house for a week or two before inserting it. In preparing the pseudo-bulbs for rooting, cut them to a single eye at a point that has not produced a flower. Cut close to the eye at the top end, leaving rather more of the stem at the bottom to insert in the compost, and the portion of stem will also help to sustain the young shoot. The cuttings may be placed in 4-inch pots, half-filled with crocks for drainage, putting a layer of Sphagnum moss over the crocks and filling to the rim with a mixture of leaf-mould, Sphagnum moss, and coarse silver sand. Insert the cuttings firmly in an upright position, taking care not to cover the dormant eye. They may be rooted in a warm propagating frame, that should be slightly ventilated each night, but closed during the daytime. Keep the rooting material on the dry side, and spray the plants lightly on bright days. When the young growths are about an inch long, shift the plants into small pots, using similar compost to that for established plants.

THE FLOWER GARDEN.

By W. J. COOK, Gardener to Mr. TEMPLETON, Kent, and HALL, Staffs.

PLANTING VIOLETS.—Directly the weather is favourable Violets that are propagated in frames should be transferred to rich, well-cultivated ground in the open. In a shady position the plants will not be so liable to attacks of red spider as when planted on hot, sunny borders, where it is practically impossible to keep this pest in check. Detach the strongest side shoots from the old plants, with a few roots whenever possible. A space of 12 inches should be allowed each way between the plants, to permit of a free use of the hoe, and allow for stringings, and occasional dustings of soot. The method we adopt at Kettle is to score the beds out with a trowel, place two or three crowns together, and cover the roots with light, sandy compost. The plants are syringed on bright days. Care must be taken not to injure the foliage, or the plants may never get a check to growth. The following are good double varieties: Countess de Brazza, white; Mrs. P. Argy, variegated; Mrs. J. F. Astor, bicolorous; and Lady Home Campbell. Good singles include Princess of Wales, probably the finest single Violet in cultivation; La France, Baroness de Rothschild, and A-Kama.

ORNAMENTAL GRASSES.—Annual and perennial grasses are useful plants for matted borders, and for the margins of streams, and forming large clumps on lawns. If the graceful, feathery panicles are cut in the autumn and carefully dried they will be found useful for decorative purposes. The stems of *Arrostis nebulosa* and *P. pulchella* are suitable for arranging with cut flowers. Seed of annual grasses may be sown now. *Eragrostis elegantis*, *Lagurus ovatus*, *Herdum jubatum*, and *Ochloa elegantis* are all ornamental species. The taller-growing *Erian-*

thus, *Eulalia japonica*, *Polypogon*, and *Elymus canadensis* are also very attractive.

THE ROCK GARDEN.—Should any difficulty be experienced in replacing failures amongst Alpines the vacancies may be filled by Violets and such annuals as *Portulaca*, *Calendula*, *Tagetes*, *Ageratum*, *Godetia*, *Gypsophila muralis*, *Candytuft*, *Nemophila* and *Eschscholzia*.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NOTTINGHAM, Eastwood Park, Kent.

SOUVENIR DE LA MALMAISON CARNATIONS.—Plants of "Malmaison" Carnations which have been kept practically dormant during the winter are commencing to grow freely. Give the plants occasional top-dressings with Carnation manure, and use a little diluted soot water at frequent intervals. More water will be required than hitherto, but on no account keep the soil saturated, or the plants will become unhealthy. Plenty of ventilation should be afforded whenever the weather is favourable. Plants grown in these conditions invariably produce the finest of flowers, the colour being much deeper, and the blooms of greater firmness and solidity, than when the plants are forced into bloom early. Tie the flower spikes neatly to stakes as they lengthen. If first class blooms are required, all flower buds, except the terminal one, should be removed as soon as they develop. The variety Princess of Wales is still very popular with growers. Other excellent varieties in various shades are Princess May, Mme. Patti, Lady Coventry, Duchess of Westminister, Maggie Hodgson, and Lady Naiman Solome. The last named is a deep apricot colour, and the blooms possess splendid lasting qualities.

PERPETUAL-FLOWERING CARNATIONS.—Shift young plants of Perpetual-flowering Carnations into larger pots as soon as the roots have reached the sides of the small pots, for if they are allowed to become pot bound a check will result, the shoots will become hard, and very slow in starting into growth. Return the plants to a light house, and keep this structure a little warmer than hitherto until the plants commence growing again, when plenty of air should be given. Pinch out the points of the shoots to induce the plants to break freely. A collection of the best varieties includes Champion, Pink Sensation, Aviator, Gollon, Triumph, Carola, Scarlet Carola, Grace, Gorgons, Mary Allwood, May Day, R. F. Felton, Salmon Embroidress, and Baroness de Brionne.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. F. DAVESY, Abbeys Wood, Godalming, Surrey.

FRUIT BLOSSOM.—All fruit trees are very late in blooming, but Peaches and Nectarines are on the point of expanding their flowers, and measures should be taken to protect them from frost, although, being so late in the season, there will be less danger than usual. Perhaps the greatest evil to be feared now are cold winds. Showery weather is the best for fruit setting, with intervals of bright sunshine. I have not noticed either a bee or a fly in our late Peach house, but have sprayed the trees every day while they were in flower, and have never had such a fine set. Keeping the trees on the moist side also prevents aphids from spreading.

CROPS ON FRUIT TREE BORDERS.—Vegetables should not be planted within 2 feet of wall trees, as this room is needed for operations to keep the trees healthy. Moreover, the surface roots of the trees must not be disturbed by digging the ground for the vegetables. Inferior wall trees are often the result of impoverishing the border with roots of other crops.

ALPINE STRAWBERRIES. The back or borders of white Alpine Strawberries are planted should receive attention. If the roots have been lifted by action of the weather, they should be pressed firm in the soil again. At the same time, add a good top-dressing of old potting soil, which will favour a rapid recovery from injury caused by the frosts.

EDITORIAL NOTICE.

Editors and Publisher.—Our correspondents would oblige by delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the EDITORS, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication. as well as specimens of plants for naming, should be addressed to the EDITORS, 41 Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the paper, sent us early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, APRIL 24.

ROY. HORT. SOC.'S COM. MEET., Nat. Amateurs and Promoters Soc. (Southern Section) Show with R.H.S.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 48.6

ACTUAL TEMPERATURES—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thursday*, April 19 (10 a.m.): Bar, 30.0; temp., 55.0; Weather (Showers).

SALES FOR THE ENSUING WEEK.

TUESDAY, WEDNESDAY AND THURSDAY.

Sale of the collection of orchids formed by the late W. Thompson, Esq., at Walton Grange, Stone, Staffs., by Protheroe and Morris, at 11.30 each day.

WEDNESDAY—

Roses, Rhododendrons, Carnations, Gladioli, Lilies, &c., at 67.50, Cheap-side, at 12 o'clock, by Protheroe and Morris.

It is to be hoped that the present difficulties which beset those to whom we look for providing year by year the seeds for our gardens may not only be overcome, but may also be turned to the permanent advantage of the British Empire.

Among these difficulties are, first, the lack of transport, and second, the lack of labour.

As is well known, the shortage of transport and the activity of the submarines are seriously restricting the free exchange of commodities. Both export and import are interfered with. Pedigree stock seeds raised in this country and ordinarily sent abroad to better seed-raising districts for producing seed in large quantities are often held up, and as a consequence the supplies which should be returned to this country are not forthcoming. It might be argued that this is not altogether a disadvantage, inasmuch as it should lead to a large increase of seed-raising in this country. But, unfortunately, this happy solution is by no means always practicable, and this for two reasons. In the first place, there are important vegetables—and also flowers which fail to ripen their seeds well

in this country. This, we believe, is the case with Cauliflower, Carrot and Onion, and among flowers Plox and Aster. In the second place, with the existing lack of labour many seed farmers who were in the habit of accepting contracts for seed raising are less disposed than in normal times to enter into contracts. It is probable also that with the higher prospective prices for purely agricultural crops, farmers are finding, on balancing probable profits and amount of labour available, that it is more profitable for them to grow corn than to raise vegetable crops for seed. The urgent need for increasing the Wheat supply is, moreover, causing agriculturists generally to look with disfavour on the farmer who gives up part of his land to growing minor crops. The fact that this prejudice is due to shortsightedness does not mitigate the seriousness of its effect. Hence from a multiplicity of causes the outlook of the seed industry is by no means too cheerful. Yet by a strange irony the present time offers an opportunity for the drastic revision of our customs with respect to seed-raising. In the past a large section of this trade has been allowed to pass into German hands. With their customary thoroughness, the Germans had made something like a monopoly of the seed trade in some parts of the world. Of the seed they sold, some was of their own growing, but much was raised by other countries and purchased and sold again by the Germans. There would seem to be no reason why much of this trade should not pass permanently into the hands of British firms. It is true, as we have said, that not all seeds can be raised successfully on a large scale in this country; but, on the other hand, many of the seeds of vegetables and flowers might quite easily be raised here. In any case, the Empire, which comprises every soil and every climate, gives ample ground for the raising of all the seeds of every kind of vegetable and flower which we require. Why, therefore, should not the great firms of British seedsmen seek the co-operation of the Government and endeavour to arrange a system of seed-raising within the Empire which should free them and ourselves for the future of the risk of finding our supplies cut off or curtailed in time of war?

At present the working up of pedigree stocks raised with infinite pains in this country—is by no means always satisfactory. Those stocks sent to another country may or may not be properly attended to, even though the senders themselves despatch skilled men to supervise the rearing. As a result, the seed derived from these stocks is not always as "true" as it should be, and that through no fault of our seed trade. Specialised seed-growing stations within the Empire, properly staffed, and co-operating with the great seed firms to secure the production and multiplication of the best seeds, would be of the greatest benefit to British horticulture, and should be of no less benefit to the seed industry. The loss of

crop from the growing of inferior or untrue varieties is often great, and that loss is almost entirely avoidable. In a better organised Empire the limitations of what can be achieved by the individual and what must depend on collective action will be recognised. If this recognition were to be applied to the seed industry it would result in the further specialisation of that already complex business. It would put the resources of British science at the disposal of the seedsmen engaged in improving the strains of plants, and it would make provision for the raising of the best strains in the most suitable climates.

R.H.S. WAR HORTICULTURAL RELIEF FUND.

An orchestral concert will be held at Queen's Hall, Langham Place, on Saturday, the 20th inst., at 3.15 p.m., in aid of the R.H.S. War Horticultural Relief Fund. The programme is to be rendered by the Stradling Players Amateur Orchestral Society. The concert has the patronage of H.R.H. the Duke of Connaught, K.G., and other distinguished personalities.

ACID PHOSPHATE FOR ROSES.—Tests made on the comparative flower-producing virtues of acid phosphate (20 lb. per 100 cubic feet of soil) and bone meal of a corresponding value lead to the conclusion that the former artificial manure is the better flower-producer. It is claimed that on the average the plants treated with this manure produce 2½ flowers more than those treated with bone meal.

CROPPING IN BROKEN-UP PASTURE.—An interesting account by Mr. C. HURSTONSON of the cropping of land which had been under grass (poor pasture) since the early nineties shows both the seriousness of the damage due to wire-worm, and also the effects of cultivation in averting the pest. The pasture was steam-ploughed in September, 1915. A Potato crop taken in the following year on part of the area, although attacked by wire-worm, yielded 6 tons to the acre. In the case of Wheat, it appeared from the results of 1914 that shallower ploughing might be beneficial in keeping down wire-worm, and the Wheat crop in the following year appeared to confirm this observation. Potatoes in 1915 were attacked as severely by wire-worm as in the previous year, but in 1916 the attack was only slight. Nor was the Wheat which followed the Potato crop attacked. The results of the experiment also indicate that after grass land has been turned up Oats are a safer first crop than Wheat.

MR. DAVID INGLIS.—MR. DAVID INGLIS, who succeeded the late MR. DAVID THOMSON as gardener to the Duke of Buccleuch at Drumlaigrig Castle, Thornhill, Dumfriesshire, is retiring at Whiteside. Mr. INGLIS will be succeeded by MR. ROBERT STUART, formerly gardener to the Right Hon. Viscount Maitland, at Thirlstane Castle, Lauder, Berwickshire, and recently engaged in the Parks Department, Glasgow. Mr. INGLIS will reside in future at Thornhill.

BRITISH PINE SEEDS FOR FRANCE.—In order to assist in re-establishing the forests of France so severely devastated during the war, the Agricultural Relief of Allies Committee, with the co-operation of the Royal English Arboreal Society, are this week sending a quantity of seeds of Scotch Pine to Dieppe. Nearly 1,000 lbs. of the seed have been obtained from British forests, and will be given to the peasants and small proprietors who in France own a considerable area of forest land. Free facilities for the conveyance of the seed

* "An Experience in the Breaking-up and Cropping of Old Pastures," *Journ. of the Board of Agric.*, March, 1917.

have been provided by the British War Office. The gift has been greatly appreciated by the French Government, and the mature tree will form a permanent memorial near the battle-field of the loss of Amos and sympathy, not only of the British and French troops, but of the farmers and arboriculturists of the two nations.

FRUIT AND THE FOOD SUPPLY.—In an address to the Fellows of the Royal Horticultural

waste domestic products such as bones, fur, wool waste, leathers, and calcium carbide residue was emphasised. The lecturer advised landowners to plant experimental plots in districts where fruit is not generally grown.

THE CULTIVATION OF WASTE LAND AFTER THE WAR.—It is the opinion of many that the cultivation of allotments on waste land should continue after the war until such time as the owners need the sites for building and other

Federation having been notified through the Wood Green District Council that the Prime Minister says: "It is not practicable to guarantee the occupation of vacant land as allotments for more than one year," expresses its dissatisfaction with this answer, and respectfully suggests to the Prime Minister the desirability of reconsidering his decision on this question; (2) That the Government be asked to introduce a Bill giving security of tenure to allot-

tural Society on the 11th inst. on "Increasing the Home Fruit Supply." Mr. E. A. BESAYED called attention to the need of more careful selection of varieties to cover as long a season as possible, and to the possibility of storing late Apples and Pears in boxes, wrapping each fruit in paper. He stated that the hardy fruits will keep perfectly, and if frozen in an outside shed no harm results if the fruits are allowed to thaw slowly. The manurial value of many

legitimate purposes. Such persons argue that much labour and expense in tilling and manuring will be wasted if the ground is permitted to fall into a derelict condition again after the cessation of hostilities, and that the retention of the plots by the growers would be for the public good. The Wood Green Allotments Federation gives voice to this opinion in the following resolutions passed at a meeting of this Society held on March 31 last: (1) This

ment holders of unoccupied lands subject to the payment of a moderate rent, say, of 6d. per pole, the holdings being retained so long as the land is not required for building purposes.

A MAMMOTH POTATO. The month of many a quoniam would water at the sight of the Potato, an illustration of a tuber raised, appropriately enough, at Eureka, in California.

Fourteen inches long, the tuber of the variety Dutch Red weighed 4½ lb. Another of 16 inches was cut into six pieces and baked, and six people failed to consume it all, although its quality was said to have been excellent.

CRAIGENDOWIE TRAINING SCHOOL FOR WOMEN.—Good work in the way of training women for agriculture is being done at Craighendowie, Broughton, near Preston. The owners of the place, Mr. and Mrs. RITCHINGS, have laid out seventeen acres of the estate as a market garden, and here they train six students at a time for two months in various kinds of agricultural work. At the end of each period of two months, the trained students are sent to situations, and fresh recruits take their places.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

LAWNS AND THE FOOD PROBLEM.—Instead of destroying lawns, I propose that Runner Beans be grown as follows:—Cut out pieces of the turf about 1 foot square and 3 inches thick all over the lawn, leaving, say, 2 feet of space between the holes so cut. In a lawn 27 feet each way, we should thus obtain eight rows of eight holes each, or sixty-four holes with turf between them and turf round the margin of the plantation. The soil in the holes need not be removed, but should be loosened up. The sixty-four turfs can be stacked in any spare part of the garden to be put back next November. The Runner Bean I suggest growing is that known as "White Dutch." It is one of those Beans that can be used as a "Haricot" or "Batter Bean." It is very nutritious as a winter food, a good cropper, and does well in this country. Most of this class of Bean are grown in Italy, and do not do well with us. I have eaten the "White Dutch" Bean, and consider it of even better flavour than the Italian grown varieties. To return to our plantation: In May or early June plant four of the Beans

conclusion that humogen supplied for the Wisley experiments was not standardised, asks what is the criterion for standardisation. There are two criteria by which a manure may be judged: (1) By direct measurement, where chemical analysis shows within narrow limits of error the quantities of its constituents, but which often fails as an infallible criterion because the methods of estimating "available" as against "unavailable" constituents are, in our present state of knowledge, necessarily empirical, and for other reasons; and (2) by indirect measurement, where the results of its application to a crop in a given set of conditions are measured. The experimental error in such attempts at indirect measurement are often large, but where care is exercised to reduce this error to relatively small dimensions, the latter is the more reliable. It should be remembered that there are many difficulties to be overcome in devising experiments in gardens which are peculiar to the conditions existing there, and these difficulties call for special measures in order to reduce the experimental error. The object of the Wisley experiments with humogen was to ascertain in the first place whether the material would give the results claimed for it. In Series I, it indeed greatly accelerated growth; in the following five series no marked benefit was derived. If the quality of the material had been the same in every case, i.e., if it were of standard quality, the results obtained should have been of the same order all through. They were not, therefore, judged by the second criterion; the material was not standardised. Published results from other sources confirm this view, and some of them show that the quantity of nitrogen present in the different samples analysed varied within wide limits, so that the judgment by the first criterion also, the substance was not standardised. It is impossible here to enter fully into the question as to what the occasional (and at first frequent) good results were due. It must suffice that there was nothing in the appearance or manner of growth of the plants in Series I, at Wisley repugnant to the idea that the active agent in the humogen was nothing more mysterious than available nitrogen. I have already pointed out the probable cause of its fall from its original standard. Though the figures Dr. Durlam gives of his Potato experiments are insufficient to enable one to judge of the probable degree of the experimental error in the results he obtained, his statement that "actual rows are contrasted, controls being placed proximally to the trial rows," suggests that one row of treated Potatoes was compared with one of untreated. We are not told how many plants constituted a row, but the results of weighings made at Wisley (which I quote below) show that where the average weight of the plants in a row of twenty Potatoes is compared with that of the adjoining rows of the same variety, receiving in all things equal cultural treatment, and with equal exposure, the differences may be as great as those disclosed by his figures where humogen and no-humogen additions are contrasted.

AVERAGE WEIGHT OF CROPS FROM 20 PLANTS IN EACH ROW

	Row 1. lb.	Row 2. lb.	Row 3. lb.
Affan Chief	5.90	5.51	5.70
Balmoral Castle	5.95	4.15	5.42
Great Scot	5.15	2.19	2.60
Stirling Castle	2.52	3.15	2.75
Windsor Castle	2.02	2.61	2.77

These figures merely illustrate the need for duplication, at least in garden experiments.
F. J. Chittenden.

SAXIFRAGA GLORIA.—At the meeting of the Royal Horticultural Society on March 27 last Saxifraga Buseriana Gloria was awarded a First-class Certificate by the Floral Committee, which fact is omitted from your report of the meeting on page 157. As many depend upon your journal for the list of plants to which First-class Certificates and Awards of Merit have been made I draw attention to the matter. W. T.

WHITE WOOD STRAWBERRY.—May I be allowed to express my thanks to Mr. E. A. Bunyard for his kindness in presenting me with plants of the White Wood Strawberry so praised by Jane Austen. A. N.

FIG. 57.—*CAMPANULA SPECIOSA*. FLOWERS LIGHT PURPLE.

CAMPANULA SPECIOSA.

The illustration on fig. 57 shows a group of the rare Pyrenean *Campanula* growing in the rock garden at Kew. The plant belongs to the same section of the genus as the better-known species, *C. alpina*, *C. barbata*, and *C. albanica*, with the habit of the last named in spreading by means of underground stolons. Growing from 6 inches to 1 foot high, the stems are stout, and branch from the base upward, with large flowers borne singly on rather long stalks. The blooms vary in colour from light to dark purple, and are produced during the month of June. The long, narrow leaves, as well as the stems, are covered with hairs. This species is only found in the Pyrenees, growing in high limestone cliffs and rocky places among debris, in which the roots wander about in the loose, stony soil, sending up rosettes of leaves here and there. A plant of this name is illustrated in *Bot. Mag.*, tab. 2639, but this is now considered to be a variety of *C. glomerata*. Moist conditions will suit this plant, which seeds freely, and is easily raised from seeds. W. J.

in each of the squares and put a stick to each Bean. For sake of economy one stick and one to each square can be made to do, instead of four sticks to the square. As soon as the Beans begin to run, feed them with weak manure water. When they begin to bloom and set, increase the feeding judiciously, and so through the summer. By careful pinching of the leaders, "pickings" may be taken of green summer beans, and yet many left to ripen and dry for winter use. I have made a careful under-estimate, based upon long experience, and have found that even allowing for green gathering in moderation, 1 lb. of seed should yield 40 lbs. of Beans to be dried for winter use! This is worth doing, but with intensive and careful feeding even greater results may be obtained. In November, when the crop is gathered in, the sticks are put away, the turfs are replaced, the lawn cut with a scythe and well rolled. It is surprising how soon it is as good a lawn as ever. A plantation like this could be made very pretty as well as useful, looking something like a little hop garden, and what is best of all, a good and valuable food crop may be grown on a small lawn without destroying it. Edward Lovett, Craydon.

EXPERIMENTS WITH HUMOGEN (pp. 115, 157, 146).—Dr. Durlam, in commenting on my

MARKETS.

COVENT GARDEN, April 18.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of the trial of the principal saler...

Plants in Pots, &c.—Average Wholesale Prices.

Table listing plants in pots and their prices. Includes items like Aralia Sieboldii, Asparagus plumosus, Aspidistra, Cacti, Cerebra, Cocos Weddelliana, Cyclamen, Daffodils, Ferns, and various thymus.

REMARKS.—Good plants of white, blue and pink Helianthus, and a few Roses in pots are now offered. No movement in the warbler will bring an increased demand for flowering plants.

Cut Flowers, &c. Average Wholesale Prices.

Table listing cut flowers and their prices. Includes items like Anemone, Arums, Azalea, Camellias, Carnations, Daffodils, Heather, Lillium longiflorum, Narcissus, and various roses.

French Flowers, &c.—Average Wholesale Prices.

Table listing French flowers and their prices. Includes items like Allium, Anemone, Asparagus, Aspidistra, Cerebra, Cocos, Cyclamen, Daffodils, Ferns, and various thymus.

REMARKS.—Lilium longiflorum is lower in price than for some considerable time past. A good number of Roses are now on the market, and the blooms are exceptionally fine. The best-selling varieties are Mine...

Vegetables: Average Wholesale Prices

Table listing vegetables and their prices. Includes items like Artichokes, Asparagus, Beans, Broccoli, Broad Beans, Brussels Sprouts, Cauliflowers, Celery, Chicory, Cucumbers, Endive, Greens, Herbs, and various potatoes.

Fruit: Average Wholesale Prices.

Table listing fruits and their prices. Includes items like Almonds, Apples, Bananas, Dates, Grapes, and various nuts and berries.

REMARKS.—Supplies of Apples are very limited but a consignment of the early fruit available is expected to arrive next week. Early now obtainable...

There are few gardeners, and still fewer amateurs, who do not on occasion require immediate information upon various points of practice. But either from an unwillingness to inquire, or from not knowing whom to make the inquiry, they too often fail to obtain the information they are in want of.

CORRECTION.—In the list of decorative Roses, p. 156, for climbing variety of Mrs. W. J. Grant read climbing variety.

DESTROYING TREE ROOTS: AERIS. A method of destroying tree roots by means of blasting was described in the issue for February 24 last, p. 92.

NAMES OF PLANTS: G. H. B. I. QUERCUS THURETI? 2. Juniperus communis var. fastigiata; 3. Phytolmia serotinata.

PANTOCRITUM AND GARDENIA UNHEALTHY: F. H. Hughes. Bulb mites are present on the Pantocratum bulb. Remove the outside scales and burn them; then wash the bulbs with liver of sulphur, 1 oz. to 1 gallon of water.

PLANTS IN TUBS: Limicola. From your description of the plants with long, green leaves and bunches of blue flowers on a long stem, we suspect them to be Agapanthus umbellatus. Keep them in the stable until about the middle of May, when they should be played out-of-doors and watered freely.

PRUNING ENGLISH YEW AND HYBRID RHODODENDRONS: J. H. It is not too late to cut back the Yews, as the best time to do this work is just as the trees are starting into growth, which this year is later than usual. The Yew will break away again readily from the old wood, but we should advise you to give your plants a good top-dressing of manure when they commence to grow, as the Yew is a gross feeder, and well repays for a little assistance at the right time.

RHODODENDRONS TURNING YELLOW: J. B. The unhealthy condition of the foliage is not due to fungous disease or insect pests. The cultural treatment has been at fault, but without knowing how the plants have been managed we cannot say in what direction.

SOIL FOR CUCUMBERS: Limicola. The compost should consist of rich, fibrous loam mixed with well-rotted manure, wood ash, and a sprinkling of fertiliser. If the soil is deficient in fibre add a quantity of well-rotted leaf-mould.

ENQUIRY.

ORNAMENTAL VEGETABLES

It is well known that certain vegetables, such as Beet, Parsley, and Runner Beans, add to their culinary qualities an appearance during growth that is decidedly ornamental. In many gardens there are large beds that are usually devoted to flowers which this season could perhaps be made quite attractive with selected vegetables. I write in the hope that an idea of this kind has already received attention from some of our leading gardeners, in which case I am sure many readers would thank them for any details they can give us of approved schemes of planting.

SELECT LIST OF BOOKS ON GARDENING

To be obtained at the "GARDENERS' CHRONICLE" OFFICE from the Librarian.

Prices Quoted are in all Cases Post Free to any part of the United Kingdom.

- Alpine Flora:** for Tourists and Amateur Botanists. By Dr. Julius Hoffmann. Translated by E. S. Barton (Mrs. A. Gepp). 7s. 11d.
- Alpine Flowers for Gardens.** By W. Robinson. Revised Edition. With Illustrations. 1s.
- Alpine Plants, Dictionary of** (see "The English Rock Garden," by Reginald Farrer).
- Alpine Plants of Europe.** By H. Stuart Thompson. With Cultural Notes. Price 7s. 10d.
- Alpine Plants, Sub.** By H. Stuart Thompson. Including Coloured Plates by G. Flemwell. Price 6s. 6d.
- Annals, Hardy and Half Hardy.** By Charles H. Curtis. Contains 3 Coloured Plates. 1s. 10d.
- Apples and Pears.** By George Bonyard, V.M.H. With 3 Coloured Plates. 1s. 10d.
- Asparagus, The Book of.** By Chas. Hott. With sections on Celery, Salsify, Scorzoneria, and Sea-kale. Illustrated. 2s. 10d.
- Bacteriology, Agricultural.** By J. Percival, M.A. 7s. 11d.
- Banana, The: Its Cultivation, Distribution, and Commercial Uses.** By W. Fawcett. With Preface by Sir Daniel Morris. 7s. 11d.
- Bee Keeping, Book of.** A Practical Manual on the Proper Management of Bees, especially written for Beginners. By W. B. Webster. Illustrated. 1s. 5d.
- Bees, for Pleasure and Profit.** By G. Gordon Sauson. With chapter on "Bee-keeping in Hot Climates." Illustrated. 1s. 2d.
- Botanic Terms, Glossary of.** By B. D. Jackson. 7s. 11d.
- Botanical Names, Dictionary of, and their English Equivalents.** By G. F. Zimmer. 2s. 9d.
- Botanist, The Young.** By W. Percival Weston and C. S. Cooper. Excellent for young people commencing to botanise. 3s. 10d.
- Botany, Agricultural.** By J. Percival, M.A. 7s. 11d.
- Botany, A Practical Introduction to the Study of (Flowering Plants).** By J. Bredland Farmer, F.R.S. 121 Illustrations. 2s. 10d.
- Botany, A Primer of.** By Sir J. D. Hooker, F.R.S. 1s. 3d.
- Botany, A Text-book of.** By Dr. E. Strasburger. Translated by H. C. Porter, Ph.D. Revised. Fifth Edition. 779 Illustrations. 2s. 6d.
- Botany, A Year's.** Adapted to Home and School Use. By Frances A. Kitchener. With 195 Illustrations. 5s. 4d.
- Botany, Elementary.** By Dr. E. Drabbe. 2s. 10d.
- Botany, First Course of Practical.** By G. F. Scott Elliott. Illustrated. 7s. 10d.
- Botany, Lectures on Plant Physiology.** By Dr. Ludwig Jost. Translated by J. Harvey Gibson. Morocco back, gilt top. 24s. 6d.; cloth. 21s. 6d.
- Botany, Practical Plant Physiology.** By Frederick Keeble, Sc.D., F.R.S. Recommended for use in colleges and schools. 5s. 10d.
- Botany, Structural.** By D. H. Scott, M.A. 2 Vols.
PART I—FLOWERING PLANTS. 3s. 11d.
PART II—FLOWERLESS PLANTS. 3s. 11d.
An excellent introduction to the Anatomy and Life Histories of Plants.
- British Plants, List of.** By G. C. Druce, M.A. A detailed list of Species and Varieties. 2s. 9d.
- British Plants, The Uses of.** By Prof. Henslow. 4s. 9d.
- Bulb Book, The.** A Practical Work on Cultivation, Propagation, etc. By John Weathers. Illustrated. 15s. 7d.
- Bulbous Plants, Beautiful.** By John Weathers. 5s. 4d.
- Bulbs and their Cultivation.** By T. W. Sanders. 2s. 10d.
- Bulbs, The Book of.** By S. Arnott. Illustrated. 2s. 9d.
- Calendar of Garden Operation, The.** Based on the original work compiled by the late Sir Joseph Paxton, M.P. Adapted to the requirements of Cottage Gardeners, Allotment Holders, and Amateur Gardeners, by members of the staff of the GARDENERS' CHRONICLE. Illustrated. (New edition in the Press.) 1s. 5d.
- Cambridge Manuals of Science.** Cloth edition. 1s. 4d. each, post free.
- Plant Animals: A Study in Symbiosis.** By Frederick Keeble, Sc.D., F.R.S.
- Plant Life on Land.** By Prof. F. O. Bower, F.R.S., Sc.D.
- Earthworms and their Allies.** By F. E. Bedford, F.R.S.
- The Earth.** By Prof. J. H. Poynting, F.R.S.
- The Atmosphere.** By A. J. Berry, M.A.
- The Story of a Loaf of Bread.** By Prof. T. B. Wood, M.A.
- Bees and Wasps.** By O. H. Latter, M.A.
- Soil, The Fertility of the.** By E. J. Russell, D.Sc.
- Insects The Life Story of.** By Prof. G. H. Carpenter.
- Carnation Culture, Commercial.** Edited by J. Harrison Dick. A collection of treatises by the best modern cultivators. Illustrated. 7s. 4d. (81 50).
- Carnations, Perpetual Flowering.** By Laurence J. Cook. A Practical Manual with Details of Cultivation. Illustrated. Paper. 1s. 5d.; cloth. 1s. 9d.
- Carnations and Pinks.** By T. H. Cook, Head Gardener at Sandringham; James Douglas, V.M.H.; and J. F. McLeod. Contains 3 Coloured Plates, reproduced from colour photographs. 1s. 10d.
- Carnations, Picotees and Pinks.** By John Fraser. Fully Illustrated. 8d.
- Chemistry of the Garden.** By D. R. Edwards-Kerr. A course of practical work designed for the use of Teachers and Students of Gardening. 1s. 8d.
- China, A Naturalist in Western.** By Ernest Henry Wilson. Illustrated, in Two Volumes. 41 10s. 6d.
- Chrysanthemums.** By Thomas Stevenson. With Chapters by Charles E. Shea and C. Harman Payne. Contains 3 Coloured Plates. 1s. 10d.
- Climbing Plants.** By W. Watson, M.L.S. With Introduction by W. Robinson, author of "The English Flower Garden." 2s. 10d. and 5s. 10d.
- Coco nut, The.** By Edwin Bingham Copeland. 10s. 6d.
- Cottage Gardening; or, Flowers, Fruits and Vegetables for Small Gardens.** By E. Hobday. 1s. 9d.
- Cucumber Culture for Profit.** By W. Dyke. A Practical Guide to the Cultivation in Frames and in the Open. 1s. 2d.
- Cyclopædia of Botanical Drugs, Pothers.** By R. C. Wren, with additions by E. M. Holmes. Containing the Names and Properties of all the Herbs employed medicinally in this country. 3s. 10d.
- Cyclopædia of Horticulture, The Standard.** By L. H. Bailey. In 6 vols. Fully Illustrated in colour and half-tone. A valuable book of reference. Each part, 26s.
- Daffodils.** By the Rev. Joseph Jacob. With Preface by the Rev. W. Wilks, M.A. A full treatise on their culture for private and Exhibition purposes. With 3 Coloured Plates. 1s. 10d.
- Dahlia and their Cultivation.** By J. B. Wroe. 1s. 2d.; cloth, 1s. 8d.
- Dahlia.** By George Gordon, late President of the National Dublin Society. Contains 3 Coloured Plates. 1s. 10d.
- Date Growing in the Old World and the New.** By Paul P. Paganie. Illustrated. 9s. 6d.
- Dictionary of Hardy Flowering Plants** (see "The English Rock Garden," by R. Farrer).
- Directory, Horticultural** (see *Gardener's Chronicle* Horticultural Directory).
- Diseases and Garden Pests, Book of Plant.** By R. Hooper Pearson. 214 pages. Over 65 Illustrations. Cloth, 2s. 11d.
- Diseases of Cultivated Plants and Trees.** By George Masson. 7s. 11d.
- English Rock Garden.** By Reginald Farrer, author of "My Rock Garden," "Among the Hills," etc. This work contains up-to-date monographs of the Plants suitable for cultivation in the Rock Garden. The text consists of 500,000 words. 500 Plants are illustrated in Half-tone Plates. In 2 Vols. Price 4/2 2s. 10d. (in the Press).

NOW IS THE TIME TO PLANT KELWAYS

COLOUR BORDERS of hardy plants, arranged to give a succession of bloom during the Spring, Summer, and Autumn. NOW THAT LABOR IS SCARCE, these borders solve the difficulty of having a garden always in bloom without the trouble of re-planting and lifting the plants every year. Plant a border now, and you will be able to enjoy its beauty for several years without any additional expense. Send the measurements of your beds or borders, and we will recommend a selection of plants suitable for your district, and quote our special 10-bush War prices.

KELWAY & SON, Retail Plant Department, Langport, Somerset.

GRAPE VINES, Hard, short-jointed, and all kinds bearing, also Planting, &c. List on application. WILL TAYLER, Hampton, Middlesex.

SANDERS' Orchid Growers, 8, Abchurch Lane.

EXPENSIVE ADVERTISING. In these days, when every firm has to advertise or see business decline, it is now easy to make sure that the profitable publicity is so obtained that the results justify the expenditure. It is this consideration that has led to our keen business men to discontinue the wasteful method of advertising by catalogue. If enquiries be made any printing firm it will be found that catalogue printing has fallen away since the war by about 80 per cent., nor is this to be wondered at. The price of paper is nearly three times what it was ages ago, much to remark, so that the wholesale distribution formerly, printing rates are higher, and the cost of post of large catalogues is now too expensive for its own purpose. The new papers, though they themselves are produced at much greater expense all round, have nevertheless refrained from increasing their prices for advertisements, and it is by utilising these permanent notices that profitable advertising may still be practised.

SPORTSMEN, Farmers, Horsemen. Try our special Vardolite Whisky Case, wearable leather, sheep-proof, 7 yards for 17s. 6d. Patterns free. BRADFORD WOOLLEN CO. (71), Bradford.

GARDENERS' CHRONICLE, LTD., 41, WELLINGTON ST., COVENT GARDEN, LONDON, W. C. 2.

ONLY TO ORDER.

IN consequence of the decision of the Board of Trade, which will come into force on May 1st, to prohibit the return to publishers of unsold copies of any journal, the GARDENERS' CHRONICLE will be obtainable after that date only if ordered beforehand. We ask, therefore, all readers who desire a copy each week (and are not already receiving it direct from this office) to give their local newsagent a definite order to this effect

NOTES FROM A GALLOWAY GARDEN. V.*

WRITING last month, see p. 149 in praise of *Berberis pinnata*, *Mahonia fasciculata*, of De Candolle, I mentioned that I could recollect meeting with it, but two gardens beside our own. Since then I have had the privilege of examining the treasures in the paradise surrounding Carhayes, Castle in Cornwall, among which are several plants of the Barberry. They are young as yet, but will make a fine display when they attain to full stature. As I know that there is a fine specimen 15 feet high in the grounds of Cris Wall near Stratton where Mr. Carrick Binham has a collection of interesting plants, well-grown and well tended.

No genus of flowering plants has received from botanists a more appropriate name than *Chionodoxa*. We have not yet coined a good one in English, the literal translation of the Greek title, *Glow of the Snow*, being too general for everyday purposes, but how those little flowers have gladdened in this April of the Snow! In the frost never so keen, or the wind never so bitter, they never bow their bright heads. They run into considerable range of size and colour, all I presume varieties of the type *Chionodoxa*. Some bulbs which I scraped out of an Old copper at Cettling, in Montenegro, turned out to be small, but brightly coloured, form of the variety *Chionodoxa*, which bears nothing but having developed the white eye of the type. Most companions for the charming bulbs are *Sanguinaria*, *Narcissus*, and *Dog's Tooth Violet*, rose coloured and white; while the variety so preposterously named *gigantea* (it is but 6 inches high flowers a fortnight or three weeks later and accords well with the citron-coloured variety of hoop-petticoat (*Narcissus triandrus*) *Chionodoxa gigantea* varies a good deal in colour, having a tendency to unpleasant slaty grey and in one pink shade, which should be ruthlessly extirpated. The best forms bear pale sky-blue blossoms. It is not until the second season after planting that *C. gigantea* does much to justify the high praise it has received; but once the bulbs are established the blooms increase annually in profusion, and like all varieties of *Chionodoxa*, *C. gigantea* propagates itself freely both by seed and offsets. It is well worth the trouble of sowing and scattering the seed under choice deciduous shrubs such as *Viburnum Carlesii*, *Hammamelis*, *Einkanthus*, *Exochorda* and the like. I think I overhear some experienced gardener mutter: "Why so much fuss over a thing of such simple requirements as *Chiono-*

doxa?" But all amateurs are not experienced, and so many people have expressed disappointment with *C. gigantea* in its first season that perhaps this is one reason why it is not so often seen as it deserves to be.

Comparatively few amateurs seem to have realised the beauty of several North American species of *Dog's Tooth Violet* (*Erythronium*). The European and Asiatic *E. Dens-canis* is easily naturalised in British woods at least where pheasants do not abound. Where they do, the plant has not much chance of perfecting its seeds; for although rabbits do not molest the attractive foliage, pheasants pick off and devour every blossom. There are some pretty colour varieties in the common *Dog's Tooth*, but none can compare with the soft brilliance of *E. Johnsoni* from British Columbia, which is supposed to be a geographical variant of the Californian *E. revolutum*, though it does not poll back the segments of its perianth into so tight a Turk's cap as distinguishes that form. The generic name *Erythronium*, the *Ruddy One*, was assigned to the *Dog's Tooth* before the American species were known to European botanists. It now covers several species of which it is far from being descriptive. *E. americanum*, for instance, the yellow *Adler's tongue* of the Eastern United States, has flowers of a clear yellow, stained with purple at the base of the petals, and *E. californicum* carries many flowers of a stem nearly a foot high, the petals being more coloured with an orange-tinted base. The Western *Dog's Tooth Violets* form the subject of an interesting paper by Mr. Carl Purdy in *Elmer's Florist*, vol. 1, pp. 250-255, which should be studied by those who mean to cultivate these beautiful spring flowers. The best one for them is the "double" *Chionodoxa* or forest tree" says Mr. Purdy. "I have often seen *E. californicum* growing to a height of 6 or 8 inches with but a single flower; after a year it may be 10 inches or as much as 2 feet high, with from four to seven flowers."

I have said that rabbits will not eat the *Erythronium Dens-canis*, we have never given them the chance of sampling the American species, for the simple reason, I suppose, that they avoid "small" of the *E. californicum* and the *Dog's Tooth* is a number, from the strictly and smooth looking to the one 2 or 3 feet high in the common Wood Heath. *Erythronium Dens-canis*, like *E. americanum* and *E. japonicum*, throws the bulbs after a few months in a heap in the bar. East-west plants, and that are protected against the rabbit, are of course rabbit.

Mr. Purdy states that one of the American *Dog's Tooth Violets* is the white-flowered *E. Hartwegii*, because he collects from the soil. The genus *gigantea*, like the other species, is suffering since after flowering, which a new one form a good deal to be the next season's growth. This can hardly apply to the European species, which form large flowering clumps if left undisturbed. I intend to ascertain the mode of increase as soon as the leaves decay. The flower buds are more bare this year than they should be towards the end of April, which makes the curious shining nuts of the *Greening Grenville* (*Galiospermum purpuraceolum*) more conspicuous than an ordinary season. Rightly descriptive is the generic name of this plant. Stony seeded for the nuts are of flinty hardness, resembling white porcelain or dental enamel more closely than any vegetable product that I know of.

Early flowering *Rhododendrons* have had a chequered experience this season. On the whole they have fared better than during the mild spring of 1915, which had them into premature growth in 1, in the first week of May, a couple of nights of bitter frost turned all the fresh young shoots into black ruin. The cold weather which persisted throughout the first three months of the present year has acted in salutary restraint. New growth is only just starting now (April 21), and *R. arboreum*, which opened its first blooms on March 10 in 1915, have delayed display till

the present week. Of *R. barbatum* there are two forms, an earlier and a later. Of the earlier and more hairy variety, a bush about thirty years old began to flower here in February, and during a brief mild spell was a brilliant object with hundreds of blood-red blossoms. It is a sorrowful object now, with all its splendour turned to russet. The later form, with richer foliage than the other, is now taking up the running, showing how desirable it is to grow both forms, thereby securing a double chance of escaping frost. The rose-coloured variety of *R. barbatum* has not flowered with us yet, but it is almost better than the type.

Many of the newly introduced Chinese species start dangerously early into growth and flower; but they also have luckily been kept back by their ferocious spring. For instance, *R. pachytrichum* flowered last year on March 11, whereas it has only opened its first bell to-day (April 21). It is a desirable plant, the flower buds being bright carmine, opening to a pale rose coloured bloom. It is reported as growing to a height of 20 feet; but, unlike most *Rhododendrons* of arboreal habit, it begins to flower when a couple of feet high.

And now, speaking about *Rhododendrons*, let me make a clean breast of the folly whereof I have been guilty for an unaccountable number of years. It may serve to prevent others being led astray. Situated as our garden is, within a mile of the sea, we have been in immemorial habit of using sea-sand for propagating and cultural purposes. It answers well enough for such plants as do not abhor lime; but it never occurred to me that it is composed largely of triturated shells until lately I was staying with a friend whose Cornish home is within shooting distance of a beautiful sandy bay. He spoke of his difficulty in getting sand of the right sort for using in raising *Rhododendrons* from seed. I pointed to the abutment bay and asked if that was not good enough. "Seventy per cent of lime," was his terse reply. Returning home, I dropped soil plants and on some of our sand; it tizzed vigor only, and I became aware of the stupidity which had thwarted, and in many cases, entirely nullified, my attempt to raise *Heath* plants and lime-bud *Lilium* from seed. One lives and learns; the pity is that sometimes one has nearly done with living before learning. *Herbert Marshall, Monmouth*.

P.S. Writing yesterday, I accused the pheasants of nipping off the flowers of *Erythronium*. This morning reveals the fact that there is some other agent of the Evil One at work. A group of *E. revolutum*, around which were not long had been placed so as to render access by pheasants impossible, yesterday had a fine flower bud between each pair of mottled leaves. This morning every bud has been eaten clean off. Whether this be the work of a slug, a mole mouse, or a vole has yet to be determined.

ORCHID NOTES AND CLEANINGS

CYPRIPEDIUM QUARRYENSE.

A crown of this new hybrid, originally raised by Messrs. Armstrong and Brown, is sent by Francis Swanzy, Esq., The Quarry, Sevenoaks, with whom it has now flowered. The parents are *C. gigan* (*Harrissianum* s. *Lawrenceanum*) and *C. Guston Bulbif.* It is a fine, bold flower, of perfect shape, the petals, which are 1 1/2 inch wide, and the dorsal sepal (3 1/2 inches across), being flatly displayed. The hybrid is nearest to *C. Guston Bulbif.* on which it is an improvement. The dorsal sepal is white at the margin, the surface bearing a network of dark claret coloured lines on a pale rose ground. The petals and lip are tinged with rose colour, and have fine purple lines; the petals also bearing lines of purple spotting on the lower inner half. The undivided lower sepals are broadly ovate, pale green, with chocolate coloured lines.

* For previous articles see Jan. 13, p. 13; Feb. 17, p. 69; March 10, p. 105; and April 14, p. 149.

ORCHID SEEDS.

An interesting test made by Mr. J. Charlesworth, of Messrs. Charlesworth and Co., gives an estimate of the enormous number of seeds in a single capsule of many large-fruited Orchids. He selected a capsule of *Cymbidium Tracyanum*. The flower had been set with pollen of the same species, and in due time the capsule ripened. Mr. Charlesworth undertook the task of attempting to arrive at the approximate number of seeds by counting a determined proportion which had been previously weighed, and by comparison with the weight of the bulk, after making all allowances for a possible over-estimate. The total arrived at was 850,000 seeds in the ovary.

TREES AND SHRUBS.

ALANGIUM PLATANIFOLIUM.

This shrub has been grown in gardens for over 30 years, and will be known to many as

FIG. 58.—ALANGIUM PLATANIFOLIUM AT ALDENHAM

Marlea platanifolia. It is nearly related to the *Cornus*, though it has little in common with that genus so far as appearance is concerned. It is a native of Japan and China; Chinese specimens were collected by Mr. Wilson in 1907.

Alangium platanifolium is well worth growing as a foliage plant. In outline the sharply lobed leaves resemble those of the Plane, but are far more luxuriant, deeply veined, and richly coloured, this last characteristic making it conspicuous in a hot, dry season. The leaves average from six to nine inches across. The flowers, which are rarely seen, are small, white, and rather insignificant.

Strong, vigorous, pithy shoots three to five feet long are thrown up from or near the base every year, and these are liable to be damaged by severe frosts. The plant illustrated, growing at Aldenham, though severely cut this winter, has been pruned hard back and shows every sign of breaking out into growth this season.

The best position for this shrub is one not too much overhung by tall trees, and where there is plenty of room for development of the foliage.

BROWN AND GREEN OAK TIMBER.

WHAT is known in the trade as Brown or Red Oak timber is only found in this country, and in a very limited number of stations there. It should be understood that Brown Oak timber is a strictly English product that is more or less confined to the midland and eastern counties, and does not exist on the Continent. The largest and most valuable trees of this kind that I have had to deal with are growing on the Duke of Bedford's property, at Amptill, though probably a tree pointed out to me by the woods manager at Welbeck, which had been sold for £100, contained timber quite as valuable. At Ashridge, in Kent, there are many valuable Brown Oak trees, also in the famous Rockingham forest in Northamptonshire, where quite lately £105 and £76 were paid for trees of this type. There are other estates where Brown Oak timber is to be found, but the above are the principal.

Strange as it may appear, all the best trees

be brown from decay, and certainly many of those at Amptill, where some of the most beautiful wood is produced, are in such a condition. On the other hand, the highest-priced and most beautiful Brown Oak timber that I have seen was from a tree that was perfectly free from rot or blenish, and had not been pollarded. There is, however, considerable difference in the colouring and texture of wood produced by pollarded and unpollarded or maiden trees. The timber from the pollard Brown, or Red Oak, is usually of fantastic shapes in graining, with a great variety of beautiful figuring, owing largely to the growth being stopped vertically and spread over the butt end. It has been said that Brown Oak owes its colour to the activity of a fungus living in the wood, but specimens of the timber from Welbeck and Woburn fail to substantiate the statement. It is far more likely that the absorption of iron from the soil is the cause of the beautiful colouring in Brown Oak, and experiments now in hand tend to uphold this theory.

GREEN OAK.—The beautiful vivid green colour assumed by Oak timber under certain conditions is said to be due to the action of the parasitic fungus, *Peziza*, or *Helotium aeruginosum*. In this country Green Oak timber is comparatively scarce, the finest samples that I have seen being from an estate in Kent, and another in the North of Ireland. I learn that in lower Normandy a large number of the Pear trees have their wood coloured green, and in other parts of the Continent the timber of the Birch and Beech are similarly tinted. The appearance of the green colouring in the timber of the Oak is not an indication of disease in the tree, but rather of its having attained to maturity. Although in France it is known as "green rot," yet this is a mistaken appellation, as the timber is remarkably hard, and the texture unaffected, whilst the durability of the wood has been found to be quite equal to that of the ordinary Oak. Owing to the scarcity and high prices of Green Oak timber, experiments have been undertaken to produce the desirable green colour by artificial means, but without success. Green timber of Oak and Pear is much appreciated, both on the Continent and at home, for artistic cabinet work. Submerged Oak sometimes assumes a green colour, particularly when the timber is embedded in mud. *A. D. Webster.*

RAISING PLANTS FOR SPRING BEDDING IN 1918.

THE latter half of April is the best time to propagate *Aubrietias*, Mossy Saxifrages, *Phlox amœna*, *Phlox subulata*, and its varieties, *Arabis alba*, and its double form, *Primroses* and *Polyanthuses*.

Aubrietias should be attended to first, as they are very uncertain in rooting if dry winds prevail before they are established. The old stock plants should be divided, securing a portion of root to each portion if possible. If the old stems are long and wiry, make holes in the ground with a trowel, and curl the stems in them, making the soil very firm. The rows should be one foot apart, and the plants nine inches apart in the rows. The plants should almost cover the space by October. Saxifrages may be placed 6 inches apart in the rows, as they do not spread so wide as *Aubrietia*. The other plants mentioned should be the same distances apart as the *Aubrietia*. Although it may be impossible to pay so much attention to these plants as formerly, it will be well to raise fresh stock in order to preserve the varieties for future years, for if left too long in one position the old plants become weak, and are liable to die in hot, dry weather. *W. H. Divers, West-dean, Hook, near Subitton.*

ON INCREASED FOOD PRODUCTION.

BRUSSELS SPROUTS.

E. M. is quite right to insist (see p. 161) that Brussels Sprouts are the most valuable of green winter vegetables to the market gardener, but his standard of values is not the same as that which, in the present circumstances, the authors of the statement in the R.H.S. Pamphlet felt bound to adopt. In choosing crops to recommend they had to bear in mind the limited size of the garden with which they were dealing, and the urgent need for obtaining the largest quantity of food over as much of the year as possible. The choice lay between Savoys, Kale and Brussels Sprouts for the main supplies of winter greens. Comparison of the yields given by these crops under good cultivation showed that one might reasonably expect 2½ cwt. of Savoys from a square rod (and suitable choice of varieties will carry Savoys well into March), 1½-2 cwt. of Kale from the same area, or 75 lb. of Brussels Sprouts (or, including the tops, 100 lb.). These are average good market-garden yields, calculated over several years' cropping. There is no doubt which is the most remunerative crop from a market-gardener's point of view, but these figures amply justify the statement that Brussels Sprouts "give only poor returns" when judged by the quantity of food produced by them. *The Authors of the R.H.S. Pamphlet.*

LATE CELERY AS A GREEN VEGETABLE.

HAVING a surplus of plants when planting the main batch of Celery last summer, and fearing a shortage of vegetables, we planted a good number of the plants in a skeleton frame, 1 foot apart in the rows and 9 inches from plant to plant. The first week in December the stems were tied together loosely, and about 3 inches of soil was placed round the base of the plants. They are now (April 20) found to be extremely palatable. Trimmed, well washed, cooked whole and served as an ordinary green vegetable, they make an excellent and appetising dish, eaten either with a little butter or with cooked meat.

POTATO CROPS.

OVERGROWING is one of the chief causes of failure with Potatoes, and especially amongst mid-season and late varieties. The stronger-growing sorts, planted in wet, heavy land, need plenty of room for the light and air to reach the ground. That this detail is of the utmost importance can easily be proved by a careful examination of the outside roots and the outside rows, marking the difference between the yield and condition of the tubers as compared with those in the centre of an overrowed patch.

I do not agree with *J. P.* as to closer planting than is generally advocated. A space of 3 feet between the rows and 20 inches from tuber to tuber is a suitable distance for all main crop varieties. It does not follow that large tubers will be the only result; a heavier yield of a better quality will be obtained than when planted closer, unless, of course, the soil is very rich, light, and poor in quality, when the distance may be slightly decreased. *E. Beckett.*

SEED GROWING ON HEAVY SOILS.

The sowing of seeds, and especially small ones, in tenacious or clay soils that have been only a short time under cultivation, may lead to disappointment owing to the young plants being unable to penetrate through the surface of the soil. This difficulty is increased if the surface, after being trenched or dug, has been pulverised by the action of the weather, or the rake at the time the seeds were sown, and subsequently raked by rain before the young plants have had time to appear above ground. In

these conditions it is impossible for plants such as Carrots to break through. Difficulties of this kind may be overcome by carefully breaking the crust of the soil by tapping it with the teeth of a rake, which is best done immediately before the soil gets dry after being made wet by rain, or by the aid of a spray or rised watering-can. A better way, however, of dealing with this matter is to cover the seeds at the time of sowing with finely-sifted, light soil. I have adopted each of these plans with success.

My attention was last season drawn to a field sown with Mangolds upon which heavy rains had caused a hard crust to form upon the drills, beneath which the young plants were found to be in a curled state. The owner hesitated upon being advised to run a light horse-roller over the drills in order to break the crust, fearing the plants might thereby be seriously damaged. This was, however, ultimately done, and with perfectly satisfactory results. *Thos. Coomber, The Hendon Gardens, Monmouth.*

pinched out as soon as they began to run. The result was that they flowered profusely, and the pods being picked as soon as they were ready, a display of blossoms, with their marked contrast of scarlet and white, was kept up for a long time. This bed was not only generally admired, but it yielded a good return in the shape of edible pods. Another way in which I have noted Runner Beans grown so as to display their ornamental qualities to the best advantage was as a tall screen, and allowed to climb up lofty sticks. In this case the white and scarlet flowered forms were planted alternately, and owing to the marked contrast displayed, when at its best, was a very striking one.

Another class of vegetables well worthy of consideration for their ornamental features are the different Kales. In their case, of course, it is not the flowers but the foliage which is so ornamental, especially those in which the leaves are exceedingly curled and crisped. The

FIG. 50.—UTILISATION OF PLANT HOUSES FOR FOOD PRODUCTION IN MR. ELMOROLD DE ROTHSCHILD'S GARDENS, VIAREGGIO. (See p. 154.)

ENCOURAGE THE PLOVER.

THE beauty and utility of the plover (see p. 162) are indisputable, but it is not necessary to give up eating the eggs on that account. In Holland there is a large trade in the eggs, which are, chiefly, I believe, exported to this country. Almost every egg is taken up to May 1, after which date they are protected by law. Under this system the plover has largely increased in number, I suppose, owing to the fact that the later hatches of young would, in any case, have a better chance of coming to maturity than the very early ones. *Chas. E. Pearson.*

ORNAMENTAL VEGETABLES.

Your correspondent, *P. R. H.*, page 166, does well to direct attention to the fact that some vegetables, apart from their economic value, are well worthy of consideration from an ornamental standpoint. This matter was brought markedly home to me last summer, when I had under my observation a large bed filled with the Painted Lady Runner Bean. The plants were grown without sticks, and the tops

variegated kinds, too, impart a colour feature, quite distinct from the uniform green of the others.

Apart from the Beet and Parsley mentioned by your correspondent, the Asparagus, when the plume-like shoots are developed, is not only ornamental when growing, but useful when cut for arranging with flowers in vases for home decoration.

The Fan-like leaves of the Carrot, too, are very attractive, especially in autumn, when they acquire a reddish tinge, while as an ornamental foliaged subject the Endive must not be passed over, as well-grown plants are decidedly attractive. Of plants bearing a sub-tropical aspect, the Globe Artichoke is well worth growing for this purpose alone, while much the same may be said of the common Fennel. Now that we have an early race of Maize or Indian Corn, these plants will, given favourable weather, yield a number of much-appreciated cobs, as well as form an attractive feature in the garden. Other plants might be named; indeed, to many, the ornamental value of a uniform crop of nice young Cabbage is great. *W. T.*

THE SPRAYING OF POTATOS.

In order to put the means of spraying within the reach of allotment holders, and gardeners generally, the Food Production Department is ordering from the manufacturers a large supply of the best types of Knapsack spraying machines, and is making arrangements for the sending out in packets, ready for making up, of the materials for spraying. Particulars will be ready about May 1. For the benefit of those who have not had experience in the use of the Knapsack spraying machine, demonstrations by experts are being arranged in different parts of the country. An illustrated leaflet describing how and when to spray will be ready for issue in about ten days' time, and may be had free of cost on application to the Director of the Horticultural Section, Food Production Department, 72, Victoria Street, London, S.W. 1. The price of the Knapsack spraying machines which have been selected is £5 each, inclusive of packing and delivery. It will probably be found that the organisations that have been established in the villages will purchase these machines, and arrange for the carrying out of the spraying operations on the allotments, as the smaller cultivators would otherwise be unable to obtain the spraying outfit, even at the low price stated above.

THE CABBAGE ROOT FLY AND TARRED FELT DISCS.

REFERENCE to a trial made in the use in this country of discs of tarred felt for warding off the attack of the Cabbage-root fly has already been made in these pages. A full account of the trial has since been published.*

The damage done by the Cabbage root maggot—the larva of *Chortophila brassicae* is well known. Plants attacked by this pest appear to stand still and flag during periods of sunshine. The resultant loss of crop is often very considerable. Since the fly lays its eggs in the soil close to the plant, and since the larvae which hatch out have no great powers of travelling, American horticulturists conceived the idea of warding off the attack by placing a paper "collar" around the base of the stem of the Cabbage or Cauliflower plant. The first experiments, made by Prof. Tracy in 1897, were not successful, but when the paper was replaced by tarred felt—as was done by Prof. E. S. Goff in 1899 the experiment succeeded in a striking manner, and growers in America are now using the method on a large scale.

Mr. Wadsworth's tests of the value of the tarred discs are also favourable. With Cabbages, whereas 7.6 per cent. of unprotected plants were attacked, none out of a total of over 400 (plants) of the protected Cabbages suffered from the pest.

With Cauliflowers, 15.4 per cent. of the unprotected plants were attacked—72 out of 466—whereas not one of a similar number of protected plants succumbed.

Tarred discs ready for use may be obtained from F. Robinson, 13, Langdale Road, Victoria Park, Manchester. They should be put on soil which has been raked smooth, so that the discs lie flat on the ground, otherwise the female flies may crawl beneath them and deposit their eggs near the plant. The discs should be put in position immediately after planting out.

To ensure complete immunity from the Cabbage root fly the seedlings in the seed-bed must be protected. This, we believe, is done in America by screening the seed-bed with fine gauze or muslin. Much damage is undoubtedly done by the attack of this pest on planted-out Cabbages and Cauliflowers, and we recommend those who have in the past suffered loss from this cause, and who are not satisfied with other methods of prevention, to make use of the tarred felt discs.

* Report on a Trial of Tarred Felt Discs for Protecting Cabbages and Cauliflowers from Attacks of the Cabbage Root Fly, by J. T. Wadsworth, *Annals of Applied Biology*, III., 2 and 3, Jan., 1917.

THE KITCHEN GARDEN.

By J. DEXX, Foreman Royal Gardens, Windsor

BEET.—A sowing of Turnip-rooted Beet may be made now, and another in ten days' time, for summer supplies. Several sowings of Globe or Turnip-rooted Beet should be made throughout the next two months. This crop needs rich soil. The main crop of Beet need not be sown before the middle of May. Make a careful examination of all seeds which were sown early in March, and if their germination is not satisfactory, sow again before the season is too far advanced.

ASPARAGUS BEDS.—The surface of Asparagus beds should be carefully pricked over with the points of a digging fork as soon as the soil is sufficiently dry. Although this work may have been done early in the season, the recent heavy showers have flattened down the surface of the beds. The soil should be made as fine as possible, all hard lumps being broken small. There is no better time than the present for making new beds if the soil is sufficiently dry. If the ground has been prepared in winter by trenching and manuring, the surface should now be lightly broken up, and the roots placed in position, allowing at least 18 inches between the plants each way. A covering of three or four inches of fine soil from the space between the beds should then be placed over the roots as quickly as possible, as exposure to the sun and air is very injurious. In selecting a place for new beds heavy, stagnant soil should be avoided. Moreover, do not select a position which is exposed to rough winds, as this has a detrimental effect on the plants in the autumn unless they are secured to sticks or wires. Asparagus seeds may now be sown in drills 18 inches apart in order to produce a stock of young plants for future plantations. Sow the seeds thinly and keep the ground quite free from weeds during the summer months.

CUCUMBERS IN BOX FRAMES.—In order to maintain the necessary heat in these frames, frequent additions should be made to the fermenting materials which surround the box, and a covering of some dry material placed over the frames at night. The plants will now be making good progress, and will benefit by a top-dressing of light, rich soil, which should be applied before the plants have extended too far over the bed. Stop the shoots at the second or third joint beyond the fruit, according to the space, and never allow them to become crowded by permitting side shoots to run unchecked. Another sowing may be made to produce plants for succession. Sow the seeds singly in small, clean pots, and place them in a mild bottom heat. All The Year Round is a good variety for this purpose.

MUSHROOMS.—Beds made up at the present time either in a cool, open shed, or behind a north wall, will be more productive than those in an ordinary Mushroom house. If horse droppings are available, they should be collected and placed in a dry, open shed, where they should be frequently turned until a sufficient quantity has been prepared. When thoroughly sweetened, and when the temperature of the material is about 80°, the bed may be made up. Leave it loose until the heat begins to rise, then tread the droppings tightly, and spawn when the heat begins to decrease. The bed should be about 18 inches deep when finished, so that a mild heat may be retained in the manure as long as possible. If beds are made in the open the droppings may be placed behind a north wall and the bed made in a sloping manner 4 feet wide and about 3½ feet up the wall. This must be made quite firm by treading or ramming, and spawned at a temperature of 80°; the surface of the bed being made quite firm afterwards. In a day or two, when all chance of excessive heat is over, a covering of new loam should be applied, after which

a quantity of long litter may be spread over the surface to prevent evaporation.

TOMATOS.—Tomatoes for outdoor cultivation should now be ready for potting into 6-inch pots. Make the soil moderately firm, and place the plants in a temperature of 60° until they become established in the new soil. At this stage they should be freely ventilated, and gradually prepared for planting on a south wall about the end of May. Plants in pots which are ripening their fruits will benefit by a top-dressing of fine loam and artificial manure, and by frequent applications of weak liquid manure from the farmyard. Stop the plants as soon as a sufficient number of trusses has been secured, and remove all side shoots as they appear. A temperature of 65° should be maintained with sufficient ventilation to keep the atmosphere in a buoyant condition. Make another sowing to produce plants for fruiting in August and September. Grow these plants in a cool, well-ventilated house, and pot them on as it becomes necessary.

RIDGE CUCUMBERS may also be sown now and grown in a moderate temperature until they produce two rough leaves, then harden them gradually for planting early in June.

THE FLOWER GARDEN

By W. GURSE, Gardener to Mrs. DEMESTER, Keele Hall, Staffordshire

PERPETUAL-FLOWERING CARNATIONS.—Old surplus plants of Perpetual-flowering Carnations from the greenhouse will provide large quantities of flowers through the summer and autumn if they are planted outside in beds or borders. Prepare the ground as for border varieties, and take care to rid the soil of insect pests. Guard against deep planting, which might cause the stems to rot. Allow space between the plants to facilitate the work of watering, hoeing, and tying. Make the soil firm about the roots. During warm, dry weather liberal waterings and syringings are necessary. The following are a few of the best varieties for planting outside:—Britannia, Mayday, Mikado, Mrs. C. W. Ward, Mrs. H. Burnett, White Empress, Lady Alington, British Triumph, and Duchess of Devonshire.

THE WATER GARDEN.—It may be necessary to divide and replant some of the stronger-growing plants near the water's edge; for instance, *Gamora maritima*. Certain of these moisture-loving plants are gross feeders and require plenty of decayed manure. Water plants usually remain in an excellent condition of growth for many years, and should not be disturbed unless it is absolutely necessary. Remove dead foliage and rubbish, and apply suitable top-dressings to plants that require it. Trees in variety, *Callias* (Marsh Marigolds), *Spiraeas*, *Tritomas*, *Ranunculuses*, *Astrantias*, *Myosotis palustris*, tall *Polygonums*, *Cimicifugas*, *Hemocallis* in variety, *Funkias*, *Epilobiums*, *Lythrums*, *Arundo conspina*, *Bocconias*, *Arundo Donax* (a very effective plant), *Phragmites communis* (the Golden Margined Water Reed), *Aconitums*, *Richardias*, *Primulas*, and *Liliums* are all suitable for planting by the waterside. Certain *Liliums* also thrive in marshy places, but they will not tolerate stagnant moisture, and peat should be used freely when planting them.

STANDARD BEDDING PLANTS. Plants intended to be trained as standards for the flower-beds should be neatly staked, and all side growths removed as they appear. Directly the plants have grown to a suitable height, pinch out the points of the leading shoots to form a "head." The plants should be re-potted as they require increased root-room. *Fuchsias*, *Heliotropes*, and *Pelargoniums* require only a moderate heat. Frequent waterings and syringings are necessary, with occasional applications of liquid manure or concentrated fertiliser. Apply top-dressings of rich material to large specimen plants in tubs and vases.

AGAPANTHUS UMBELLATUS.—*Agapanthus umbellatus* is a gross-feeding plant, and should be given manure-water at frequent intervals.

If the plants were not re-potted last autumn they should be given a shift without delay, or a top-dressing of rich loam and decayed manure may be given instead.

HYDRANGEA.—Plants of *Hydrangea hortensis* in tubs should have the surface soil removed, replacing this with rich, loamy compost. Very little pruning is necessary beyond removing exhausted or decayed wood. Liberal supplies of water and frequent applications of liquid manure are essential to produce fine heads of bloom. The plants should be allowed to remain in a cool house for the present.

EVERLASTING FLOWERS.—*Helichrysum* gives flowers of several beautiful colours. The spikes should be cut before the blossoms are fully expanded. *Statice*, *Xeranthemum*, *Arochidum*, and *Rhodanthe* are also showy genera. The seed should be sown now to raise plants for flowering in summer.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. F. Davry, Abbots Wood, Godalming, Surrey.

THE LACKEYING MOTH (CLISSIGMOGA NEUSTRIALIS).—This moth is very destructive, especially to Apple and Pear trees. The eggs are deposited in the autumn in close rings around the branches. The rings often contain from one to two hundred eggs, which usually begin to hatch in mid-April, but they may be later this year. The grubs very soon form a web, which embraces both fruits and shoots, on which the insects feed voraciously, and cause great injury to the tree. To combat this pest, spray with arsenate of lead. Isolated cases may be dealt with by hand picking, either by using the grubs or dropping them into a pail containing a strong insecticide.

FIGS.—If Fig trees are starting into growth and frost continues, let them have some temporary protection, even if it is removed daily, as the young growths are very tender and sensitive of cold and frost.

APRICOTS. Apricot trees are much later in developing their growth than most this season, and especial efforts must be taken against insect pests which are most harmful when growth is slow. The trees should be sprayed with insecticide twice a week as a preventive.

INSECT PESTS. Keep a sharp look-out for aphid on Peach and Nectarine trees. *Pectinophora gossypiella* is a suitable species for this pest, and it should be applied as a very fine wet spray to the foliage early in the day, wetting every part of the leaves. In these early days, when growth is slow, aphides, if allowed to spread, would destroy many of the flowers. Watch the spray for 7 or 8 days, and if not matter in the least if it wets the flowers, spray, do they live one day again before nightfall. Continue to spray down the plants at night in case of severe frost until the blooms are set, leaving nothing to chance.

TREES IN ODD CORNERS.—See that no tree has escaped notice in pruning, remembering that even if it grows in an out of the way place it has still a purpose to serve. A good mulch of manure will greatly assist growth.

FRUITS UNDER GLASS.

By JAK HIBSON, Gardener to Mr. LEBOLD DE ROTHSCHILD, C.V.O., Gunnersbury House, Acton, W.

FIGS IN POTS.—Figs raised from cuttings inserted early in January should be ready for shifting into 8 in. pots (2½'s). In these pots they will, if kept growing without a check, yield a few fruits by September, without in any way harming them for another season. Bottom heat will not be necessary, nor fire-heat, during the hottest months of the year. Our plants of late Figs in pots are starting well into growth. They are syringed daily and watered a little more freely than hitherto. The plants will soon need more room to prevent growth becoming weakly and attenuated, but until the other kinds of fruits in pots are cleared from the houses, it will not be possible to give them all the room they need.

STRAWBERRIES IN POTS.—May is probably the most critical month for Strawberries in pots, and the grower must exercise great care in guarding against attacks of red spider. A vinery, even if it be the late house, is scarcely suitable for Strawberries during the coming month. A late Peach house is better, but even there a sharp watch must be kept for the pest. It, however, the advice previously given to dip the plants in a pallid of sulphur and water is followed, it will have done much good. The berries will ripen now in a cool house if exposed to the sunlight. Do not give in excess of water at the finishing stage of the fruits, or the flavour will be impaired. As soon as the crop is cleared, if the plants are required for planting out, remove them either to a cold frame, or to the open, under a north wall. I prefer to gather the berries in the morning rather than later in the day; they are then finer and pack better. Endeavour from now onwards to start the latest batches in cold frames or pits. The flower trusses will soon be showing even on plants still in the open. Admit air to the frame or pit both night and day in order to keep the conditions drier. Make a note of the requirements for next season's forcing, and reduce the stock whenever possible to save labour. A saving of labour in watering may be effected if the pots are plunged to their rims in frames. The lights may be removed entirely for a part of the day.

THE ORCHID HOUSES.

By J. G. HARRISON, Gardener to Sir Benjamin Flower, Bart., 10, Grosvenor Place, London, W.

CATTLEYA, LAELIA, AND LALIO CATTLEYA. Many a grower has heard of Cattleya and Laelia, and even of the Lallio Cattleya. It is not, however, the Cattleya which is called the orchid, but the Cattleya of the Atlantic, *C. Hopleyana*, also called *Cattleya*, with which are the *Laelia* hybrids, and many *Brassavola* hybrids that flower during the late autumn and winter, and developing new roots from the base of the front pseudo-bulbs, and this is the best time for potting the plants. Healthy specimens that require a second rooting stage should be transferred to larger pots, taking care, if the same pot is in a moist condition, not to disturb or injure the roots more than necessary. If the roots, being so firmly to the sides of the pots that the plants cannot be taken out without damaging the roots, break the pot over the purpose. Every specimen that is one of the pot should be inspected and should be given a smaller pseudo-bulb, or the more desirable than that of more than 2 or 3 other, but away are the pseudo-bulbs that are being taken off, retaining only two or three behind the head. Plants that have sufficient pot room and are in a satisfactory condition at the roots may be top dressed instead of re-potted. Remove some of the old compost from between the roots, and replace it by fresh material. Unhealthy plants growing in a poor soil should be taken out of the pots, their decayed roots and useless pseudo-bulbs cut away, and the plants placed in receptacles only just large enough to accommodate them. Those with long, heavy pseudo-bulbs should be secured firmly to strong stakes. The old pseudo-bulbs that have been taken off may, if they possess sound eyes at their base, with a portion of the rhizome, be placed in small pots with plenty of drainage, and a little *Sphagnum* moss, giving them a position in a moist part of the house. It is advisable to start all newly potted plants together at the warmest part of the house, and keep them shaded from direct sunshine, giving them special treatment in the matter of shading, watering, and spraying. For a few weeks they will need very little direct watering at the roots, but they may be sprayed overhead whenever the weather is favourable. The surroundings should be kept moist by frequently damping between the pots, until root action again becomes general, when they may receive ample supplies of water at the roots and reasonable exposure to the sunlight. Use as a potting medium either *Osmunda* or *Alf* fibre, cut rather short, or small portions of crushed crocks and Splag-

num moss. *Cattleya* and *C. Warscewiczii*, and their hybrids are now starting into growth, but should not be too liberally supplied with water at the roots until the young shoots have attained the height of 2 or 3 inches. The plants should be exposed to more sunlight than is usually allowed others of this genus. This latter remark also applies to *Brassavola* and its hybrids.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcote, Eastwell Park, Kent.

TREE FERNS. These Ferns are most ornamental for the conservatory and show house, and for standing in tea houses, corridors, or balconies during the summer. The plants are producing new fronds, and should be given a little extra attention. Healthy vigorous plants growing in large pots or tubs, need not be disturbed at the roots. If given an abundance of water, and a generous supply of stimulants, Tree Ferns may be grown in the same receptacle for many years. Encourage the development of new growth and roots by syringing the stems two or three times daily. Tree Ferns thrive excellently in large coarse varieties or planted out in borders; and as they do not soon outgrow their positions they are more manageable than Palms. *Dicksoma antarctica* is probably the most popular of these Ferns, the growth being robust and healthy. *D. squarrosa* is also a free grower; whilst *Cyathea medullaris* and *C. dealbata* are both suitable for cool greenhouses and remain in better health than when grown in warm, close houses. *Asplenium australe* and *A. exelsa* can also be grown in the same conditions, but these are scarcely equal in beauty to the *Dicksomas* and *Cyathes*. Tree Ferns in full growth need constant supplies of moisture, both at the roots and stem, and the fronds should be syringed regularly. Syringing will help to keep the plants free from thrips and other insect pests.

HYDRANGEA.—Plants of *Hydrangea* started into growth in heat early in the season should be afforded stimulants regularly when in full growth. Those that have been grown in a cool place during the winter should be brought into a slightly warmer house to finish a succession to the early batch in flower. It is best to keep the roots dry, but do not give them much water until growth is further advanced. *H. hortensis* and *H. paniculata grandiflora* are valuable for decorative purposes. The newer varieties, *Avalanche*, *General Annettes de Villars*, *Mme. E. Moulleure*, *Maesata*, *President Edières*, and *Radiant* are great acquisitions.

PRIMULA OBOCNICA. Plants of *Primula obconica* should be well supplied with soft water and weak liquid manure about twice weekly. Shade the house during bright sunshine, or the flowers will quickly lose their brilliant colouring.

PRIMULA KEWENSIS. This yellow flowering plant thrives in treatment similar to *P. obconica*. If a batch of *Primula kewensis* is required for early flowering the seed should be sown now. Use light, sandy soil, making it firm in the pans or pots, and water, if before sowing the seed, or pots, and water, if before sowing the seed or pots. The slightest sprinkling of soil or sand on the seed is all that is required. Place a pane of glass over the pan, and germinate the seeds in a warm house or frame. Shade from sunshine, and take care that the soil never becomes dry, for neglect in this respect is often the cause of minute seeds failing to germinate. Apart from their usefulness as pot plants, both *Primula obconica* and *P. kewensis* are suitable for planting under the greenhouse stages at the edges of the path-way, and are especially effective if a little rock-wool is introduced. There are other plants suitable for such places, including *Begonia Rex*, Ferns, *Aspidistras*, and *Cinerarias* of the stellata and cactus flowered types. Others of mossy or creeping habit may be utilised to fill spaces between the flowering plants.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C. Editors and Publisher—Our correspondents would oblige delay in obtaining answers to their communications and save us much time and trouble, if they would kindly advise the authors printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents—The Editors do not undertake to pay for any contributions or illustrations, or to return valued communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the paper, sent us early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the closing week deduced from observations during the last fifty years at Greenwich, 43.5.

ACTUAL TEMPERATURE—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, April 20 (10 a.m.): Bar, 30.1; temp. 48.5. Weather, Sunny.

Food Production under Glass.

Many gardeners are making good use of their glass-houses for the purpose of increasing food production, but it may be doubted whether there is to be seen anywhere in the Kingdom such a remarkable demonstration of what may be done in this direction as that in Mr. Leopold de Rothschild's garden at Ascott, near Loughton Buzzard. Recognising that the food problem was bound to become more and more serious as time went on, and desiring moreover to maintain throughout the year as large a supply of fresh vegetables for the hospitals in which Mrs. de Rothschild and himself are interested, Mr. Leopold determined last winter to raise the largest possible quantity and the greatest possible variety of vegetables under glass. As he himself puts it, "I have turned Ascott and Gunnersbury into market gardens."

In carrying out this programme Mr. Rothschild has the advantage of the assistance of three able gardeners—Mr. Hudson and Mr. Reynolds at Gunnersbury, and Mr. Jennings at Ascott. Mr. Jennings, whose work we have now to describe, has been with Mr. Rothschild for fifty years; yet, in spite of this long period of service, he is as vigorous as the plants he grows. Among the most striking crops which are now being raised at Ascott are the Potatoes. The "seed" was planted on January 9, and no attempt was made to force the plants, which, in fact, were grown as "cool" as possible. The varieties planted are Sharpe's Victor and Sharpe's Express, both of which are producing excellent

crops. These new Potatoes are at least as good as any in the market. One of the two large, span-roofed houses planted with Potatoes is shown in fig. 60. The seed tubers, it should be added, were planted in borders, well drained, and raised about a foot from the ground. In a third small house the crop, now in large part lifted, was grown in a centre bed, with 1 foot of soil. As the Potatoes are lifted, their place is taken by Cabbages of the variety Harbinger, which, planted at 1 foot apart each way, are growing vigorously.

The most remarkable feature of all the vegetable crops is their vigour; they seem to have suffered not a jot from the extraordinarily sunless season through which we have passed.

On the side stages of the last-mentioned house, with Potatoes in the centre, Cabbage Lettuce has been planted, and is ready for use. The variety selected is Paris Market, and the plants growing in a bed, with 6 inches of soil, have made wonderful growth. Another division of this house is devoted mainly to French Beans in pots. The plants are vigorous and clean, and are producing a heavy crop.

Mr. Jennings is carrying out the programme laid down, namely, to produce all the food that can be produced in the most thorough-going manner. Up every column and pillar of the houses climbing French Beans are growing. The borders of the narrow Apricot houses are planted with strong dwarf Cauliflowers, and on either side of the Potatoes in the span-roofed houses already mentioned is an early Pea of Mr. Jennings' own raising. The variety is one on which the raiser deserves to be congratulated. From 4 to 5 feet high, it begins to bear very near the ground, and continues to the top of the haulm. Although single-podded and round, it bears very freely, and is of excellent flavour. The pods are of medium size, and are well filled. In front of the Peas are "borders" planted with Cabbages (Harbinger) and Early April, Cauliflower (Fore-runner), and Lettuces (Paris Market and Paris Green).

To make room for more vegetables which are already outgrowing their seed-beds, the Roses planted out in beds in another large house are to go. The Carnations, which are always such a beautiful sight, are, however, to be allowed to remain in part, for the hospitals require flowers as well as fresh food. The formal garden will have to rely on vegetables for its formality. It has been cleared, and is now ready for planting.

Needless to say, with the example of Mr. Leopold de Rothschild before their eyes, the inhabitants of the villages of Ascott and Wing are also doing their utmost to produce ample food crops.

Of the 284 cottages in Wing 126 have gardens. Fifty-seven of these are of 10 rods or upwards. For those who have no cottage garden, or whose garden is small, allotments are provided. At Lenslade the allotment ground measures 28½ acres, and is divided into 170 plots, ranging from 10 to 40 poles each. At Wing there are

three allotment fields: Ceffs Close (3½ acres), 56 plots of 10 poles each; Moor Hills (5 acres), 40 plots of 20 poles each; and a third, Ayr (2½ acres), at Moor Hills, is now being broken up to provide yet another 18 plots of 20 poles each. Moreover, for the inhabitants of Wing, Lady Wautage has provided 23 acres of allotments, which are cultivated by 174 people.

Thus in Ascott and Wing there are no fewer than 617 plots (allotments or cottage gardens). The soil, though for the most part of a sandy nature, is fertile, and the fact that each allotment holder receives a load of manure accounts in part for the excellent condition of the ground. What chiefly accounts for it, however, is the industry with which the allotment-holders cultivate their ground. On the day of the visit to Ascott, of which the foregoing is a brief impression, the Director of Horticulture recently appointed by Sir Arthur Lee, of the Food Production Department, had been asked by Mr. de Rothschild to give an address on the importance of food production, and it needed all the kindly persuasion of Mr. Leopold to detach the allotment-holders from their work on the ground. However, all went to the meeting, and agreed enthusiastically that everyone at Ascott should try to do more even than he was already doing to produce food.

It should be added that the work in the glass-houses at Ascott has been carried on in spite of the labour difficulties, which are as acute there as elsewhere. Old men and young women have to do the work, and it says much both for them and for Mr. Jennings' energy and power of organisation that Mr. Leopold de Rothschild has succeeded in giving such a splendid demonstration of food production under glass.

HORTICULTURAL CLUB—The next house dinner of the Horticultural Club will take place at 6 p.m., on Tuesday, May 8, at the Hotel Windsor, Victoria Street, Westminster. In the course of the evening Mr. J. K. RAMSBOTTOM will deliver a lecture on "Investigations in Fusarium Disease of Daffodils," illustrated by a series of lantern slides obtained during the investigations carried out at the Royal Horticultural Society's Gardens at Wisley.

SEEDLING ROSES AT THE DRILL HALL.—As was announced in the *Gardeners' Chronicle* for March 31, p. 156, owing to the exceptional circumstances now prevailing, and the call for National Service, the Council of the National Rose Society has cancelled the summer show, which was to have been held at the Royal Botanic Gardens on Friday, July 6, 1917. In order, however, that nurserymen and others may have an opportunity of exhibiting their novelties, arrangements have been made, in conjunction with the Royal Horticultural Society, for holding a special display of seedling Roses at the Drill Hall, Buckingham Gate, on Tuesday, July 17, and also for an autumn meeting to be held in the same hall on Tuesday, September 11, 1917.

FORESTRY AND HYGIENE.—Prof. A. HENRY will deliver, under the auspices of the Chadwick Trust, three public lectures at the Royal Society of Arts, Adelphi, London, on May 8, 11, and 14, at 8 p.m. The subject of the lectures will be "Forests, Woods, and Trees in Relation to Hygiene."

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

FRUIT PROSPECTS AND MULCHING (see p. 161).—It would be instructive to know in what way the early mulching of Strawberries increases the risk of the flowers being damaged by frost. A mulch of fresh straw, cow dung applied during February should diminish this risk because the straw will have been washed by rain to a lighter colour than the soil, and the manure will keep the soil colder; this helps to retard the flower-spikes, until such times as frost may be past. Possibly the ideal time for mulching bush fruits is as soon as it can be seen that the crop will be worth the labour; to apply it earlier means waste of labour and manure, as barren bush fruits are in most gardens better without a mulch. To apply it later may possibly mean the loss by evaporation of valuable water stored in the soil from earlier rains. *J. E.*

THE FLOWERING OF THE ALMOND.—The Almond tree growing near Wandsworth Common, about five miles from the centre of London, the flowering of which is observed by us every year for purposes of comparison, is only now (April 23) partly in bloom. The unusual severity of the winter and early spring has retarded every sort of growth, and the Almond shares with many other trees an altogether abnormal lateness in flowering. The tree has been observed each year since 1904, and the dates, reckoning backwards from 1916, have been as follows: February 13, March 9, March 2, January 25, February 24, March 11, March 12, April 1, March 25, March 20, February 23, March 7, March 21. Last year the date of flowering was the earliest but one, in consequence of a mild winter and early spring. This year the date is three weeks behind the latest hitherto recorded, namely, April 1.

MR. EDWIN MOLYNEUX.—The many friends of our valued correspondent, Mr. EDWIN MOLYNEUX, farm steward at Swanmore Park, Bishop's Waltham, will hear with deep regret of the death of Mrs. MOLYNEUX after an intermittent illness, lasting several months. Young gardeners who passed through Swanmore during the years that Mr. MOLYNEUX had charge of the gardens will recall the pleasant personality of Mrs. MOLYNEUX, whose kindness to the many visitors to Swanmore will not soon be forgotten. For several years past Mr. MOLYNEUX has received valuable help in gardening and other matters from his only daughter, who will now be called upon to fill the unfortunate gap left by the bereavement.

WAR ITEMS.—M. JEAN DE VILMORIN, brother of M. PHILIPPE DE VILMORIN, has been appointed a Captain in the Cavalry regiment in which he is serving at Salonica. M. PIERRE DE VILMORIN, the youngest son of M. MARCEL DE VILMORIN, has been awarded the War Cross for gallantry. M. PIERRE DE VILMORIN is only eighteen years of age.

— Lieutenant R. F. AMPHILL of Paradise, Wolverhampton, eldest son of his Honour Judge R. H. AMPHILL, was killed in action on the fifth inst. He was a member of the Wolverhampton Town Council, and secretary to the Wolverhampton Floral Fete Committee.

— We regret to learn that Captain DOUGLAS CRETNEY, M.C., of the 5th Middlesex Regiment was killed in action on the 10th inst. Captain CRETNEY was the elder son of Mr. W. H. and Mrs. CRETNEY, of the Barnet Nurseries. He was educated at Bognor and Tonbridge, and attained his majority last month. He spent some time in the bulb fields of Holland, but at the outbreak of war was in Orleans, France. He came home immediately, and on his arrival in England offered himself for the Army, but was rejected as medically unfit. He then assisted at the Alexandra Palace with the Belgian refugees until after Christmas. He was taken ill at the Palace, but recovered, and was given a commission in the 5th Middlesex Regiment in May, 1915, and was sent to the Front in October, 1915. In January, 1916, he was wounded by gunshot in the thigh, and was in hospital and on light duty for some weeks. On November 10 he was awarded the Military Cross, and the following notice appeared in the *Gazette*: "He displayed great courage and ability in reorganising his company, and consolidating the position under heavy gunfire. He set a fine example." The commanding officer has written to Mrs. CRETNEY as follows: "His loss is our loss as well as your, as he was an exceptionally keen, brave, and capable officer, and greatly beloved by all his brother officers." He led his company, of which he had command, with skill and judgment, and exposed his own person with an absolute disregard of fear. At the time of his death his company was under heavy machine gun and sniper fire, and he was struck in the head by a bullet."

SOCIETIES.

ROYAL HORTICULTURAL.

APRIL 24.—The fortnightly meetings, held in the London Scottish Drill Hall at Buckingham Gate, are attracting increasing numbers of visitors, and the exhibits are also more numerous than in the early part of the year. The weather on Tuesday last was exceptionally fine, and this circumstance added to the success of the meeting. The National Aricuta and Primula Society held its annual exhibition in conjunction with the R.H.S. Show. There were several interesting exhibits of Primulas, but the war had its influence on this show as on others.

In regard to the R.H.S. exhibition, Orchids, Daffodils, Roses, Carnations, Ferns, forced Shrubs, and Alpines comprised the main features. Probably the finest exhibit was a group of Narcissi staged by Messrs. BARR AND SOXS, which received a Gold Medal. Messrs. DORRIS AND CO.'S exhibit of Tulips was

FIG. 60. VEGETABLE CROPS IN THE GLASS HOUSES, AT ASCOTT (See p. 174.)

DAFFODIL FLIEB.—Daffodil growers may be reminded that at present is a good time to look for the pupae of the Merodon grub, which are much later this season than usual. During the past week I have collected from the plots in which the bulbs were not taken up more than twice as many pupae as all the flies caught last year. Even here, in the comparatively warm climate of South Devon, they had evidently only recently pupated, as I also found two grubs which had just left the bulbs preparatory to pupating; and in more northern districts they will probably be a week or more later. Where the bulbs are planted singly in rows, it is easy to note a blank; but where the bulbs have been indiscriminately for two or three years a failure is not nearly so obvious. The pupae are always found just above the undflowered bulb within less than a 2 in. radius, and about half an inch below the surface, to an inch at the most. After a very little experience, they are quite easily found by scraping away the soil over and around the suspected spot with the pointed end of a label. *A. J. Bliss.*

also of outstanding merit. Several noted Rose growers brought collections, of which the blooms were of more than ordinary merit, especially considering the late mid-winter weather. Mr. EUSTIA THOMAS' group included the species *R. Willmotiae*, which bears delightful little blooms of delicate rose-pink colour, and the prickles stand out conspicuously; the sulphur yellow flowered *R. Hugonae*; and *R. Mueyssi*, with crimson blossoms.

Messrs. B. R. CANN AND SOXS showed some superb blooms of Edward Maxwell, and fine flowers in vases of the new H.T. Lady French. Messrs. FRANK CANN AND CO.'S exhibit was chiefly remarkable for some magnificent blooms of Mrs. Foley Hobbs.

Perpetual-flowering Carnations, which have formed a feature of the shows all through the winter, are decidedly improving as the weather becomes warmer and finer. Messrs. ALLWOOD BROS. and Messrs. STURANT LOW AND CO. both displayed extensive groups of the best varieties. In addition to the Carnations, Messrs. LAW AND CO. showed a collection of Aeneas and the

beautiful clear blue *Leschenaultia biloba* major. Messrs. W. CUTBUSH AND SONS showed forced shrubs covered with bright flowers, amongst which Labacs and Azaleas were especially prominent.

A pleasant change from the bright masses of flowers was afforded by a long table of exotic and hardy Ferns, staged by Messrs. H. B. MAY AND SONS. These beautiful foliage plants are never more attractive than in spring, with the delicate young fronds of tender green. Messrs. H. CANNELL AND SONS' collection of Zonal Pelargoniums included old favourites as well as the newer sorts. Specialists in Alpines and hardy flowers contributed large groups of Saxifrages, Androsaces, Primulas, and Anubrietas. Mr. G. REUTHE'S collection included the beautiful Teco-

Pearson, B. CRISP, J. P. McLeod, H. J. Jones, H. C. Cowley, R. W. Wallace, J. Dickson, C. Dixon, S. MORRIS, C. Elliott, C. E. Pearson, E. H. Jenkins, J. Hudson, C. E. Shea, and W. A. Binley.

AWARD OF MERIT.

Androsace villosa.—This dwarf Alpine from the Pyrenees forms a dense, cushion-like growth, consisting of a series of rosettes, the taller of which, in the centre, had nine flowers. Each side-shoot was also flowering profusely. It is a plant of dainty appearance, the relatively large flowers being of rosy-carmine colour, with a deeper coloured eye. The specific name is from the ciliated margins of the leaves, which are imbricated and of oblong-lanceolate shape. Shown by Messrs. R. TUCKER AND SONS.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), W. Bolton, W. H. White, Walter Cobb, J. Charlesworth, T. Armstrong, C. J. Lucas, Paulia Ralli, R. G. Thwaites, F. J. Hanbury, R. A. Rolfe and R. Brooman-White.

AWARD OF MERIT.

Laelio-Cattleya Scriba var. perfecta (L.C. St. Gothard × C. End), from Messrs. CHARLESWORTH AND CO., Haywards Heath. This is the third variety of this fine hybrid to be recognised by the Orchid Committee, and the best in colour and size. Although it is the third remove from its ancestor, *Cattleya Warneri*, one of the parents of L.C. Gottoiana, that fine and distinct species asserts itself with enhanced qualities in the hybrid. The flowers, which are of the largest in *Cattleyas*, are of perfect form, the segments overlapping and well arranged. The sepals and petals are light rose colour, the lip is purple with a lilac margin and orange-coloured disc, into which light purple lines run from the base.

PRELIMINARY COMMENDATIONS.

Odontoglossum crispum Dreadnought (see fig. 61), from Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells. A grand seedling, obtained by crossing two finely-blotched forms of *O. crispum*, and resulting in a richly-coloured flower the like of which has never appeared among imported specimens. The flower, although the plant is small, is large and perfectly formed. The sepals and petals are of bright reddish-chariot colour with white margins, the lip being white blotched with dark red in front of the yellow crest.

Odontoglossum Rex (*O. crispum* × *O. hybrid unrecorded*), from Messrs. ARMSTRONG AND BROWN. A large flower with white ground; the inner parts of the segments are densely spotted with mauve-purple, the fine labellum being a specially attractive feature.

GROUPS.

MESSRS. ARMSTRONG AND BROWN were awarded a Silver Flora Medal for an attractive group of hybrids, *Miltonia Iycaea sandhurstensis* is a fine white flower with a faint tinge and veining of pink and a reddish-bronze mark on the lip.

MESSRS. CHARLESWORTH AND CO., Haywards Heath, were awarded a Silver Pansian Medal for a group rich in *Odontoglossums*, *Odontodas* and *Laelio-Cattleyas*.

MESSRS. SANDER AND SONS, St. Albans, staged a group of *Laelio-Cattleyas* and other hybrids and interesting species. Novelties were *Laelio-Cattleya Watsoni* (L.C. Cauhamaiana Rex × C. *Schroderae* albata), a pretty white flower with violet-coloured blotch on the lip, which has a yellow disc and purple lines at the base.

Narcissus and Tulip Committee.

Present: Mr. E. A. Bowles (chairman), Miss E. Willmott, Messrs. Joseph Jacob, Herbert Smith, W. F. M. Copeland, F. Herbert Chapman, George Moore, jun., R. W. Wallace, J. D. Pearson, and Chas. H. Curtis (hon. sec.).

There were several nominations for the awarding of the Peter Barr Memorial Cup "for good work done in connection with Daffodils"; the voting was unanimously in favour of Mr. Walter T. Ware, of Inglescombe, Bath, who will hold the cup for the ensuing year.

AWARD OF MERIT.

Narcissus Michael. A bold, shapely, trumpet variety of large size, and deep, solid, golden-yellow colouring. This variety was raised by Mr. J. C. Williams, and exhibited by Messrs. BARR AND SONS, Covent Garden.

GROUPS.

The most important exhibit was a large group of cut Daffodils staged by Messrs. BARR AND SONS, for which a Gold Medal was awarded. The flowers had come chiefly from the firm's nursery at Rosemorn, near Penzance, and were notable for their fresh, clear appearance. Trumpet and giant Leedsii forms were conspicuous among the two hundred varieties comprising the display. Lord Roberts, Lolah, the handsome King Alfred, the white Peter Barr, Titius,

FIG. 61.—*ODONTOGLOSSUM CRISPUM DREADNOUGHT*.
(R.H.S. Preliminary Commendation, April 24, 1917.)

philaea cyanocrocus, and *Bongardia Rauwolfii*, a monotypic genus of the Berberideae, with glaucous stems and compound leaves, striped with chocolate brown; the yellow flowers are not unlike those of *Cheidonium majus*. Messrs. R. TUCKER AND SONS showed some charming Alpine gems in *Androsace pyrenaica*, *A. ciliata*, and *Primulas*. Alpines were also well shown by Messrs. J. IDEAL AND SONS, the Misses HOPKINS, Mr. G. W. MILLER, and Messrs. JOHN WATERER, SONS AND CRISP, whose *Saxifraga Rocheliana* and *Primula Crispii* with large rosy-purple blooms, were especially fine.

Floral Committee.

Present: Messrs. H. B. May (chairman), W. J. Bean, J. Green, G. Reuthe, G. Harrow, J. Heal, E. F. Hazelton, J. W. Moorman, T. Stevenson, W. Howe, J. Jennings, R. Hooper

MEDAL AWARDS.

The following medals were awarded to groups: *Silver Flora Medals* to Messrs. W. CUTBUSH AND SON, Highgate, for forced shrubs and Alpines; Mr. E. HUGHES, Teyford, for Roses. *Silver Pansian Medals* to Messrs. ALLWOOD BROS., Weydsfield, for Perpetual-flowering Carnations; Messrs. B. R. CANT AND SONS, Colchester, for Roses; Messrs. STUART LOW AND CO., Enfield, for Perpetual-flowering Carnations and Acaecias; Messrs. H. B. MAY AND SONS, Edmonton, for Ferns. *Bronze Flora Medals* to Messrs. F. CANT AND CO., for Roses; Mr. G. W. MILLER, Wisbech, for hardy flowers; Mr. G. REUTHE, Keston, for Alpines. *Bronze Pansian Medals* to Messrs. H. CANNELL AND CO., Eynsford, for Pelargoniums; Misses HOPKINS, Shepperton, for hardy plants; Messrs. WATERER, SONS AND CRISP, LTD., Twyford, for Alpines.

Cleopatra, a new Australian seedling named The King, after the style of King Alfred, with three new yellow varieties named Michael, Nebius, and Pinneas respectively, were among the best trumpets. Brilliant small-cupped sorts were Firebrand, Jasper, Furnace, and Blazing Star.

Messrs. DOBBIE AND Co., Edinburgh, put up a delightful group of Tulips consisting of Cottage, Darwin, and other late-flowering sorts. The flowers had all been grown under glass, and although another three days' growth would have improved them so far as size is concerned they were in just the condition purchasers love to buy their blooms. Silver-gilt Banksian Medal.

Fruit and Vegetable Committee.

Present. Messrs. J. Cheal (in the chair), E. A. Banyard, W. W. Jks., F. Perkins, J. G. Weston, H. Markham, J. Allrove, Geo. Kell, E. Beckett, A. Bullock, A. R. Allan, P. C. M. Vetch, W. H. Divers and W. E. Humphreys.

The only exhibit before this Committee was a collection of desiccated vegetables, shown by the ALLIANCE VEGETABLE COMPANY, LTD., 52, New Broad Street, London.

Potatoes, Carrots, Onions, Spinach, Parsnips, Beet, Swede Turnips, Cabbage, Sage, Parsley, and Celery tops were exhibited in the dried form, with specimens soaked ready for boiling. The Committee awarded a Silver-gilt Knightian Medal, and expressed a wish to see cooked samples at the next meeting.

NATIONAL AURICULA AND PRIMULA (Southern Section)

APRIL 23. The annual exhibition of this society was held in the London Scottish Drill Hall, Buckingham Gate, in conjunction with the R.H.S. fortnightly meeting. The exhibition was much smaller than usual, Miss LOWENSKY, Mr. BENNETT POLE, and Messrs PHILLIPS and TAYLOR being the chief contributors. Miss LOWENSKY, Titonhurst, Sunninghill, Berkshire, was awarded the James Douglas Memorial Challenge Cup offered for the best six varieties of Auriculas in Class 2. Miss LOWENSKY showed, among others, Acme, Mrs. Phillips, Harrison Weir, and Buttercup. The same exhibitor also won 2nd Prizes for (a) 4 Auriculas, dissimilar, and (b) 6 Alpine Auriculas, dissimilar, and 1 Alpine Auricula, dissimilar. She showed the best Alpine Auricula with white or cream centre, the variety being Mrs. Douglas and Mr. BENNETT POLE was second in this class with the same variety. Mr. BENNETT POLE's chief successes were in the classes for (a) single specimen of self-coloured variety, in which he showed a very good plant of Harrison Weir, (b) 6 Alpine Auriculas, dissimilar, stamens Argus, Dean Hole, Mrs. Douglas, Teviotdale, Rose Mount, and Phyllis Douglas, (c) 4 Alpine Auriculas, dissimilar, with Dean Hole, Teviotdale, Argus, and Mrs. Douglas. This latter was adjudged the best premier Alpine Auricula in the show. Mr. H. W. MASON, Binstead, Surrey, was awarded the 1st Prize in the class for 6 Alpine Auriculas, open only to amateurs. His best plants were King George and Commander.

Mr. G. W. MILLER, Wisbech, had the field all to himself in the classes for Primulas and Polyanthes; he was awarded the 1st Prize in six classes. His pans of double Primroses were exceedingly choice. Mr. JAMES DOUGLAS, Eden side, Great Bookham, staged a non-competitive exhibit of choice Auriculas, and Messrs. PHILLIPS and TAYLOR, Bracknell, showed a group of Alpine varieties.

HAYWARDS HEATH HORTICULTURAL.

APRIL 5. At the annual general meeting of the above Society, Mr. H. M. Knight presided over a good attendance of members. Mr. Plummer presented the financial report, which showed a balance in hand of £23 5s. 10d. The accounts were adopted. Colonel Stephenson R. Charle, C.B., J.P., was re-elected president, Mr. H. Plummer hon. treasurer, and Mr. G. Prevett hon. secretary. Mr. Prevett stated that the Society undertook to cultivate the gardens and allotments of soldiers on service. The number had gone up to 140. Of that num-

ber, 120 had been dug. The members of the local Volunteer force, who had assisted in the work, had dug between 70 and 80 gardens, and the rest had been done by private gardeners. The chairman announced that there would be no show this year, and the meeting then went into committee to discuss further the question of the upkeep of the soldiers' gardens.

Obituary.

HENRY HEATH.—We regret to announce the death of Mr. Henry Heath, formerly nurseryman and florist of Covent Garden, at his residence "The Elm," Oakthorpe Road, Palmer's Green. Deceased, who was in his 78th year, retired from business some ten years ago, and was succeeded by his son Henry, of Barkwell Green, Wincote Hill. The funeral took place at Old Edmonton Churchyard on Friday, the 27th inst.

C. WANT.—We regret to record the death, on the 16th inst., of Mr. C. Want, for twenty-eight years gardener at Clare Lawn, East Sheen. A native of Leatherhead, Surrey, he was in early life connected with the celebrated "Downside" collection of Orchids. Before going to Clare Lawn in 1889, he was employed at Gayton's Grove, Leatherhead. He leaves a widow and only son.

THE APIARY.

By CHLOEIA.

[WATER.—I would impress on bee keepers the need of providing pure water for the bees. I have found a difficulty in inducing bees to utilise that provided. In apiaries I have visited the following plan has been adopted. Take a vessel of cold water and drop on it a few drops of melted wax, the scent of which attracts the bees, and the flakes will provide floats on which the bees can rest to take in a supply of water. Another precaution, which appeared to me, was to place a sheet of glass well above the water to prevent the excitement of flying bees from falling into the water, which should be kept as pure as possible. It is most to be aware by now that the danger of Isle of Wight disease arises from the spores of *Nosema apis* being in the excitement. It is asserted that the glass allows the sun's rays to warm the water, and thus a further inducement for the bees to make increasing use of the water so provided. Of course, this all implies that all other sources of water must be banished from the vicinity of the hives, all empty vessels, tins, etc., which might catch rain water and so become contaminated.

CROPS AND STOCK ON THE HOME FARM.

BUCKWHEAT

Now that there is a prospect of a shortage of ordinary food for fowls, it behooves all who keep them to strive their utmost to grow substitutes.

The common Buckwheat (*Polygonum Fagopyrum*) is a plant that might be employed with advantage. In the past Buckwheat was mainly grown in odd corners of fields, situated on the margin of woods as an encouragement to pheasants, and not as a crop to harvest. The common Buckwheat is an annual plant, with smooth, pinkish stems which grow to a height of 2 feet. The flowers grow in crowded panicles. Each flower possesses five pinkish white sepals, eight stamens, and an ovary, which, when ripe, forms a dark-brown nut similar in shape to, but smaller than, a Beech Nut.

The grain is extensively employed as poultry food, and a little is sometimes mixed with oats for horses.

As a honey plant for bees, Buckwheat is excellent, the flowers lasting over a considerable period.

Ploughed in green like Mustard, Buckwheat adds humus to the soil. The plant cannot with stand frost either in the spring or autumn, and seed should not be sown before the middle of May. Cold, sunless weather is against rapid

growth, and consequently against the production of seed.

Light, sandy, or chalk soils are more favourable to growth, being warmer than heavier, colder ground.

Too much manure induces rampant growth at the expense of seed, and also renders the plant more easily injured by frost. On a warm plain, with a moderate amount of manure and good tilth at no-time, one bushel of seed per acre drilled shallow will, in a good season, produce four quarters of seed per acre. The end of August or the early part of September is a reasonable time to expect the bulk of the crop to be ripe. As the plant continues to grow until frost checks its progress, it is useless to expect all the seed to ripen, therefore it is wise to cut early and secure the best seed. *E. Molyneux.*

CORN PRODUCTION.

The Bill which Mr. Prothero introduced to the House of Commons on Wednesday, April 25, has for its immediate object the raising at home of a large proportion—if possible so large as 82 per cent.—of the food required by the people of these islands.

It is difficult to believe that anybody who is living through the experiences of the present can doubt not only the desirability, but the sharp necessity for doing everything that can be done to secure this end. And this, not only because of the present somewhat menacing outlook, but also on the permanent interests of the nation.

The prime means whereby Mr. Prothero proposes to accomplish this increased production of Corn are by giving a guarantee with respect to minimum prices and by fixing a minimum wage for agricultural labour.

The increased production is to be brought about by the breaking up of grass land, of which it is estimated that eight million acres will have to be added to the present area.

Even with a total of twenty seven million acres of arable land there would be only three-fifths of the area of the country under the plough, as against two-thirds in France and one-tenth in Denmark.

In spite of labour, climatic, and other difficulties, 500,000 additional acres in England and Wales, and 700,000 acres in Ireland have already been converted into arable land, and the programme which the Board of Agriculture has set for itself is to secure that each county shall increase its arable in due proportion, so that, if possible, in two years hence three million acres may be added to the land under the plough.

Small cultivators are to contribute towards the 13 per cent necessary to complete the supply of home grown food, and we believe that if sufficient facilities are given to them they will be able to do this.

If, out of the casual and somewhat chaotic conditions with respect to agriculture which prevailed before the war a vigorous, defined and practical policy for the colonisation of those islands were to emerge, something, and something worth while, would have happened to compensate in some measure for the waste of the war.

CENSUS OF HORSES, LIVE STOCK, AND AGRICULTURAL MACHINERY.

A CENSUS of horses and mules, and a census of cattle, sheep, pigs and agricultural machinery in Great Britain on April 21, 1917, are to be taken at the end of this month, in connection with the measures necessary for obtaining horses for the Army, for increasing the production and economising the use of grain, and for conserving food supplies (particularly meat and milk).

Orders have been made under the Defence of the Realm Regulations making it compulsory on every person who owns any horses or mules, or any cattle, sheep, pigs or agricultural machinery, to make a return, by May 1 at the latest, on forms which have been prescribed for the purpose and are to be obtained from any police station—a buff form for the census of horses and mules and a white form for the census of cattle, sheep, pigs, and agricultural machinery. Every owner of any of the animals or machinery in question should take care to provide himself with a form (if he has not received one from the police) in time to have his return ready by the end of the month.

MARKETS.

COVENT GARDEN, April 25.

Cut Flowers, &c.: Average Wholesale Prices.

Anemone fulgens, s.d.s.d. per doz. bun. 2.0-2.6	Peas, white and coloured, per doz. bun. 6.0-12.0
Azalea, white, per doz. bun. 4.6-5.0	Pelargoniums, per doz. bunches, double scarlet 6.0-8.0
Camellias, white per doz. blms. 1.6-2.0	Primroses, per doz. bun. 1.6-2.0
Carnations, per doz. blooms, best American varieties 2.0-3.0	Roses - General Jacquemont, per doz. blooms 1.6-2.0
Carlia (Cormson), ex. large 3.6-4.0	Joseph Lows, per doz. blms. 2.6-3.0
Daffodils, Golden Spur, per doz. bun. 1.6-2.0	Lady Hillingdon, per doz. blms. 1.6-2.6
Barri, per doz. bun. 1.6-2.0	Liberty, per doz. blooms 3.0-4.0
Emperor, per doz. bun. 2.0-3.0	Melody, per doz. blooms 3.6-4.0
Princes, per doz. bun. 1.3-1.6	Mme. A. Chateaux, per doz. blooms 3.0-4.0
Sir Watkin, per doz. bun. 2.6-3.0	Mme. Edouard Herriot, per doz. blooms 2.6-3.0
Victoria, per doz. bun. 2.6-3.0	Opelia, per doz. blooms 3.0-5.0
Forget-Me-Not, per doz. bun. 6.0-8.0	Prince de Bulgarie, per doz. blms. 3.0-3.6
Freesia, per doz. bun. 1.6-2.0	Richmond, per doz. blms. 2.6-3.6
Heather, white, per doz. bun. 12.0-16.0	Sunburst, per doz. blms. 2.6-3.6

Lily of the Valley, long, per doz. 1.6-2.0	Stephanotis, per 72 pins 3.0-3.6
short, per doz. 3.0-3.6	Tulips, white, per doz. bun. 14.0-24.0
Lanatifolium album, long, 2.6-4.0	yellow, per doz. bun. 12.0-18.0
short, 1.6-2.0	Darwin in variety, per doz. bun. 21.0-24.0
Lily of the Valley, per doz. bun. 24.0-30.0	Princess of Wales, single, per doz. 3.0-5.0
Narcissus, Grand Primo, per doz. bun. 1.6-2.0	
Pheasant Eye, per doz. bun. 2.0-3.0	
Orchids, per doz.: Cattleya, 12.0-15.0	
Odontoglossum, 3.0-4.0	

REMARKS.—Cut flowers are now more plentiful, and prices are considerably lower throughout the market. This week very large quantities are being received from the Channel Islands. Daffodils and White Narcissus are offered at very low prices. There is also an abundant supply of home-grown Daffodils. Roses are cheaper, and some exceptionally fine blooms of the following varieties are on sale:—Mme. Abel Chatenay, Mme. Edouard Herriot, White Molly Sherman Crawford, Melody, Lady Hillingdon, Prince de Bulgarie, President Carnot, Opelia, Sunburst, Liberty, and Richmond. Sweet Peas are increasing in quantity. Some fine bunches of white, pink, and mauve flowers are being received from our own growers, and a few boxes from Guernsey. French flowers are finishing, owing to the warmer weather. Owing to delay, many baskets are received here in an undesirable condition. Spanish Iris is also making its appearance, and a few bunches of blue are being sold at 5s. per doz. blooms.

Vegetables: Average Wholesale Prices.

Artichokes, Globe, s.d.s.d. per doz. 5.0-7.0	Kale, per doz. 10.0
Jerusalem, 4.0-6.0	Leeks, per bag, 3.6-5.6

Horseradish, per doz. 66.0-72.0	Seakale, per doz. punnets 3.0-3.0-29.0
	Shallots, per lb. 0.6-10.0
	Spinach, per bus. 5.0
	Swedes, per ton 50.0-90.0
	Turnips, per cwt. 10.0
	Tops, per bag 14.0
	Vegetable Marrows, per doz. 8.0-12.0
	Watercress, per doz. 0.8-0.9

Fruit: Average Wholesale Prices.

Almonds, per cwt. 80.0-85.0	Grapes—con. s.d.s.d. - English (new season) Hambro, per lb. 6.0-8.0
Apples - English Cooking, per bus. 20.0	Lemons, per case 25.0-40.0
French, per case 22.0-24.0	Nuts, Brazil, new, per cwt. 95.0-100.0
Bananas, Jamaica, per ton 122.0	Cocoanuts, per 100 31.0-32.0
Cranberries, per cask 11.0-12.0	Oranges, per case 40.0-70.0
Dates, per doz. boxes 7.0-8.6	Peaches, per doz. 21.0-24.0
Figs (Worthing), per doz. 15.0-24.0	Pears - Californian 16.0-20.0
Grapes: Almeria, per doz. lb. 10.0-15.0	Strawberries, forced, 6.0-10.0
	Tomatoes, English, per lb. 2.6-3.0
	Walnuts, per cwt. 65.0-85.0

REMARKS.—Apples continue to be limited in supply. A shipment of Australian fruits is now due. The first of the new English crop of Black Hamburg Grapes is to hand this week, and Figs and Peaches are also available. Supplies of morning gathered Strawberries are increasing daily. The forced vegetables now obtainable are Peas, Beans, Cucumbers, Asparagus, Seakale, Vegetable Marrows, Tomatoes, and new Potatoes. French salads are plentiful, but all varieties of green vegetables are, as usual at this season, scarce. E. H. R., Covent Garden Market, April 25, 1917.

ANSWERS TO CORRESPONDENTS.

BOOKS.—Correspondent. Forbes and Hemsley's *Enumeration of Chinese Plants* is out of print, and can only be obtained second-hand. You might be able to get a copy from John Wheldon and Co., 58, Great Queen Street, W.C. The list was published in the *Linnean Society's Journal*, vol. 23, etc. *Plantula Wilsoniana* may be obtained from our publishing department. It consists of nine parts, price 12s. 6d. each part.

MAIZE, OR SWEET CORN: F. W. C. The heads of Maize, known as Sweet Corn, form a deli-

FIG. 62. BLACK AND CLAY COLOURED WEEVILS.

icious vegetable. Unfortunately it is a some what precarious crop in this country, and grown in the ordinary way during a wet or dull and sunless summer is of little use, but it is worth a little extra trouble in order to overcome these difficulties. The seed should be grown in gentle warmth in boxes during April, the seedlings potted, and finally planted out in frames, on an old hotbed for choice, in a sunny position, treating the plants in much the same way as for Vegetable Marrows; gradually harden the plants, and finally remove the lights entirely towards the end of May. Plenty of water is essential during spells of dry weather. Spare plants may be planted in well prepared ground, in a sunny position, from the middle to the end of May, and if these are potted up and encouraged to make strong plants before putting them out, so much the better. The cobs are fit for table in a green state before the seeds commence to harden. As well as being useful as a vegetable all the varieties of Indian Corn are extremely ornamental.

NAMES OF PLANTS: *Shirehampton*, *Aureone Hepatica*, double pink variety. The species is commonly known as *Hepatica triloba* in gardens.—*J. H. L.* 1. *Odontoglossum Wilkeanum* (crispum × luteo-purpureum); a very good form. It may be either an imported natural hybrid, or home-raised; 2. *Odontoglossum gloriosum*; 3 and 5, forms of *Cypripedium Lawrenceanum*; 4, *Cypripedium barbatum nigrum*; 6, *Cypripedium conspicuum* (villosum × Harrisianum).

NUTS: F. T. The nuts are the seeds of *Lecythis Zabucajo*, and are sold in shops as *Sapirata nuts*. The tree grows to a great height, and is mostly found in Brazil, the principal source of the seeds being Para.

SCALE INSECTS ON PEACH TREE: M. M. Sponge the plants with weak paraffin emulsion. Dissolve one ounce of soft soap in a pint of boiling water, and whilst it is still boiling hot pour the mixture into two pints of paraffin and churn until a creamy fluid is obtained. Use one part of the emulsion to 50 or 60 parts of water. Next winter treat the trees with a caustic alkali wash, using a brush to remove the scale. Syringing the trees when dormant with water at a temperature of 145° is also effective.

SLOW GERMINATION OF VEGETABLE SEEDS: E. H. R. If the Onion and Carrot seeds were sown they should germinate satisfactorily even though a long time has elapsed since they were sown. These vegetables take much longer to germinate than the others mentioned. Woodlice would not affect them. The best way to destroy wood lice is to pour boiling water on their haunts.

WEEK WITH A BULB: M. L. Y.—We think you have made a mistake in calling your weed *Sheep's Sorrel* (*Rumex acetosella*). That plant does come into the garden occasionally, but is easy to eradicate. Wet, cold, poor, and sour soils are those where it appears in thousands, and is most at home. In such places it can be gradually eradicated by draining and liming the soil to counteract its sourness. You state that your plant has a bulb, which points to it being an *Oxalis* or *Wood Sorrel*. Several of the South African species have become a nuisance in this country—some in greenhouses and others outdoors. *O. corniculata* maintains itself out-of-doors in gardens in any part of the country, but it is not bulbous, being the only South African species that is fibrous rooted, maintaining itself by seeds. A notorious bulbous one is *O. cernua*, with yellow flowers; but some others are quite as bad in the borders of greenhouses, not outdoors. They seldom flower, but increase rapidly by means of bulbs, and digging merely disperses them more widely. Gaslime, at the rate of 1 pound to the square yard, is the most likely agent to kill the bulbs. It should be applied in autumn when the border is empty. When the plant comes into full leaf early in summer you can dust the foliage with sulphate of ammonia, not exceeding 1 ounce to the square yard, while other plants occupy the border. A third part of common salt mixed with it would make it more effective. Both these salts should be perfectly dry and powdery when used, and should be dusted only on the foliage, as far as possible. The bulbs will most likely throw up fresh foliage, but repeat the treatment each time this occurs, preferably in dry weather, and during the early part of the season, when rain is not so prevalent as in the autumn. The object of this is to exhaust the reserve food in the bulbs. Pea-flowered or Leguminous plants should not be grown in the border whilst these salts are being used.

WEEVILS ON ROSES: J. G. L. The insects attacking your Roses are clay-coloured weevils, *Otiorynchus picipes* (see fig. 62). Your method of catching them at night is the best one to pursue. They drop from the plants on being suddenly disturbed, and especially if a bright light is flashed amongst them. By spreading a white cloth beneath the plants you would be able to trap the creatures easily, or sheets of paper smeared with a sticky substance might be used instead of the white cloth. Another method of killing the insects is to fumigate the house late at night with hydrocyanic acid gas.

In these days, when every firm has to advertise or see its business decline, it is necessary to make sure that the needed publicity is so obtained that the results justify the expenditure.

The Gardeners' Chronicle

SCALE OF CHARGES FOR ADVERTISEMENTS.

Advertisements intended for insertion in the next issue MUST reach THE PUBLISHER not later than WEDNESDAY, 5 p.m.

Table with 2 columns: Description of ad types (Ordinary Postions, Facing matter and Back Page, Half and quarter pages, etc.) and Rates (per page, per inch, etc.).

Front page (no display allowed) 1/- per line space (Headline counted as two lines)

For discounts apply to address below.

SITUATIONS WANTED.

2/- words 7s. 6d., and 6d. for every additional 8 words

These Advertisements must be prepaid, AND APPLY ONLY TO GARDENERS, &c., OUT OF EMPLOYMENT.

SUBSCRIPTIONS.

Table with 2 columns: Location (THE UNITED KINGDOM, ABROAD) and Rate (15/- per annum, 17/6 ..).

Cheques and P.O.s only made payable to "GARDENERS' CHRONICLE," LTD.

41, WELLINGTON STREET, COVENT GARDEN, LONDON, W.C. 2.

Telegrams: 1543 "GARDENERS," RASD, LONDON." Telephone: 1543 GERRARD.

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line

Gardeners desiring their Advertisements repeated must give full particulars, otherwise no notice will be taken of their communications.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. On no account should they enter into communication with unknown correspondents who require a fee beforehand.

Advertisers are cautioned against having Letters addressed to Intuits at Post-offices, as all Letters so addressed are opened by the Postal Authorities and returned to the Sender.

PRIVATE.

WANTED, HEAD WORKING GARDENER (single-handed), thoroughly experienced. Vegetables, outdoor Fruit, and small home farm.

WANTED, GARDENER (single-handed), thoroughly experienced. Vegetables, outdoor Fruit, and small home farm.

WANTED, practical SINGLE-HANDED GARDENER for Ripon, some help given. Apply with particulars and wages required, with reference, to C. H. WHEELER, Swinton Gardens, Masham, Ripon.

WANTED, GARDENER, for Berks, who is willing to learn and manage electric engine; cottage found. Apply, first instance, to MR BILLMOORE, Cavesham, Reading.

WANTED, GARDENER or LADY GARDENER.

THOROUGH home for Vegetable GARDENER who understands poultry, live in; good wages, good food. 67, Wigmore Street, London, W.

WANTED, IMPROVER, Inside and Out; age 15 to 16, wages 18s. 6d. only, vegetables, milk. -E. MORGAN, Wessand Hall Gardens, Hull.

WANTED, several YOUTHS, 16 to 17; Inside and Out, wages 18s. per week, Bath, &c.; Sunday duty and overtime paid. 1 o'clock Saturdays; travelling expenses paid.-C. GARRATT, Canwell Hall Gardens, Sutton Coldfield, Birmingham.

WANTED, LADY GARDENER, for Glass Department. State age, experience, wages required, to GEO. W. HADON, Burwalls, Leigh Woods, Bristol.

WANTED, a LADY GARDENER or experienced GARDENER (man) for duration of war; man at 1 hour kept, GENTLE LADY PENRYN, Hill Place, West Meon, Hampshire.

WANTED, at St. Leonards School for Girls, St. Andrews, Fife, a fully qualified and well-educated WOMAN, to act as HEAD GARDENER and INSTRUCTOR in GARDENING; knowledge of the growth and sale of Vegetables and the care of Grass is essential, and some experience in teaching desirable. -For further particulars apply to the HEAD MISTRESS.

EXPERIMENTAL and RESEARCH STAFFS, Chesham, Berks. Young lady required to assist in taking measurements and keeping records of crop production. Applicants must be accurate and reliable in their work. Previous experience in science is desirable but not essential. Hours, 7.30 am. to 5.30 pm. Apply to the Director, stating age, experience, wages required, enclosing a copy of one recent reference.

WANTED, LADY GARDENER, under another lady, all round experience. Apply to MRS. ROBINSON, Bellinch House, near Salisbury.

THE CONIFERS OF JAPAN.

THIS remarkable work on the Conifers and Taxodi of Japan,* lately published by the Arnold Arboretum, U.S.A., is the result of a year's travel in that country by the distinguished English botanist, Mr. E. H. Wilson, whose explorations of the Chinese flora are so well known to gardeners and foresters. Mr. Wilson has had the rare advantage of seeing in the wild state all the species which he describes. The plates, taken from photographs of the trees in their natural surroundings, add much to the interest of the book, which in addition to being a critical botanical study is replete with information on the habit and habitat, and on the economic and decorative uses of an important group of plants.

Wilson admits that eight species of indigenous Conifers in Japan, one of a pair of which are found wild outside of that country. The Ginkgo, now generally considered to belong to another order, is cultivated in Japan around temples, as it is also in China. Its occurrence in the wild state was until lately denied, but Frank N. Meyer, botanical explorer for the U.S. Department of Agriculture, states that it grows spontaneously in rich valleys over some ten square miles near Changhua Hsien, about 70 miles west of Hinghsien, in the Chekiang province, China, where the trees are so common that they are cut for firewood.† Wilson gives an interesting account of the five species of the order Taxaceae that occur in Japan, and mentions a magnificent tree of *Torreya nana* at Kano, in Satsuma province, which is 55 feet in height and 18 feet in girth. This species is readily distinguished from the Chinese *Torreya grandis* by the short, becoming reddish brown in the second and third years, whereas in the latter species they remain yellowish-green until they ultimately assume a greyish tint. In New England the Japanese Yew is the hardiest of all the species.

Six Pines are found wild in Japan, of which *Pinus pomila* is the most remarkable. It is creeping in habit, with one or several main stems which lie flat on the ground for 70 to 50 feet, emitting roots freely throughout their whole length, and sending up a tangled mass of lateral branches from 1 to 3 feet high. The other three white Pines of Japan, *P. Amamih* (native of

* *The Conifers and Taxodi of Japan.* By E. H. Wilson, pp. 34, 194, with 59 full-page illustrations. Issued December 31, 1916, as *Publications of the Arnold Arboretum*, No. 8, (Cambridge, Mass., U.S.A.)

the two Southern isles of Tanega and Yaku), *P. koraiensis*, and *P. parviflora*, are well known in cultivation in Europe. Wilson abolishes the *P. pentaphylla* of Mayr, which cannot be distinguished from *P. parviflora* even as a variety, and states that the dwarf specimens with short needles of the latter species owe their peculiar habit to the fact that they are grafted on *P. Thunbergii*, which stunts their growth. The two hard Pines of Japan are *P. densiflora*, the Eastern representative of the Scots Pine, which it resembles in its perpetually scaling reddish bark, and *P. Thunbergii*, the representative of the Austrian Pine. The latter has influenced Japanese art more than any other tree, and is a familiar object in paintings, wood carvings, and embroideries.

The Japanese Larch, styled *Larix Kaempferi* Sargent in this book, but best known as *L. leptolepis* Gordon, is the most important discovery that the East has yielded to European forestry. According to Wilson, it often grows in pure stands of considerable area, but is also found in mixed woods with other Conifers, and with broad-leaved trees like Oak, Beech, Hornbeam, and Birch. Its maximum size is about 110 feet in height and 17 feet in girth; but such trees are rare, the average being about 85 feet high and 6½ to 10 feet in girth. The wood is very durable, and is valued in Japan for use in ship-

Wilson recognises six species of Spruce in Japan, including the lately discovered *Picea Koyamai*, of which there are seedlings growing in the Arnold Arboretum. *P. bicolor*, of which two varieties have been described by Shirasawa, is certainly represented in England by two distinct forms, one of which, however, has not produced cones. Wilson ignores these. The blue Spruce of Hondo, commonly cultivated in England, and distinguished by Mayr as *P. hondoensis*, is united by Wilson with the Continental *P. ajanensis*, the aggregate being known as *P. Jezevskensis*, Carrière. In cultivation in England, it will be advisable to keep up the two former names, until the seedlings of *P. ajanensis* assume the adult foliage and produce cones. The name *P. Aleoekiana* must be discarded, as being based on mixed material of two species. The Japanese Douglas Fir (*Pseudotsuga japonica*) is an extremely rare tree, very distinct from the Oregon species in its moderate size and slow growth, rarely attaining 100 feet in height. The Formosan *Pseudotsuga Wilsoniana*, Hayata, seems to be identical with the rare Western Chinese *Pseudotsuga sinensis*, Dode, of which there were seedlings growing in 1913 in Chennault's nursery, Orleans.

Wilson recognises five Silver Firs in Japan, and adopts the name *Abies homolepis* for the species ordinarily known in England as *A.*

FIG. 62. PINUS POMILA.

building and for jet-ports, railway sleepers, and telegraph poles. It is extensively planted, not only in the main island, where it is indigenous, but also in Holland, where no species of Larch occurs in the wild state. Wilson makes the important observation that the scrubby form (var. *Murrayana*, Maximowicz) growing at high elevations (5,000 to 9,500 feet) on Fuji-san is the direct result of local ecological conditions, and is not of a hybrid character, as proved by the plants growing in the Arnold Arboretum. Seeds were collected in 1872 at the upper limit of the scrubby Larch, and trees raised from them are now 40 feet high, having grown as rapidly as trees raised from seeds collected from the ordinary form at low elevations. This experiment requires fuller confirmation, as it contradicts the results obtained at Swiss and German experimental stations, where seeds of various Conifers from high and low elevations were sown. *Larix koraiensis*, with pubescent, reddish shoots, occurring in Sighalien and Kurile Islands, is regarded by Wilson as a variety of *Larix dalmanica*, native of the mainland in Korea, Manchuria, and Northern China; but the structure of the leaves and cones appears to be distinct. Moreover, as grown at Kew, the habit of true *L. dalmanica* and *L. koraiensis* is strikingly different, the appearance of the latter being quite unlike that of any other species.

brachyphylla. He considers *A. umbellata* Mayr to be a variety with green cones, but there is a possibility that this tree is a hybrid between *A. firma* and *A. homolepis*. The latter is the finest of the Silver Firs in Japan, attaining about 120 feet in height and 20 feet in girth.

Perhaps one of the most interesting parts of the book is the graphic description of the famous forest in the southern island of Yakushima, where *Cryptomeria japonica* is dominant, growing in a mild climate, from sea level to 6,000 feet, in a rich soil with abundant rainfall. The wood is highly valued, selling in Japan at fancy prices. It is fragrant, pale brown in colour, often beautifully spotted and figured, and much prized for house-decoration and furniture-making. The wood is extremely durable, trees felled 20 years ago lying quite sound on the floor of the forest. *Cryptomeria* is much planted in Japan from the extreme south to the north of Hondo. It takes root readily from cuttings, branches as thick as the third finger, and from 12 to 20 inches long, being put in the ground close together during late autumn, winter, and early spring, according to climate, and in time these grow up and form new forests. Seeds produce better and more quickly growing trees, but the initial cost is greater than by using cuttings. *Cryptomeria* does not quite rival in size its close allies, the two *Sequoias* of Cali-

FIG. 63.—NORMAL BLOSSOM OF BLACK CURRANT.

forma, but immense trees occur, those in the famous avenue on Koyasan being 200 feet high and 20 feet in girth, and about 650 years old.

Thuopsis dolabrata, of South Japan, is a small tree, but the northern form, var. *Honda*, with larger cones, attains a height of 110 feet. The Japanese *Thuja* rarely exceeds 50 feet in height, but, as seen in a few rare examples in England, is very handsome and distinct. Of the two Japanese Cypressess, *Cupressus obtusa* is the more valuable, as the wood is more esteemed than that of any other Conifer by the Japanese, who use it largely in afforestation work, but only on the best sites.

Of the *Junipers* in Japan Wilson recognises five species, reducing to a variety of *J. communis* the peculiar Alpine shrub distinguished by *Matsumura* as *J. nipponica*. *J. chinensis*, var. *Sargentii*, is a very peculiar vigorous variety, remarkable for its long spreading stems, which hug the ground. It was introduced in 1892 into the Arnold Arboretum, where it has proved perfectly hardy, and is used for forming neat, low, wide-spreading masses of green foliage close on the soil.

These few notes will show the interesting character of this handsome volume, which is full of information valuable alike to the gardener and to the forester. *J. Henry*

ABNORMAL BLOSSOM ON BLACK CURRANT.

THE Black Currant variety plots at the Wye College Fruit Experiment Station, East Malling, have now been under observation for two seasons. The observations are yielding many useful facts; but perhaps one of the most interesting is the appearance of abnormal blossom. Several plots, notably the North Holland Black and the Lee's Prolific plots, early showed signs of so-called "reversion" or "nettlehead"; but until 1916 all these bushes continued to set some fruit. In the spring of 1916 it became obvious that one bush of Lee's Prolific was conspicuously "nettle-headed"; this was quite apparent early in May, and the bush was kept under observation from that time. During a general examination of blossoms, abnormal trusses were noticed on the bush in question, and on May 24 the inflorescence was described and photographed. The following is the description:—The fruiting spurs of the abnormal inflorescence consist of one or more single blossoms each on a short pedicel (stalk), together with several racemes (trusses of flowers). The abnormal condition of the blossoms differed in the two instances.

The single blossoms were below normal size. A single whorl of irregular spatuloid leaves, reddish

in colour, took the place of petals and sepals, but originated around the base of a superior ovary; in the normal flower, it will be remembered, the ovary is inferior. The pistil was apparent, and there were signs of rudimentary stamens. The ovary was found to be full of ovules, but the blossoms failed to set fruit.

In the case of the racemes, the flowers were not nearly so far developed. On first appearance, as is shown in the illustration (fig. 65), they looked like small unopened buds. A close examination showed that there arose from the peduncle (main stalk), instead of a number of single blossoms, as normally each on its own pedicel, a number of what appeared to be minute buds (often four or five) on each pedicel. These "buds" were almost obscured by numerous threadlike bracts, in the axils of which they were produced; but the buds and bracts were so compact on each pedicel as to give to the naked eye the impression of a single flower bud in an early stage of development. These "buds" were dark brown in colour as if dead.

Both types of abnormal blossom appeared on each "spur," and were fairly frequent over the whole bush, which showed no normal flowers and set no fruit. The blossoms shrivelled up and remained hanging on the bush through the winter, just as the normal stalk often hangs if

FIG. 65.—ABNORMAL BLOSSOM OF BLACK CURRANT LEE'S PROLIFIC. A SINGLE FLOWER WITH SUPERIOR OVARY IS SHOWN AT X.

FIG. 64.—REVERTED BRANCH OF BLACK CURRANT LEE'S PROLIFIC SHOWING THE NETTLE-HEADED LIKE GROWTH AND ABNORMAL TRUSSES OF BLOSSOMS AT THE SPURS

the fruit has dropped off. The bush in question showed no visible sign of "big bud," but was very "nettle-headed." A single "big bud" is now apparent.

Other bushes which had been marked as showing the earlier stages of "reversion" were examined for this abnormal blossom, but none was found. All these bushes had some normal flowers and set some fruit.

It is therefore impossible at present definitely to connect this abnormal blossom with "reversion," and more detailed observations will be made this year. However, it would be

useful to know whether growers of Black Currants have observed these abnormal flowers at all generally, and, if so, whether they have noticed them upon "reverted" bushes. As the blossoming season is at hand, any reliable evidence would be most helpful. If these abnormal blossoms should prove at all common upon "reverted" Black Currants at the stage when they cease fruiting altogether, such information might be of use in discovering the real cause of "reversion." It seems likely that though the condition called "nettle-headed" may be caused by injury to terminal buds, by "big bud," and the "Capped Bud," where "reversion" leads to complete sterility some defect in the flower is to be looked for. *R. G. Hutton and J. Amos.*

TREES AND SHRUBS.

SHRUBS DAMAGED BY FROST

MANY *Azaleas* and *Crimodendrons* in these gardens have been killed by the frost, whilst certain *Rhododendrons*, *Azaleas* of the *Hexa* variety, and some plants of *A. amurensis* have been badly injured. *Abutilon vitifolium* I thought was dead, but I find that growth is breaking from the hard wood. The *Azaleas* have been badly crippled, as have also *Ceanothuses*. Some *Ericas*, including *E. lusitanica*, have been killed, whilst others are in full bloom, quite unharmed. These remarks also apply to *Olearias*. Plants of *Eucalyptus* have been cut to the ground level. *Avicaria retinoides* has been killed outright. *Rhododendron ciliatum* has lost all its flower trusses on some bushes, while others are now showing flower. *Veronica Hulkeana*, though very badly injured, is breaking into growth from the hard wood. A handsome plant of *Berberidopsis corallina* has been killed outright. *W. A. Cook, Abbot's Wood Gardens, Godalming, Surrey.*

SAXIFRAGA APICULATA VAR. ALBA.

S. APICULATA is a well-known early-flowering species which has been grown under various names, including *scardica* and *Malyi*. It is evidently a hybrid between *S. sancta* and *S. Roeheliana*. The influence of the latter parent is partly proved by the appearance some seven years ago in three or more different gardens of

the white variety (see fig. 66) amongst patches of the yellow *apiculata*. The albino is a free-growing, floriferous plant of the same habit as the type, the pure white flowers being produced in loose heads of three or four. Both forms are valuable for the rock garden, where they look best planted in rock crevices, although they do equally well on flat ledges. *S. apiculata* is also suitable for pot cultivation; specimens flower very early in an Alpine house and last for a long time in bloom. *W. L.*

ON INCREASED FOOD PRODUCTION.

PLANTING POTATOS.

I HAVE always planted all varieties of Potatos in rows, two feet apart, and at a distance of one foot between the sets. At Bletchley Castle gardens last year the variety Evergood grew thirty-three and a half inches in height, and was a perfect thicket of stems all over the plot, yet the result when lifted was 22 tons 2 cwt. of ware and seed per acre, and 4 tons 7 cwt. of small tubers. I do not consider this would have been exceeded by wider planting. No disease attacked the tubers; although other varieties near it were able to do the maximum growth made by the tops in 24 hours was 2½ inches. Factor, a variety which produces only a moderate amount of haulm, growing by the side of Evergood gave 11 tons 6 cwt. 3 qrs. per acre of ware and seed, and 2 tons 3 cwt. of small tubers; also 1 ton 8 cwt. diseased tubers of various sizes. This gave a total of 14 tons 11 cwt. 7 qrs. per acre against 26 tons 9 cwt. of the more generally growing variety. The plants were grown in strong soil overlying lias clay, and were given every encouragement in the way of cultivation and manure; it should be noted that Evergood is not of first-rate quality when cooked. Experiments made at Ketton Hall with various manures, some 25 or 30 years ago, gave 12 tons 2 cwt. of ware and seed, and one ton of small tubers per acre, as the highest yield. The crop was under field cultivation on a shallow soil—6 to 9 inches deep overlying oolite lime stone, the variety being Magnum Bonum. *W. H. Dimes.*

LAWNS AND THE FOOD PROBLEM.

IT would be interesting to know, when one visits a country, your own or abroad, Mr. Lovett, produced 30 lbs. of dried Beans from 1 lb. of seed, as stated on p. 166. Such statements appear somewhat outrageous to the world's food producer, and may result in the unnecessary waste of valuable land. My experience in this country in producing dried Beans as a source of food for winter use is that they are a very precarious crop, and nothing like so productive and adaptable to our climate as the Pea when grown and used for a similar purpose. *G. H. H. W.*

FOOD PRODUCTION BY SCHOOL CHILDREN.

At Abergavenny, in Wales, 24 acres of land have been rented and laid out in narrow rows for Potatos. Nearly every child in the higher departments of the public elementary schools has taken a row, paying 7s. in 28 weekly instalments of 5d. each to cover the expenses. The organisers of the scheme arrange for manuring, ploughing, moulching and haulage; while the children will be expected to set the Potatos, clear the rows before moulching, lift and peck the crop, and put it into bags. It will then be delivered at their homes. Some £100 rows have been taken, and it is hoped that about 120 tons of Potatos may be obtained from the 24 acres.

POTATO CROPS.

I HAVE grown Potatos in gardens with soil varying from almost pure sand to ground overlying the red sandstone, and as heavy as brick earth a foot or so under the surface. In all

cases I would be guided by the nature of the soil and the surroundings, as to the distances between the rows and sets. I have never planted late or main crop Potatos in the garden, but relegated them to the field. Even where we had 11 acres inside the garden walls and more ground outside, those planted in that garden were first and second earlies, not mid season ones, if I may be allowed to use the expression. When Sutton's Magnum Bonum was first sent out as a strong-growing white kidney, suitable for field cultivation, we planted it in the fields on the home farm, with good results. I have dissuaded hundreds of would-be planters from growing main crop Potatos in gardens, and particularly those who desire to plant them 3 feet apart and then plant a row of Brussels Sprouts or some other member of the Brassica tribe between them. Mr. E. Beckett (p. 171) in advocating a space of 3 feet by 20 inches for all main crop varieties must refer to rich and deeply cultivated soils. If he refers to field culting the land in his district must be in very fine condition indeed, otherwise the Potatos would never cover the ground. I have been observing the Potato

A powerful foreign engine is arranged to pull, not a plough, but the draining tool. This consists of a round steel plug about 3 inches in diameter. It is fixed to the bottom of a strong coupler or knife, the top of which is attached to a frame mounted on wheels. When pulled by the engine or its wire rope, the frame runs along on its wheels, the coupler makes a cut in the soil, and the steel plug, two feet or so below the surface, is dragged through the solid clay, leaving an open 3 inch channel behind it. The cut made by the coupler soon closes up, but the 3 in hole remains, and makes an effective drain something like a mole run. It will last for 10 to 20 years.

The mole drains may be laid seven or eight yards apart, but if the land lies in ridge and furrow, the drains must follow the lines of the furrows. It is usual to form the main drain of the field with pipes, and let the mole drains run into them. But, if necessary, for the time being, the main can be made a mole drain also, or the small drains run straight into a ditch, so that pipes can be dispensed with altogether till peace returns. Before the war, the cost of mole

FIG. 66. SAXIFRAGA APICULATA ALBA. (Photograph by C. P. Raffall.)

has not only to be plough in Middlesex and Surrey for many years past, and could not understand why they were so poor. Only within the last few years have I seen a satisfactory crop of Potatos in the field, and that was on chalk. The modern race of Potatos is of greatly increased vigour, and that may be beginning to tell in farm culture in the home counties. Mr. Beckett did not say how many stems he allows on his sets. That would have some bearing on the size of the tubers. *J. F.*

MOLE DRAINING.

FARMERS, whose land is heavy often lose by undrained fields, or fields where old drains have become choked. But pipes cannot now be obtained, and there is no labour to lay them if they could be got. In many cases, the trouble could be met by the cheap system of mole draining, as carried out in Essex and other south-eastern counties. To make mole drains a success, the subsoil must be a fairly stiff clay, with no big stones or pockets of gravel; it must neither be quite flat nor of irregular, hilly surface, and the work must be done when the top is dry and firm, and the subsoil moist, a condition often found in April and May.

draining was from 20s. to 25s. an acre, and this cost was often covered by the improvement in the crops of the first year. Farmers with suitable clay land, whether grass or arable, who have not the necessary tackle themselves, should get their County War Agricultural Executive to arrange for the mole draining of their fields.

BRUSSELS SPROUTS.

THE value of Brussels Sprouts has been proved during the recent severe winter in a marked degree, but, as *R. M.* points out, the plants need a long season of growth. A method of cultivation which has never failed here, but has enabled us to pick Sprouts from late September till April, is as follows: A frame is placed upon a mild hotbed, and filled with silted soil from the potting shed. The compost is made firm, and the seed sprinkled thinly on the surface, covered lightly and watered with a rose can. The frame is covered with a mat until the seeds germinate, and afterwards ventilated fully. As soon as the plants have made two rough leaves, a space in the garden about six feet wide is edged with nine-inch boards, the ground well raked, the seedlings pricked out about four inches apart, well watered, and covered with an old

fish net. The plants are damped overhead on warm days, and well watered at the roots occasionally. They soon make fine plants, and are ready for planting out when the leaves touch one another. I always plant second early Potatoes four feet apart on ground, choosing, if possible, land that has been recently cropped with Celery and Leeks. As soon as the Potatoes are through the soil, the Brussels Sprouts are planted between the rows, eighteen inches apart. The Potatoes may be earthed up without harming the Brussels Sprouts, and when the former are dug, the soil can be drawn up in turn to the stems of the green crop, thus giving them support until they are staked for the winter. Staking is beneficial as the plants yield much better if kept upright, and the space between the rows is utilised for late Turnips. It is a mistake to plant Sprouts closely as the stems lose much foliage; besides, the damp from the leaves in autumn makes picking inconvenient. The variety Veitch's Exhibition gave us stems between four and five feet long, with very firm Sprouts from top to bottom. If the Sprouts are not picked too close to the stem, they will develop a second crop of greens. Cudworth Rosette and Hardy Green have proved invaluable this winter, and were not injured in the slightest by frost, but Spring Cabbages are a sorry crop. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

BRUSSELS SPROUTS.

It is to be hoped that the planting of Brussels Sprouts will not be lessened by the statements in the R.H.S. pamphlet (see pp. 161, 171), although they may be true in respect to light and open soils. The figures given in the *Gardeners' Chronicle* (page 171) by the authors of the pamphlet, comparing the yield of Savoys and Brussels Sprouts per square rod, are convincing enough as to the relative produce values of the two crops. Yet, if I were asked to grow only one green crop for yielding a continuous supply during winter, I should select Brussels Sprouts as being the safest crop. From the point of view of the cottager and allotment holder, one favours the growing of Brussels Sprouts for a winter crop, and they are the easiest, cheapest, and safest crop, giving a succession of produce on the "out and come again" principle.

To grow good Savoys that will give a supply until March, at least three varieties are required, and the seeds used must be obtained from a very reliable source, otherwise failures by non-heating or by bolting may be experienced. Three varieties will mean three separate packets of seeds, which will also mean a surplus of seed unless the allottees co-operate. I do not recommend the buying of plants unless the source of the seed is guaranteed. The ultimate crop of Savoys will depend a great deal upon the state of the weather at planting time in June and July; if the young plants suffer from drought they will not develop good heads. According to the weather in winter each batch of Savoys may require to be utilised at once; this would be a great trouble to the cottager, and again if the weather in January and February is too mild, the late batches will bolt to seed and rot heart in at all. When comparing the Savoy with the Brussels Sprout, it seems that the Sprouts have the advantage by cropping more or less perpetually, especially if one is careful to pick only the lower and most open Sprouts on each plant, leaving the top intact until the last.

To those anxious to include Brussels Sprouts in their allotment scheme, I have suggested that they should raise plants by sowing seed early in March and pricking the plants out towards the end of April, one foot apart, with eighteen inches between the rows. This ensures very sturdy plants, which will produce Sprouts quite near the ground. As soon as the early Potatoes are being lifted the plants of Brussels Sprouts are transferred to the Potato ground; they should be taken up with a good ball of soil by means

of a spade and planted as soon as possible to prevent flagging. The distances I recommend are two feet or two feet six inches between the plants, and if the Potatoes are in rows, two feet apart, let the Brussels Sprouts be planted in alternate rows, that is, four feet apart. Between the rows of the earliest-planted Brussels Sprouts, Beetroot might be grown; the roots usually come large enough this way; the later-planted Brussels Sprouts could be intercropped with Spinach, Turnips, or Lettuce, as the demand required.

In autumn, when these "snap" crops are over, Spring Cabbages could be planted at eighteen inches apart, then in the following spring, after the Brussels Sprouts have become useless their place could be taken by Dwarf Beans, or even trenches made for Celery and Leeks. On larger plots the system of cropping might be: after Peas, dig and manure liberally, and in spring sow Spinach, Turnips, Early Beetroot, or plant Lettuces in rows, three feet apart. Raise the Brussels Sprout plants as suggested above, and plant them out at the end of May, between the "snap" crops, allowing two feet six inches between the plants, and three feet between the rows. The temporary crops are away before the leaves of the Brussels

FIG. 67. HYBRID BETWEEN THE SAVOY AND BRUSSELS SPROUT.

Sprouts get large. Liquid manure or dry poultry manure may be given at intervals up to mid-August to assist the plants to grow tall with strong, straight stems. All decayed leaves must be removed during autumn and winter to allow the Brussels Sprouts to dry.

After the Brussels Sprouts, dig in any waste leaves and shoots (not the roots) and crop with Potatoes or utilise the ground for Leeks and Celery.

When the authors of the R.H.S. pamphlet considered the question of Savoys versus Brussels Sprouts, I wonder whether they thought of a compromise by using the "Savoy Sprout" (see fig. 67). It will be a very useful vegetable when it has a longer stem, and this feature is sure to come with selection. *A. D. T.*

NETTLES AS A VEGETABLE

IN view of the shortage of green vegetables, the common Nettle may be made use of as a substitute for the next few weeks while the shoots are tender.

The green tops, cut 6 inches long, well washed, and boiled for twenty minutes in a small quantity of water make a most appetising dish much resembling Spinach; indeed, in the opinion of some, superior to that vegetable. *E. M.*

The Week's Work.

THE KITCHEN GARDEN.

By J. DUNN, Foreman Royal Gardens, Windsor.

LEEKS.—If seeds were sown in February with a view to producing large Leeks the plants should be ready for planting permanently. Narrow trenches may be prepared in the same manner as for single rows of Celery, digging a quantity of decayed manure into the bottom of the trench. Lift the plants carefully, and set them 18 inches apart in the rows. After the planting is finished water the plants to settle the soil about the roots. As the season advances, place soil carefully around the stems, until the trench becomes filled with earth. The crop should receive liberal supplies of liquid manure throughout the summer; one of the best times to apply this stimulant is just previous to earthing up the plants. Good Leeks, suitable for ordinary purposes, may be grown without trenches, provided the ground has been trenched, and well enriched with decayed manure. In this case set the plants in rows, made 18 inches apart, allowing a space of 1 foot between the plants in the rows. Another good way of growing Leeks is to make deep holes with a dibber, and drop the plants in the holes to the full depth of the stem, with just sufficient crumbling soil to cover the roots. The Leek is very hardy, and is often available when most green vegetables have been destroyed by frost.

SCARLET RUNNER BEANS.—Runner Beans form one of the most remunerative of crops, and will repay for extra labour incurred in a thorough preparation of the soil and care of the plants in their early stages. They should be planted in ground that has been trenched and manured during the winter, and allowed to remain rough on the surface until the time of planting. Early pods may be had by sowing seeds in 4 inch pots now, and growing the seedlings in a cool structure until it is safe to transplant them in the open. They will need protection both from rough winds and frosts for a time. The main sowing may be made in the open about the middle of May. It is important that the sticks be placed securely in the rows as soon as the plants are large enough to require support. Scarlet Emperor and White Emperor are two reliable varieties.

FRENCH BEANS.—An early crop of French Beans may be obtained by sowing in beds in cold pits. If the soil has been used for other crops during the winter it should be dug deeply and manured. Plant the Beans in shallow drills, covering them lightly with fine soil. Keep the pits closed until the young plants show through the surface, when a little air should be admitted during favourable weather, and some protection given by night. Beans may also be sown in small pots, and raised in heat with a view to planting them in cold pits. Plants in pots from which roots are being gathered should be given liberal supplies of liquid manure, and syringed twice daily to keep red spider in check.

CAULIFLOWERS.—All Cauliflower plants which have been wintered under glass should be planted out at once, or they may become stunted. Water them carefully before they are put out, and again when planting is finished, continuing to give careful attention to this matter until they become established. Frequent applications of manure water at the roots while the plants are growing will favour their development. Cauliflower plants in large pots should be stimulated by frequent light dressings of guano, or waterings with liquid manure from the farmyard. Seeding Cauliflowers, Brussels Sprouts, and spring-sown Cabbage should be transplanted into nursery beds as soon as they are of sufficient size for shifting.

POTATOES.—Main Crop and late Potatoes should be planted with as little delay as possible. Pulverise the ground thoroughly, and allow plenty of room for the plants to develop. Strong-growing varieties require a space of 3 feet between

the rows, and at least 15 inches between the sets in the row. Exercise great care in handling the tubers not to break the young shoots. The seed-tubers of all varieties are making shoots and should be afforded much ventilation to prevent the "spears" from becoming spindly. As soon as the shoots of the earliest plants show through the surface, protect them from frost by applying a covering of some light, dry material, which should be kept in readiness for the purpose. Keep the soil drawn close up to the stems, but do not allow it to cover the tops.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcott, Eastwell Park, Kent.

GLOXINIA.—The earliest plants of Gloxinia are developing their flowers. Place them close to the roof-glass in order that the flower-stems may grow firm and erect. When the pots are filled with roots, use a small quantity of artificial manure and a little soft water weekly. Seedlings raised from seed sown last January should be repotted when they are well rooted, for if they become pot-bound they will receive a check to growth. Gloxinias grown in a moderate temperature, staked thinly, and grown in plenty of light, develop firm foliage and give fine blooms over a long period.

WATERING PLANTS IN POTS.—At this season, when many plants have been repotted, and are not re-established in the new soil, great care and judgment are necessary in watering. The danger is greater now than the care of the plants is, in many establishments, in the hands of inexperienced assistants, who, at the slightest sign of dryness on the surface of the soil are apt to use the water-can. Once a plant falls into an unhealthy condition through over-watering, it is a hard matter to restore it. Soil used for potting should be sufficiently moist just to hold together when pressed in the hand. It will then contain sufficient moisture for the majority of plants for several days. In hot, sunny weather, light sprayings will be needed to keep the plants fresh. When the roots and moisture they should be well soaked, and this should suffice for some little time. Plants should never be repotted when the soil is dry. If possible, they should be watered thoroughly the afternoon previous to potting, thus giving time for the surplus moisture to drain away. Plants that have been resting all the winter, and with comparatively little foliage, require very little moisture at present than a daily spraying. As growth increases, increase the amount of water to the needs of the plant. Large Palms, Cordulines, and other specimen foliage plants, that have been growing in the same pots for several years, require a greater amount of moisture. Cyclamen, Isopetes, Pansies, and other grasses, that are usually grown in small pots, can never be kept in a good condition without an abundant amount of water at the roots. When the pots are filled with roots, the soil must never be allowed to become dust-dry, or the plants will quickly become shabby.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate.

COELOGLYNE.—Plants of *Coeleglyne cristata* and its varieties that have been afforded a short period of rest since passing out of flower are starting into growth, and may be repotted, but as these plants are impatient of frequent root disturbance they should not be repotted unless it is absolutely necessary. Large specimens may be afforded bigger receptacles, and those in an unhealthy condition divided and the sound portions potted separately. In repotting shake the old soil from the roots, and remove the useless pseudo-bulbs, leaving only four healthy pseudo-bulbs behind each leading growth. A number of these leading shoots may be placed together, more or less according to the size of the specimen desired. Pansies of medium depth form the most suitable receptacles, and they should be half-filled with clean crocks to ensure perfect drainage, covering the crocks with a layer of Sphagnum-moss. Arrange the com-

post highest in the centre, and direct the young growths towards the middle of the plant, pressing the materials moderately firmly about the rhizomes. A suitable rooting medium consists of rich fibrous loam and Osmunda-fibre in equal proportions, removing the finer particles and adding a liberal quantity of crushed crocks and Sphagnum-moss. Grow the plants in a shady position in a house having an intermediate temperature, and give them very little water until the roots have made considerable progress, and the pseudo-bulbs have regained their plumpness. At a later stage they should be given abundant supplies of moisture, and sprayed frequently overhead. If a plant is in a healthy condition, and does not require repotting, remove some of the old compost from the surface and replace it with fresh material. Such portions as may be projecting over the sides of the pots should be trained towards the centre of the plant and pecked to the compost.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR DAVY, Abbots Wood, Glastonbury, Strury.

DISBUDDING PRACH AND NECTAR TREE.—As soon as the trees are sufficiently advanced the work of disbudding, as the removal of superfluous shoots is termed, should be commenced. Remove all foreign and useless shoots, and see that a strong "break" is left at the base of each remaining shoot or branch, for it is these that will form the fruiting branches of the following season. Leave at the apex of each growth a suitably placed leader, which, if not required for extension, may be stopped at a later period. In the case of young trees, leave as many growths as are necessary to furnish the main spurs, taking care, however, not to train more than are required. Arrange the shoots thickly and evenly in order that the wood may become thoroughly ripened. Do not hesitate to remove fruitless branches, as these trees will be gradually occupied by new growths. It is at this season that over-crowding of the branches becomes apparent, and as crowded branches often harbourers of insect pests, and develop only puny fruit, and impede the free impartment of proper nutrition of the growths, cannot be over-estimated. Disbudding should not be completed at one operation, but the trees should be gone over three or four times, removing the stronger shoots first, and after that the weaker ones.

NEWLY GRAFTED TREES.—Examine the scions and shoot carefully, and take measures to support the main shoots, and guard against strong winds. The shoots may be tied to small stakes inserted in the ground. Another method, where the stocks are seedlings growing in pots, is to insert strong stakes in the soil at intervals and fasten Bamboo-rods across the top. The small upright stakes may be tied to the cross-pieces and the shoots secured. On dry days spray the grafts with lukewarm water. Keep the soil stirred with the hoe and free from weeds.

FRUITS UNDER GLASS.

By JAS. HINSON, Gardener to Mr. Leonard de Rothschild, C.V.O., Gonesbury House, Aton, W.

VINERIES. I am more than ever convinced that it does not pay to start permanent Vines before the New Year. More especially is this true in gardens where fogs are frequent, and the atmosphere much laden. Pot Vines are best for obtaining early bunches, but these are somewhat costly. The berries are colouring, but no attempt should be made to hasten their ripening; rather keep the temperature somewhat lower. If the temperature of the house is 65° at the time the fires are banked, and a little air admitted through both the top and bottom ventilators, the berries will finish well. These remarks apply also to early permanent Vines, with Grapes commencing to colour. Where, in later Vineries, the berries are swelling after stoning, do not allow the Vines to make an undue amount of growth, but stop the shoots freely. It may be advisable, however, to allow a little latitude in this respect to obtain an equal distribution of leaf-growth without crowding. Keep a sharp watch for red spider

and syringe the Vines freely with water directly the pest is detected. Do this at the time of closing the houses. The shoots of Vines in this stage of growth should be tied to the wires. The thinning of the bunches on later Vines should be done forthwith. I do not approve of the tying up of the shoulders of large bunches, there is no practical utility in such a practice; far better reduce the size of the bunches at first.

CHEERRY TREES IN POTS. Cherries have set remarkably well in these gardens on pot trees, and the fruits are swelling fast. The bunches have been cleared of the scales at the base around which a few caterpillars often harbour. To destroy this pest, and to guard against attacks of aphid, the house has been fumigated. With milder weather no fire heat will be needed. Our earliest fruits are showing colour, the variety being *Gaigue d'Annonay*. The plants need a top-dressing, and will be given a mixture of Hop manure, manure from a spent Mashroom-bed and turf loam. The compost should be used on the damp side in order that it may cling together when pressed in a ring around the top of the pot. Water freely trees that are bearing well, and feed them on two or three occasions with weak liquid manure, at a strength no darker in colour than sherry wine.

THE FLOWER GARDEN.

By W. J. GUSE, Gardener to Mrs. DEMSTER, Keele Hall, Staffordshire.

DAHLIA. Shift young Dahlia plants into larger pots, as they require more room; steady growth and plenty of water are essential to success. The points of the shoots should not be pinched out, but a neat stake placed to each plant. Occasional syringings with an insecticide will keep the plants free from aphid. Place the old tubers in cool frames, and cover them with a light compost. The roots may be divided now or at a later period.

NYMPHAEA. During the next few weeks Water Lilies may be divided and replanted, and it will facilitate the work at the lake or pond in which they are grown is emptied. The lakes at Keele are in a valley, and each can be emptied independently of the others. If the depth of water varies, plant the shallow parts with varieties that are the least robust and with compact habit, reserving the deeper parts for stronger growing sorts. For most varieties a depth of 2 feet is suitable. Shallow baskets form the best receptacles in which to plant, and light perforated tubs, boxes, or even sieves are also suitable. Filling these, moulds may be made with stones with the tops situated just below the water level. The plants should be tied in the receptacles, which should be filled with rich, fibrous loam. After the plants have been sunk in the water no further attention is necessary beyond removing decayed foliage, dead flowers, and rubbish. Established plants will readily respond to top-dressings of fresh fibrous loam. A few of the best varieties are *Nymphaea sanguinea* (black), *N. Gladstoniana* (white), *N. Froehlii* (purple), *N. Elliana* (purple), *William Dawson* (pale pink), and *N. Ladykeri* (pale green). The last-named should be planted in shallow water. Nymphaeas may be raised from seed sown under glass in pots filled with a heavy compost; place the pots in tubs containing sufficient water to just cover the surface. Change the water occasionally. Place the seed lines in small pots directly they are large enough to handle, returning them to the tubs immediately. Shift them into larger pots as required and plant them in the lake when they are of a suitable size.

PLANTING HOLIBES. If care be taken to lift specimen Holibes with a good ball of soil success in present planting will be assured. Syringe the roots with clear water directly the plants are lifted to keep them moist until they are again covered with earth. Ram the soil firmly around the ball of roots, and water the litter liberally directly planting is finished. A mulch of moisture-retaining material spread over the roots will be beneficial. In dry weather syringe the plants daily for a week or ten days after planting.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W. C.

Editors and Publisher.—Our correspondents would oblige by not delaying in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction in gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication. as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last 20 years at Greenwich, 51.6°.

ACTUAL TEMPERATURE—*Gardeners' Chronicle* office, 41, Wellington Street, Covent Garden, London, *Thursday*, May 3, 10 a.m. Bar, 29.8. Temp. 41.5°. Weather, Sunny.

SALES FOR THE ENSUING WEEK.**WEDNESDAY**

Herbaceous Plants, Rhododendrons, Roses, Clematis, Begonias, Gloxinias, and Lilies, by Protheroe & Morris, at 65 and 67, Chispeale, E.C.4, at 12 o'clock.

Fumigation with Hydrocyanic Acid Gas.

The conclusion reached by Messrs. Samsel and Borden¹ is one which has been already

urged in these pages, that hydrocyanic acid gas (hydrogen cyanide) is, in competent hands, a safe and certain means of destroying all—or almost all—the insect pests found in greenhouses, including thrips, aphides, white flies and scale insects.

The authors recommend the use of porcelain or glazed earthenware jug-shaped jars as generators, and advise that the jug should be provided with a corrugated cover of copper or corrugated iron, the grooves of which allow the gas to escape more gradually than is the case when open jars are used.

Other appliances required are a balance, reading to 1-10th ounce, an 8 ounce graduated jar for measuring acid and measuring acid and water, and bags or tissue paper in which to place the cyanide.

Before fumigating, replace all broken glass in the greenhouse and seal all cracks; adjust the ventilators so that they may be opened from the outside of the house after

fumigation is finished. The authors give the following simple method for finding the cubic contents of the house: Make a sectional plan, thus:—

Area of section = A + B + C.

$$\text{Area of A} = 20 \times 5 = 100 \text{ sq. ft.}$$

$$\text{.. B} = 10 \times 5 = 25 \text{ ..}$$

$$\text{.. C} = 10 \times 5 = 25 \text{ ..}$$

150 ..

150 × length = cubic contents (feet).

If the house be 12 span:—

Area of section = A + D + B + C.

$$\text{Area of A} = 6 \times 8 = 48 \text{ sq. ft.}$$

$$\text{.. D} = 18 \times 5 = 90 \text{ ..}$$

$$\text{.. B} = 6 \times 4 = 24 \text{ ..}$$

$$\text{.. C} = 18 \times 7 = 126 \text{ ..}$$

$$\text{.. D} = 18 \times 7 = 126 \text{ ..}$$

213 × length = cubic contents (feet).

Do not fumigate earlier than one hour after sunset nor in windy weather. Choose a night neither very cold nor very warm, for the best results are obtained between 55° and 68° Fahr. When the house contains a mixed collection a light fumigation only is safe, and this will not destroy eggs. Hence a second fumigation must be given after eggs undestroyed by the first have hatched out. The materials are sodium cyanide, sulphuric acid, and water.

Sodium cyanide may be bought in 1 ounce lumps, must be kept in airtight tins labelled "Poison," and stored in a safe place. It must contain 51 per cent. cyanogen. Commercial sulphuric acid (about 1.84 specific gravity or 66° Baumé), 93 per cent. pure, gives satisfactory results. Keep it in glass-stoppered bottles and store them in a safe place. If spilled on the hands or clothes it burns them seriously.

Tender succulent plants are more susceptible to injury by hydrocyanic acid gas than are woody plants. When delicate plants are among those to be

treated, use the fumigant at the rate of $\frac{1}{4}$ ounce of sodium cyanide per 1,000 cubic feet. The authors eradicated white fly with three successive fumigations at intervals of seven or nine days by using $\frac{1}{2}$ ounce of sodium cyanide per 1,000 cubic feet, in houses containing Coleus, Ageratum, Heliotrope, Fuchsia, and similar plants, and the foliage was uninjured. Houses which do not contain Roses, "Asparagus ferns," Verbena, Antirrhinum or Sweet Peas, may be treated with $\frac{1}{2}$ ounce sodium cyanide per 1,000 feet.

Cattleya Trianae suffered no injury from fumigation with this strength for one hour. Chrysanthemums, on the other hand, were burned severely. Adiantum, Lastrea, Nephrolepis and Polystichum were uninjured by fumigation with $\frac{1}{4}$ or $\frac{3}{8}$ ounce sodium cyanide. For each ounce of sodium cyanide use 1½ fluid ounce of sulphuric acid and 2 fluid ounces of water. Having fixed on the amount to be used in each generator so that the total amounts are those required for the whole house, add to each generator just the measured quantity of water, and after that the measured quantity of sulphuric acid; then, having previously weighed out the requisite amounts of sodium cyanide and having wrapped each in a paper bag, carry the bags to the end of the house furthest from the door and drop gently but quickly a bag of sodium cyanide in each generator, and in no case stop during the operation until outside the closed door of the house. It is best to place generators at every 20 or 25 feet. Short exposures with greater strengths are better than long exposures with a weaker strength of fumigant. One hour is generally a satisfactory period.

Ventilate thoroughly after fumigating and before entering the house. With a breeze, ten to fifteen minutes is sufficient, but on a still night allow double the time to elapse. Do not fumigate when the temperature is above 70° F. or below 55° F.—at all events, not below 50° F.

Light increases the chance of injury. Therefore fumigate at night, and if on the following day it is very sunny shade the house.

Much moisture in the house will not increase the risk of damage to the plants, but since the gas is soluble in water the strength will be reduced. It will be best to syringe the plants four or five hours before fumigating them, so that any excess of moisture will have time to evaporate.

If the air is very moist and also very warm—70° to 75° F.—the foliage suffers, but at 60° to 65° F. high humidity (98° to 100°) produces no damage to the plants. It is a great advantage to have a fumigating box of a capacity of 200 cubic feet in order to test the strength of fumigant that a particular class of plant will stand.

Finally, the authors of this valuable bulletin make the interesting observation that the growth of many plants is not only uninjured, but actually stimulated by fumigation with hydrocyanic acid gas.

¹ Fumigation of Ornamental Greenhouse Plants with Hydrocyanic Acid Gas. Bull. 513, U.S. Dept. of Agric.

"PETER BARR" MEMORIAL CUP.—As we announced last week, the Narcissus Committee of the Royal Horticultural Society has awarded the "Peter Barr Memorial Cup" to Mr. WALTER F. WARE, of Inglestone, Bath. It will be remembered that this cup was established as the outcome of a wish of some of the late Mr. BARR's admirers to do something to perpetuate his memory, and a joint committee of the Floral and Narcissus Committee of the R.H.S. was appointed to carry out the project. This joint committee placed the cup in the hands of the R.H.S. to be awarded every year by the Narcissus Committee to anyone who, in its opinion, has done good work of some kind on behalf of the flower.

FRENCH HORTICULTURE AFTER THE WAR.—Our contemporary, the *Revue Horticole*, reports an address given by Monsieur CHEVENEY, vice-president of the Société Nationale d'Horticulture de France, and president of the Union Commerciale des Horticulteurs et Marchands crémiers de France. The address was given before the Association Nationale d'Expansion Economique, and contained a programme of measures which he suggested should be taken after the war, in order to restore French horticulture, and still further develop it. Monsieur CHEVENEY recommended, among other things, a protective tariff, special railway rates for produce, the reorganisation of approved novelties, the suppression of the system of foreign middlemen, the capture of markets beyond the French frontiers, a complete commercial organisation, and the diffusion of horticultural instruction.

POTATOS IN ICELAND SEVENTY YEARS AGO.—How capricious the Potato plant was, last year, you will see by the enclosed extract from a German paper, which announces that of all places Iceland was particularly favoured with good Potatoes. "According to news from Iceland that island was visited last autumn by a variety of successive epidemic diseases, among others a bloody flux, which some considered as a consequence of the eruption of Mount Hecla. Mortality was generally very great. In the autumn and winter of 1846 and 1847, smoke was observed to issue from the volcano. In Reikjavit, and the neighbourhood, earthquakes were felt on the 15th February, and on the nights of the 20th and 3rd of March, and alarming movements were experienced at Reikjafj in the parish of Hlíðuvæli, so that the houses, beds, and everything that was loose fell down. It is, however, worthy of remark that the cultivation of Potatoes seems to be not very extensive in this island, was extremely successful last autumn, and the crop was so much so that the exportation of thirty tons of the manse of Loevavatn, in the northern district." *Gardener's Chronicle*, May 1, 1847.

APPOINTMENT.—The Secretary of the War Office has issued the following item of news:—Mr. J. A. COOPER, agent for Sir JESSAY GARRIBER, Lassadell, Sligo, Ireland, has recently been appointed to take charge of the new Raw Materials Finance Branch, which deals with the business of such matters as Home and Colonial wool, hides, flax, jute, hemp, and timber.

WOMEN AND THE LAND.—The Board of Agriculture has appointed the Women's National Land Service Corps as agents for the organisation of women workers for temporary unskilled agricultural work. The chief need at present is for supplementary labour in places where local labour is scarce, to secure the adequate weeding of crops, and, later, the harvesting of Corn and fruit.

SALE OF THE WALTON GRANGE ORCHIDS.—The sale by MESSRS. PROTHROBE AND MORIS last week of the collection of Orchids formed by the late Mr. WILLIAM THOMSON was very successful, both trade and private buyers being well represented. The total amount realised was just under £2,500. *Odontoglossum*, for which the collection was noted, realised good prices. *O. crispum* Solms fetched 60 gs.; *O. c. Palatine*, 44 gs.; *O. c.*

Alabaster, 30 gs.; *O. c. Perfect Gem*, 20 gs.; *O. King Albert*, 50 gs.; *O. Waltonense* Alabaster, 35 gs.; *O. Walton Gem*, 36 gs.; and other hybrids from 20 gs. to 55 gs. each. *Cattleya Lady Vetch* 50/4 for 54 gs., *Cypripedium Acteans Bianca* Westonbury variety 22 gs., *C. Desdemona* 26 gs., and *C. Waltonense* magnificent 20 gs.

IMPORT OF BULBS FROM FRANCE. French bulbs growers are uneasy lest the prohibition on the import of bulbs from foreign countries into England be extended, during the current year, to apply to France, which has hitherto been excepted from the general prohibition. The growers have prepared their crop for 1917, and feel that it would be a hardship, involving huge loss, if the harvest were excluded from these islands. Several of the larger organisations representing the interests of the bulb growers approached the French Government on the subject. Monsieur CLUMESTER replied that he had placed the matter before the English Government, representing to them

in this way that certain plants without having fires at all. When there are only occasional outbreaks of sunshine, the restricted ventilation sustaining the heat during the dull periods. The growth that plants make under sun-heat is healthier and more vigorous than that produced in considerable artificial heat, which, if employed in excess, causes great mischief. Nothing contributes more to the benefit of Orchids, stove and other hot-house plants than high temperatures that result from sun-heat, especially in spring and autumn. Excellent crops of Cucumbers have been grown in un-ventilated houses heated by sun-heat, and with very small amounts of manure forming the hot-beds inside. Much might be said on the subject, but as the requirements of different gardens vary much, it will suffice at the moment to call attention to the subject. Owing to the war, many plant-houses will be diverted from their customary use, and by utilising sun-heat and providing hot-beds they may be employed to provide food crops, and much of the necessary work, provided it is properly supervised, can be

FIG. 66. *SOLM-SOLMIFLORUM*. FLOWERS WHITE (80 p. 186.)

the advantages of permitting the entry into Britain of the products of the French bulb growers.

THE VALUE OF SUN HEAT.—There is every reason to believe that greater use could be made of sun-heat for maintaining the temperature in glass structures employed for growing plants and fruits, and in view of the present need for economising fuel, gardeners should give the question their serious attention. In many gardens there might be greater restrictions on the ventilation of the houses, especially in the spring, when, owing to the presence of cold winds, ventilation is by no means an unmixed blessing. At such times ventilation from the bottom ventilators will generally be sufficient, some escape at the top being provided by the laps in the glass and other small openings. On bright days, before the sun becomes powerful, check or damp down the fires, as these will not be needed again until the afternoon, damping down the floors and closing or partly closing the ventilators in order to maintain the required temperatures. In summer much can be done

carried out by means of unskilled labour. There is just one point on which a word of warning is necessary, namely, the danger there is in reducing the ventilation on sunny mornings for the purpose of increasing the temperature. The higher the temperature, the more moisture is necessary, and in its absence scorching would be bound to follow.

WAR ITEM. Private Alfred Davis writes us as follows: "I thank you for posting me the *Gardener's Chronicle* each week to Mesopotamia, where it is read with much interest by me and my comrades who in civilian life are gardeners. My address is 'Somewhere in Mesopotamia,' as usual. I shall be glad to hear from any of the Inwood boys who are now serving their King and Country in the various theatres of the war. Some of us who used to be at Inwood will, I hope, meet again after the war, unless we get a 'top-dressing,' as we say in gardening language. No doubt many gardeners will be glad to see their men back from the wars." I see by the *Gardener's Chronicle* that many of the large gardens in England have sent

all their staff, so our head gardeners will be much overworked, especially at this time of year. However, instead of thinning Grapes, we have to now thin the enemy, and we hope to "top dress" him heavily. I wish the old paper every success."

SEDUM RARIFLORUM.

THE distinct Chinese sports of *Sedum*, illustrated in fig. 68, has a perennial woody root-stock, and produces numerous annual stems. The shoots are well furnished with narrow, green, sharp-pointed leaves, and terminate in an inflorescence of satiny-white flowers. Unlike the majority of the members of this genus *S. rariflorum* is of a neat, attractive habit, with stems from 4 inches to 6 inches high, forming a compact, bushy-like tuft. The plant is quite hardy at Kew, having survived the recent cold winter in the rock garden, and is now coming up strong again. Specimens were received at Kew from Mr. F. N. Meyer, of the American Legation in Peking, who found it in the Chihli Province in Northern China in 1913. They flowered freely in June the next year. The species is easily propagated by means of cuttings, and does well in freely drained, gritty soil. W. J.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

EXPERIMENTS WITH HUMOGEN (pp. 115, 157, 146, 166).—As concerns chemical standardisation of Humogen, Mr. Chittenden apparently relies on the "quantity of nitrogen" surely this can be of little value until one knows in what combination that nitrogen exists. If a nitrogenous body is the agent at work, the actual amount of that body must be estimated before chemical standardisation comes into argument. The method of "indirect measurement" hardly seems to be of the nature of a criterion of standardisation, for so many of the factors at work are unknown or not at present recognisable. The rows were about 10 yards long, with 16 plants; the figures represent the produce of each plant in lbs. Yeast and lime 4.61; Rite 3.55; old Humogen 4.09; nil 4.04; nil 3.72; new Humogen 4.06; nil 3.20; nil 3.64; nil 3.52. Ridge trenched area nil 3.93; am. sulp. 3.95; ditto 4.06; new Humogen 3.64; nil 4.07; ditto 4.06; ditto 4.05, all consecutive. Sixteen other rows are only counted in the grand average, the ends of some coming near a Hornbeam hedge and another a different variety. In the ridge trenched area, except the Humogen row, the figures per row are practically level; on the other path the untreated rows have rather greater limits, but only one came up to the 4 lbs. In such small trials definite results must show some 20 or more per cent. of concordant difference. I hardly think that we can yet name the bodies which may be considered to contain available nitrogen in such complex material; nor yet tell how much of their respective nitrogens are really available, and that until we can do so we are not in a position to lay down a law of standardisation. Differences may also be due to instability, inherent or due to some factor to be discovered. With the differences between rows given by Mr. Chittenden, it would appear advisable to place the rows at right angles in alternate croppings. H. E. Durham.

DAMAGE TO PLANTS BY FROST AND WIND AT BROADSTAIRS.—The extent to which vegetation has suffered here from the very severe weather of the past winter can now be fairly well estimated. Some plants have been injured more by the violent, biting winds than by low temperatures; others have been hopelessly injured, or killed outright, by intense and continued frost. I do not propose entering into full details, but will give a few examples of plants

generally classed as hardy in the South of England, including the South East, my selections, where not otherwise explained, being from the "front," where there are no trees larger than medium Laburnums. Not less, probably, than 25 per cent. of the shrubs are *Euonymus japonicus* in variety, and these have proved the hardest of all the kinds with which they are associated. Exposed for days to the full blast of a half gale from the north east, with the lowest temperature about 25° Fahr., the leaves were killed, but new shoots began to unfold with slightly milder weather. Many of the ordinary green-leaved variety are throwing foliage of a clear yellow of the Evening Primrose hue, giving the bushes the appearance at a short distance of bearing terminal flowers of an ornamental character. Broadstairs, like some other southern watering-places, has been noted for some years for the almost ubiquitous *Chrysanthemum* (*Pyrethrum*) *frutescens*, in front gardens of all aspects, where it flowered profusely almost all the year round, especially in southern and western aspects. Apparently not a solitary individual has escaped death, and there were many fine specimens of considerable age. *Berberis Darwinii* and *B. stenophylla* in the shrubberies on the "front" are quite dead, or badly injured, owing partly, perhaps, to repeated hard pruning and consequent loss of vitality. Sweet Bays and Laurastins, and young *Pinus insignis* are severely cut, more probably from wind than low temperature. New Zealand *Veronicas* have succumbed in exposed situations, whilst the Mexican *Choisya ternata* has escaped in sheltered places. Wallflowers and Stocks are killed, or injured, in similar situations. A large tree of *Cupressus macrocarpa* below the cliff in the north east cusp of the bay is only slightly discoloured, whilst younger examples in the town have the appearance of being dead. What strikes one particularly in this connection is the unequal distribution of cold waves, and their effects. For example, the minimum on February 3 at Ramsgate was 20° Fahr.; at Broadstairs, 24°; and at Margate, 21°; whilst at Canterbury, less than twenty miles inland, the thermometer fell to 7° Fahr. on February 1, the Broadstairs instrument registered 19° Fahr., and on the 6th it dropped to 4° below zero at Benson, near Wallingford, Berkshire. This, I believe, was the minimum for the month in all England. Benson is less than 200 feet above sea level, and one is puzzled to account for this local development of cold; but meteorological records offer many problems difficult of solution. W. F. Howbery.

A MAMMOTH POTATO.—The immense tubers of Potato Dutch Red, mentioned on p. 165, must have been imposing, and, no doubt, many in this country would desire to grow the variety, if only out of curiosity or by way of experiment. The climate of California would be in favour of quality; and if the name indicates that it is of Dutch origin, it would also suit the sandy soils of that country. That would also raise the suspicion that it was this variety, or one resembling it, that came under my notice some decades ago in the fields of a relative. The tuber was a reddish-purple kidney if I have not seen the illustration in *Horticulturalist*, varying from 6 to 9 inches in length under field cultivation. I had some tubers, but the variety was never cultivated to any extent. A large number of the tubers were stabled by the fork in digging them, notwithstanding care. One could never tell how far they extended from the stem of the plant. They were equally troublesome to lift by the plough. J. F.

EFFECT OF GRASS IN ORCHARDS (see p. 106).—The following observations may be of interest to *Southern Grower*. Some of my Iris plants were left unweeded last year and the ground around these was lightly carpeted with young Grass. When top-dressing them this spring I found that wherever the soil was bare the roots, or some of them, were running out horizontally quite close to the surface, being but half an inch deep or less, so that it was impossible to hoe or stir in the manure without disturbing or breaking them. But where the ground was covered with grass the roots were all much deeper and the whole sod close up to the tips of the rhizomes

could be pared off one to two inches deep and turned over without meeting with any roots. This was the case without exception, irrespective of the variety, for in some instances the grass was on one side of the plant only, and there the roots ran deep, while on the other side, in the bare soil, the roots were on the surface. Nor does the condition of the soil have any influence, whether hard trodden, as in the alley ways, or loose between the rows. If grass in orchards has the same effect on the roots of the fruit trees, forcing them to run deep, it may perhaps explain the checked growth and diminished size of the fruits. A. J. Bliss.

THE SPRAYING OF POTATOS.—The note on this subject in your last issue (see p. 172) concludes with the remark that "it will probably be found that the organisations that have been established in the villages will purchase these machines, and arrange for the carrying out of the spraying operations on the allotments." If that be done, the risk to which the crops, in other circumstances, would be subjected, will be considerably reduced. The few words of the quotation which I have italicised are of the utmost importance if the Potato crop is this year to be as immune from disease as it is possible for human effort to make it. In some districts allotments may be numbered by the hundred—I write from one where there are six hundred of a permanent character within a mile, and I know not how many more plots of a temporary character that have only been started this year. In all the districts there is, at the present, no gardening society or organisation. When recently giving an address on Vegetable Culture I urged upon those assembled to form themselves into an allotment-holders' association for the purpose of purchasing spraying machines, artificial and other manures, and, if necessary, to secure paid men to undertake the work of spraying at the right time. I pointed out that a farthing subscription per week, or say, a shilling a year, would from the number given produce an annual income of £50, a sum which would go a long way towards purchasing spraying machines and materials. But even with that difficulty overcome, there is still the greater one to be faced of getting the spraying done before the disease puts in an appearance. In the vast majority of instances, those having allotments have but an hour or two in the evening to devote to them, and so infections in a disease as the Potato disease may overwhelm whole areas before, in the ordinary course of events, it can be combated. Moreover, the ordinary allotment-holder knows little of the infectious nature of the disease, or that it is important when spraying that all parts of the plant—the under-surfaces of leaves as well as the upper-surfaces—should be wetted. The many thousands who this year are cultivating plots of ground for the first time are in an even worse plight. This is revealed by the elementary questions they put to one from time to time. Hence it would appear that in districts where no organisation exists nothing short of a properly-organised band of sprayers—men or women—can adequately meet the case. H.

CHIONODOXA.—Sir Herbert Maxwell's remarks on *Chionodoxa* on p. 169 induced me to look up what Mr. Bowles had to say about *Chionodoxa* in *My Garden in Spring*. Sir Herbert does not refer to *Chionodoxa*, the only form which is now in bloom with me at Duddingston—all the others are over. Mr. Bowles says of it: "C. Tindal (roughly spelt Tindalst sometimes, as if named after a man instead of the mountain), but which I and also the Dutch growers find has a habit of dying after seedling, otherwise it would be a pleasant wind up to the *Chionodoxa* season." I have not found it behave in this way in Scotland. I have half a dozen little colonies of it planted three or four years ago, and I find it improving every year. On my table now I have beautiful sprays of it, each carrying eight very bright star-shaped flowers—large, pure white centres with soft blue tips—quite an inch and a half from tip to tip. I consider it the most brilliant of all the *Chionodoxas*. Possibly our climate in the north is too cold for it to set seed, and hence it behaves otherwise with me than with Mr. Bowles. I shall observe carefully this season and see if any seed-pods form. W. Cuthbertson, Duddingston.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

APRIL 24.—*President*, Mr. E. A. Bowles, M.A. (in the chair); Sir Edward van Thunm, Messrs. E. M. Holmes, J. Fraser, E. J. Allard, W. Hales, and F. J. Chittenden (hon. sec.).

Forms of Agrostis alba.—Mr. J. Fraser showed a series of specimens of forms of *Agrostis alba* from various localities, illustrating the wide range of variation which this species exhibits in its range from seashore to wet pasture lands.

Primula sinensis.—Mr. Bowles showed specimens of the two forms of this Chinese species, the one with the other without, scent. Mr. Farrar has given an account of the two in his report of his Chinese journeys. He also showed flowers of the form called *Primula Loebii*, nearly related to *P. farinosa*, but forming stolons and several plants around the parent one.

American Gooseberry Midge.—The following note on observations made by Mrs. E. V. Horne at the R.H.S. Laboratory at Wisley, on the effect of Burgundy mixture on the winter fruits of the American Gooseberry midges was read:

During the late autumn and winter I collected and examined a large number of twigs from Gooseberry bushes affected with the American Gooseberry midges at Wisley, which had been sprayed with Burgundy mixture by Dr. Horne in July, 1916, with the object of discovering whether the spraying had destroyed the vitality of the perithecia (winter fruits).

Spraying was done after mature winter fruits had formed on a large number of the twigs. Prior to the spraying, several twigs were labeled, viz.: 1. Twigs without midges; 2. Twigs with white midges only, perithecia not formed; 3. Twigs with mature perithecia.

The results were as follows:

1. Twigs not midged at the time of spraying. No midges subsequently appeared.

2. Twigs with white midges but no perithecia at the time of spraying. No perithecia were subsequently observed, with the exception of a very few young ones in a few cases, probably present at the time of spraying. The contents of these were destroyed.

3. Twigs with mature perithecia present at the time of spraying. The perithecia contained shrunken asci and shrivelled ascospores, so as to resemble, when immersed in water or dilute sugar solution and pressed out, the perithecia burst within a few seconds. The ascospores were not discharged naturally, and failed to germinate.

The perithecia from unsprayed bushes, used as a control, discharged perfectly healthy asci and ascospores, which did not burst when immersed in sugar solution, but sometimes burst in water after the lapse of a comparatively long period. Ascospores were discharged from these perithecia and collected on cover glasses arranged at a distance of one quarter of an inch to over two inches from the perithecia. On several occasions the ascospores germinated, producing a short germ tube. Unsprayed twigs from other localities yielded similar results.

Twigs sent for examination from a locality where the operator admitted that the bushes were sprayed with a mixture imperfectly prepared yielded a large proportion of perithecia capable of setting spores.

The question of ascospores has been observed in December, January, March, and April.

From these results it is evident that spraying with Burgundy mixture was effective not only in preventing the appearance of midges, but also in destroying it when present, whether in an early or in an advanced stage in its life history.

The mixtures used were:

Copper sulphate	9½ oz.
Sodium carbonate (washing soda)	11 oz.
Soap powder	6 oz.
Water	6 gallons

and

Copper sulphate	9½ oz.
Sodium carbonate (washing soda)	11 oz.
Soap powder	12 oz.
Water	12 gallons

Obituary.

ROBERT SINGLETON.—Mr. Robert Singleton, for sixty-five years in the employ of Messrs. E. P. Dixon and Sons, Ltd., Hull, died at his residence, 70, Ryde Street, Hull, on the 25th ult., in his seventy-ninth year. For nearly fifty years of this long period deceased was manager of the firm's nursery at Scarborough, and afterwards at Catterham. He attended to his duties until a week prior to his death, but had a seizure on the 15th inst., and died five days later. As a nurseryman he ranked high in his profession, and was well known to gardeners and members of the nursery trade throughout the country. He will be well remembered by the older generation of gardeners as a successful exhibitor at the leading shows thirty years ago.

EDWARD WILSON.—We learn with regret of the death of Mr. Edward Wilson, for twenty years gardener to Lord Lilford, at Lilford Hall, near Oundle. Mr. Wilson was well known in Northamptonshire and South Lancashire, also in the Preston district of Lancashire. After occupying the position of foreman at Lilford

MR. ROBERT SINGLETON.

Hull, for two years he was appointed gardener to the Earl of Lindsey at Clifton House, leaving Clifton to take up a similar post to the Hon. J. Pease, at Preston, where, during his two years' stay he made many improvements in the gardens. When the present Lord Lilford succeeded to the peerage, Mr. Wilson was invited to return to Lilford Hall as gardener, where he served for twenty years. Three years ago, failing health compelled him to seek well-earned retirement, and his resignation was accepted with great regret by Lord Lilford, who granted him a pension.

JAMES LONDON WOOD. We announce with deep regret the death, on the 25th ult., of Mr. James London Wood, managing director of the firm of William Wood and Son, Ltd., horticultural establishment. Deceased, who was 72 years of age, had been unwell for some considerable time, and died as the result of an operation. For over 50 years Mr. Wood was the proprietor of Wm. Wood and Son, Ltd., Wood Green, in BEE the business was formed into a limited company, with Mr. J. L. Wood as managing director, which position he held at the time of his death. He was a Freeman and Liveryman of the City of London. He leaves a widow, three daughters, and seven sons, four of whom hold commissions in the Army, another being in the Royal Naval Air Service. During recent years, Mr. A. J. Wood, the eldest son of deceased, has taken an active share in the management of the company.

CROPS AND STOCK ON THE HOME FARM.

THE REARING OF TURKEYS.

THAT turkeys can be reared successfully at a profit to one with experience will deny. Many imagine that these birds are especially difficult to manage, and as a consequence they are deterred from keeping them. With good management turkeys are not difficult. Much, however, depends upon the weather, which has a distinct influence, for a dry summer is all in their favour, whereas continuous wet and cold cause chills, diarrhoea, and roup. Even with these drawbacks the beginner need not be deterred if only he will follow advice.

Where turkeys are reared every year, either privately or for sale, it is wise to keep stock birds. A healthy hen will lay thirty eggs in one season. This estimate will guide the beginner as to how many hens he requires. One male is sufficient for ten hens. Some recommend not mating turkey pullets with a cockerel, but with the latter mate hens year-old birds and a year-old male with pullets. My experience leads me to say that pullets and cockerels together are quite satisfactory.

A tree grass run is a distinct gain for the birds. The only objection to this is that the hens are fond of laying their eggs away in seclusion, which means that without constant watching the eggs will be lost. An orchard of an acre or two would be an ideal run, and secluded places can be arranged with boughs, under which the hens would make their nests. The birds should be well fed, but not made too fat. Oats are good food during the day, and plenty of green food, with warm meal in the morning. A regular supply of grit is essential for shell formation, which has a bearing upon hatching results, as thin-shelled eggs are easily broken by the hens. Although turkeys are easily hatched in incubators, I prefer to put them under hens, as I think the pullets make greater progress, especially during cold or wet weather. Ten eggs are sufficient for one hen to cover properly, and twenty-eight days is the normal period of incubation. When the pullets hatch remove the shells, but do not attempt to hasten hatching by the removal of the shells from the chicks, for if the chicks are made to bleed they are almost sure to die.

Allow them to remain under the hens until thoroughly dry, as they do not need food for the first twenty-four hours. Place a boarded floor coop on grass, covering the floor with a dry, clean bag for warmth, and frequently change the bag for at least a fortnight, according to weather conditions. The first feed should be hard-boiled eggs, soaked chicken meal, and chopped green onions. Feeding the last, green chives are a good substitute. The chicks should be fed four times daily, just a little at a time. For the first fortnight they should be confined to a wire run in front of the coop on grass, changing the site daily. Stale ground and stale food are against success. As the pullets increase in size the coop should be moved on to a new site at least twice daily.

STIMULATING THE CORN CROP.

Among cereals no crop responds to a little stimulant quicker or with more advantage to the yield than Oats. When the seed is sown on land not in good heart—which at times cannot be avoided because of a shortage of manure—the Oats come up weakly and require stimulating to ensure a full crop. Where wireworm is prevalent, certain fields will be found to be more infested with the pest than others, and weakly growing plants suffer the most. One hundredweight of sulphate of ammonia, or even half that quantity, sown evenly over the plot will give the necessary impetus to growth, thus combating the wireworm. It will add several sacks per acre to the crop, and give a corresponding increase in the bulk of straw, which is a valuable asset, and will be specially useful next winter as food for store cattle. Early may be treated in a similar manner, but the stimulant should be applied more cautiously, as this crop is more liable to be "flood" by high winds and heavy

rauns when the ears are large and the straw long as ripening draws near.

What that requires a filip should be treated with superphosphate, especially when a root crop is to follow. Harrowing and rolling wheat does much to make it grow sturdily. The stirring of the soil admits air to the roots, and the roller following close behind consolidates the soil about them, encouraging the plant to thier, increasing the number of growths and ultimately the ears of Corn.

If a few plants are pulled up in the harrowing, they will not be missed, whilst the benefit gained by an increase in vigour of the existing plants will more than compensate for the slight loss in numbers.

SHEEP'S FOOD.

Providing food for sheep is one of the most difficult problems the farmer has to deal with. The recent severe weather demoralized the fields of Swedes and Turnips, and delayed the growth of Kale and Rape, leaving the sheep almost unprovided for until they could be fed on grass. I know from experience how difficult it is to provide for a flock of 900 sheep, for if they eat grass, it will be at the expense of the hay crop.

PITTED SWEDES.

Last autumn, owing mainly to a shortage of labour and the experience of mild winters, the pitting of Swedes was almost entirely omitted. The method of pitting the roots in the field is to put them into heaps, say, of 6 bushels, without interfering with the roots or tops. They are then covered with 6 inches of soil, which does much to protect the roots from frost. The Swedes are spread over the ground a few days before the sheep are fed to them to allow the blanched tops to wilt a little, for the tops might produce savour in the lambs.

MANGOLDS.

Many large farmers who in the past did not favour the Mangold, are sowing several acres of this crop. In my opinion no root crop on the farm is more useful—the roots are always salable, and this season are worth £2 per ton. They are suitable for sheep, cows, pigs, horses and poultry, and as a crop they produce a huge quantity of food. Varieties of the Globe section give the heaviest yield. The Tankard variety are superior for sows in milk, and for fattening, as they contain most saccharine matter.

EARLY POTATOS.

Potatoes planted early in light soil where weeds are showing should be harrowed over to check the growth of the weeds, and render easier the earthing up of the plants later.

STORE CATTLE.

Store cattle wintered in yards would now be better in fields where there is even a small bite of grass. Their appearance will quickly be improved, and the shedding of their old coats expedited. If the grass is not plentiful, they may be given a few Mangolds, E. Medwynae.

THE CORN CROPS.

The condition of Wheat in France, Italy, Switzerland, and Egypt is reported to be average, and in Great Britain and the United States rather under average, while that of Rice in France, Italy, Switzerland and the United States is average. Barley in France, Italy, Switzerland and Egypt is in average condition; while Oats are average in Italy and the United States, but under average in France and Ireland.

The probable yield of Winter Wheat in the United States has been estimated at 230,365,000 cwt., or 10.7 per cent. below the corresponding production last year.

The total production of Wheat in Argentina, Australia, and New Zealand in 1916-1917 is estimated at 121,991,000 cwt., and that of Oats at 16,960,000 cwt., while the yield of Maize in Argentina and Australia is estimated at 53,670,000 cwt.

TRADE NOTE.

MESSRS. J. WEEKS AND CO. (Chelsea), having had their offices at 72, Victoria Street, commandeered by the War Office for the period of the war, have taken temporary offices at 92, Victoria Street, S. W. 1.

MARKETS.

FOREIGN GARDEN. May 5.

Plants in Pots, &c: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Araalia Sieboldii, Asparagus plumosus nanus, Aspidistra, Beronia, Cacti, Cocos Weddelliana, Cyclamen, Eranthis, Ferns in thumous, Geraniums, Liliolum longiflorum, and others.

Cut Flowers, &c: Average Wholesale Prices

Table listing various cut flowers and their prices, including Anemone fulgens, Arums, Azalea, Camellias, Carnations, Carrots, Daffodils, Gladioli, Lilies, Tulips, and others.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Adiantum, Asparagus, Begonia, Brunfelsia, Calceolarias, and others.

stammets were received from Guiney and from the Sicily Isles last week-end. It is some years since such large quantities of flowers arrived in Covent Garden from the Channel Islands. There is an abundant supply of Roses this week, and also of Darwin Tulips. These blooms arrive in excellent condition. Spanish Iris (blue) is getting more plentiful. Other colours have yet to arrive. French Gypsophila is one of the newest arrivals, but flowers from France are practically over for this season. A few bunches of Sweet Peas are arriving in very fine condition. A small quantity of Stephanotis is also reaching the market, finding a ready sale. Gardenias are more plentiful, and lower in price.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Broad Beans, Broccoli, Cabbages, Carrots, Cauliflowers, Celery, Cichory, Endive, Green Beans, Herbs, and others.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Almonds, Apples, Apricots, Bananas, Blackberries, Dates, Figs, Grapes, and others.

ANSWERS TO CORRESPONDENTS.

CROSSLIT PLANT BOXES: F. L. I. You are right in suspecting crocodile to be harmful to plant life, and you should not use the boxes you have credited for growing Tomatoes until you have charred the whole inside of the wood-work, preferably with a blow-lamp. This will serve a double purpose—it will destroy the crocodile and preserve the wood from decay. NAMES OF PLANTS: G. W. Luzula campestris (Field Hair Rush). To rid your lawn of this weed, remove as many of the plants as possible by weeding, and then give the turf a light dressing of nitrogenous manure, which will increase the vigour of the natural grasses, and in time suppress the Luzula—E. T. Matton. Aegopodium Podagraria (Goutweed). Dig up the stoloniferous root-stocks and burn them.

SELECT LIST OF BOOKS ON GARDENING

To be obtained at the "GARDENERS' CHRONICLE" OFFICE from the Librarian.

Prices Quoted are in all Cases Post Free to any part of the United Kingdom.

- Gardening, School Cottage, and Allotment, A Practical Guide to. By John Worthers. 2s. 10d.
- Glass, The Garden Under. By W. F. Rowles. Illustrated. 6s. 6d.
- Grafting and Budding, Art of. By Charles Baltet. With Illustrations. 2s. 9d.
- Grafting and Budding, The Handy Book of. By James Udell. 7d.
- Grape Growing for Amateurs. A thoroughly practical book. 1s. 5d.
- Grape, The Book of the. Together with a Chapter on the History and Development of the Value of Vines. By H. W. Ward. Illustrated. 2s. 9d.
- Greenhouse and Conservatory, Construction and Heating. By Paul N. Haddock. With 23 Illustrations. 2s. 4d.
- Greenhouse, The Amateur's. By T. W. Sanders. 416 pages, 154 Illustrations. 5s. 5d.
- Greenhouse Management, Pictorial. Edited by Walter P. Wright. Illustrated. Paper. 1s. 5d.; cloth, 1s. 9d.
- Greenhouse, The Book of the. By J. C. Tallant. Head Gardener at Sleafly Hall. Illustrated. 2s. 10d.
- Hardy Flower Book, The. By E. H. Jenkins. A descriptive and practical Guide to the Cultivation of Hardy Flowers. Illustrated. Cloth, 2s. 11d.
- Hardy Trees, Flowering Shrubs, Conifers and Evergreens. By Geo. Bancroft. A Popular Handbook of 160 pages, 50 Illustrations. Useful hints. English and Latin names. 5s. 10d.
- Herb Garden. By Francis A. Bardswell. 16 Full page Illustrations in Colour. 3s. 11d.
- Herbs, The Book of. By Lady Rosalind Northcote. 2s. 10d.
- Heredity in the Light of Recent Research. By L. Dancaster. 1s. 2s.
- Holly, Yew and Box. By W. Dillimore. 2/0 pages. 175 Illustrations. Contains the Illustrations of Hollies published in the monograph by the late Thomas Moore in the *Gardener's Chronicle*. 7s.
- Horticultural Directory, Almanac and Address Book for present year. See *Gardener's Chronicle* Horticultural Directory.
- Horticulture, A Primer of Practical. By J. Wright. 1s. 11d.
- Insect and Allied Pests of Orchard Bush and Hothouse Fruits. By F. W. Theobald, M.A. etc. 723 Illustrations. 70s. 6d.
- Insects, Injurious and Useful. An Introduction to the Study of Economic Entomology. By L. C. Miall, F.R.S. 100 Illustrations. 3s. 9d.
- Intensive Culture of Vegetables on the French System. By P. Aquinas. Illustrated. 5s. 11d.
- Iris, the Book of the. Illustrated. By R. Irwin Lynch. 2s. 10d.
- Iris, By W. R. Dykes, M.A. With Preface by Prof. Bayley Balfour, F.R.S. Contains 8 full page Coloured Plates. 1s. 10d.
- Johnson's Gardener's Dictionary. New Edition. 9s. 6d.
- Judging, Rules for. Issued by the Royal Horticultural Society. Latest Edition. 7s. 6d.
- Land of the Blue Poppy, The. By F. Kingston Wood. With Illustrations and Maps. 12s. 6d.
- Landscape Architecture, The Art of. By Samuel Parsons. A practical and authoritative work. Illustrated. 15s.
- Lawns. By Sutton and Sons. Reading. In paper cover. Well Illustrated. 1s. 5d.
- Lawns and Greens. By T. W. Sanders. A complete Guide to the Formation and Management of Lawns, Tennis Courts, etc. Illustrated. Paper. 1s. 5d.
- Lilies. By A. Grove. With Preface by H. J. Elwes, F.R.S. Contains 1 Coloured Plate. 1s. 10d.
- Lily, Book of the. By W. Goldring. Illustrated. 2s. 9d.
- Little Gardens and How to Make the Most of Them. By H. H. Thomas. A handy and useful work for the Amateur. Paper. 1s. 5d.; cloth, 1s. 9d.
- Mango, The. By G. Marshall Woodhouse. An account of its Culture and Varieties. 1s. 10d.
- Manners and the Principles of Manuring. By C. M. Atkins. 1s. 3d.
- Manures for Garden and Farm Crops. By W. Dyke. Cloth, 1s. 9d.
- Manuring, The Science and Practice of. By W. Dyke, with Introduction by J. Wright. A most practical work for the Amateur, Market and Professional Gardener. 7s. 6d.
- Manuring of Market Garden Crops, The. By Bernard Dyer and F. W. L. Shuttle. New Edition. 1s. 5d.
- Market Gardening, The Book of. By R. Lewis. Cloth. Illustrated. 2s. 9d.
- Mendelsin. By R. C. Punnett, F.R.S. New and Enlarged Edition. 7s. 6d.
- Mendel's Principles of Heredity. By W. Bateson, F.R.S. 12s. 6d.
- Mushroom Culture for Amateurs. By W. J. May. New Edition. Thoroughly revised. Illustrated. 1s. 2d.
- Mushrooms and How to Grow Them. By John F. Barty. An excellent Treatise. Illustrated. 1s. 2d.
- My Garden in Spring. By F. A. Bowles, M.A., Chairman of Scientific Committee of Royal Horticultural Society. With Preface by Reginald Farrer. "Mr. Bowles has the time to be his own gardener, and has thereby gained that first-hand knowledge of plants without which any writer on horticultural subjects is bound to be neither interesting nor informing." Price 5s. 6d.
- My Garden in Summer. By the same author. Price 5s. 6d.
- My Garden in Autumn and Winter. By the same author. 5s. 6d.
- Orchids and their Cultivation. By James O'Brien, V.M.H., Hon. Sec. of the R.H.S. Orchid Committee. Contains 3 full page Coloured Plates from colour photography. 1s. 10d.
- Orchids; Their Culture and Management. By W. Watson. Curator, Royal Botanic Gardens, Kew, and H. J. Chapman. Illustrated with 120 Engravings and 20 Coloured Plates. 25s. 8d.
- Orchids for Everyone. By C. D. Curtis. With 55 Coloured, and 45 Black and White Illustrations. 21s. 3d.
- Orchids, Fertilisation of. By Chris Darwin. Illustrated. 3s. 11d.
- Orchid Grower's Manual, The. By the late B. S. Williams. 300 pages. Numerous Illustrations. 10s. 6d.
- Pansies, Violas and Violets. By W. Cutbush and R. Hooper Pearson. With 8 full page Coloured Plates from colour photography. 1s. 10d.
- Pansies and Violets. By D. B. Crane. Paper. 1s. 2d.; cloth, 1s. 9d.
- Peach, The Book of the. By H. W. Ward. A Practical Handbook on the Cultivation of Peaches and Nectarines under Glass and Out of doors. 2s. 10d.
- Pears and Plums, The Book of. By the Rev. E. Bartram, D.D. Illustrated. 2s. 9d.
- Pines, The Genus. By George Russell Shaw. Price 2/2 1/2 6d.
- Plant Breeding, Being Five Lectures upon the Amelioration of Domestic Plants. By Prof. L. H. Bailey. Illustrated. 3s. 11d.
- Plant Life. By C. A. Hall. £1/8s. 6d.
- Practical Plant Physiology. By Frederick Koehle, F.R.S. Illustrated. 5s. 10d.
- Practical Tree Repair. By Elbert Peets. The Physical Repair of Trees, Pruning and the Treatment of Wounds and Cavities. Illustrated. 7s. 11d.
- Plants and Trees, Diseases of Cultivated. By George Massee. Well Illustrated. 7s. 11d.
- Plants, A Popular Treatise on the Physiology of. By Dr. Paul Sargant. Translated by F. E. Woods, D.Sc. With 53 Illustrations. 9s. 6d.
- PRESIDENT DAY GARDENING. Edited by R. Hooper Pearson, Managing Editor of the *Gardener's Chronicle*. Each of the seven (seven) volumes following contains 8 full page Coloured Plates. 1s. 10d. each.
1. Sweet Peas. (Second and Revised Edition, 1914). By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition." by Thos. Stevenson.
 2. Pansies, Violas, and Violets. By William Cutbush and R. Hooper Pearson.
 3. Daffodils. By the Rev. J. Jacob. With Preface by the Rev. W. Wilks, M.A.
 4. Orchids. By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.
 5. Root and Stem Vegetables. By the late Alexander Dean.
 6. Carnations and Pinks. By T. J. Cook, Head Gardener at Sandringham; James Douglas, V.M.H.; and J. F. McLeod, Head Gardener to the late Mr. Pierpont Morgan.

Complete New Catalogue sent Post Free on application to—

THE LIBRARIAN,
41, Wellington Street, Covent Garden, W.C. 2

To the Trade.

NOVELTIES IN CYCLAMENS.

St. GEORGE'S STRAIN.

Four New Varieties to be Sent Out in 1917.

QUEEN MARY.

Large salmon coloured flower.
Very fine growth.

ST. GEORGE.

The best Ornamental Leaved Variety.
Flowers salmon pink. R.H.S. Award of Merit.

MRS. L. M. GRAVES.

Salmon Scarlet.
R.H.S. Award of Merit.

CRIMSON ST. GEORGE.

(See Illustration.)

We also offer the following favourite varieties:—

BRILLIANT.

Extra Dark Crimson. Rich Colour, very free.

BRILLIANT—

GIGANTEUM (NEW).

A superb novelty. Very robust grower. Fiery crimson flowers of much greater size than any other of its colour.

BARONESS

BURDETT-COUTTS.

Pure White. Short broad Petals. Very free Flowering Variety. Certificated R.H.S.

CRIMSON KING.

Bright Crimson. Certificated R.H.S.

DAME BLANCH—

GIGANTEUM.

Pure White. Large broad Petals.

DUKE OF CONNAUGHT.

Giganteum Variety. Purplish Crimson.

DUKE OF FIFE.

Giganteum Variety. Dark Rose.

EXCELSIOR.

Giganteum Variety. White, with Purple Base. Extra large Flowers.

GRANDIFLORA ALBA—

GIGANTEUM.

The largest White grown. Enormous Flowers. Splendid grower. Certificated.

MONT BLANC—

GIGANTEUM.

Pure White. Large Flower. A Mountain of Snow. Certificated R.H.S.

MAUVE QUEEN.

Giganteum Variety. Delicate Mauve shade.

CRIMSON ST. GEORGE.

The sensational variety of 1917, and a grand acquisition, having the magnificent decorative foliage of St. George, with vivid crimson flower, which are produced in abundance well above the foliage. The effect is very telling, and the combination of flower and foliage will make this variety pre-eminently a favourite for table decoration, sick room, etc. Award of Merit, R.H.S.

PRINCE OF WALES.

Giganteum Variety. Bright Red, large Flowers. Award of Merit, R.H.S.

PRINCESS OF WALES.

Giganteum Variety. Deep Pink. Very free.

PAPILIO.

A charming new break. Popularly termed Butterfly Cyclamen. Mixed colours.

PICTURATUM.

Giganteum Variety. Light Rose tinted. Claret Base. Certificated R.B.S. and R.H.S.

PRINCESS MAY.

Pale Pink. Award of Merit, R.H.S.

ROSY MORN.

Giganteum Variety. Delicate Rose tinted. Claret Base. Certificated R.B.S. and R.H.S.

SALMON QUEEN.

Soft Salmon Pink.

SUNRAY.

Giganteum Variety. Deep Pink, with Claret Base. One of the Best.

SALMON KING

"OUR-OWN."

Vastly superior to any other salmon in the market.

MRS. BUCKSTON.

The Salmon Cyclamen with frilled petals.

CALCEOLARIA—

HERBACEOUS.

St. George's Giant Flowered.

SCHIZANTHUS

GRANDIFLORA

HYBRIDA.

Veitch's Strain.

ST. GEORGE'S NURSERY CO., HARLINGTON, Middlesex.

SALES BY AUCTION.

SOUTHGATE, N.

MESSRS. PROTHEROE & MORRIS will sell by auction on the premises, Southgate, Essex, by order of the Executors of the late Mr. C. H. Peeling.

On **Tuesday and Wednesday, May 15th and 16th, 1917, at 12.30 o'clock precisely,** the GREENHOUSE, BEDDING PLANTS, and Orchids, FARMING IMPLEMENTS, Horse, Cart, Rick, Clogs and Poles, Hay Rake, BROOMHAM, Harness, Rugs, Food Sheds, Fences, and Sundries.

Catalogues of the Auctioneers, 67, Cheapside, London, E.C. 2.

Teakwood Garden Furniture, comprising seats, chairs, tables, &c.; Garden Ornaments, Old and Modern; Japanese Prætor; Manufacture Gardens.

MESSRS. PROTHEROE & MORRIS will sell the above at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C. 2.

On **Friday, May 18th, at 1 o'clock,** on view two days prior and morning of sale. Catalogues on application to the Auctioneers.

BUSINESSES FOR SALE.

FOR Immediate Disposal as a Going Concern, the old-established Business of SEEDSMEN and NURSERYMEN carried on by R. P. Kot & Sons at Bassett Street, Liverpool, and the Nursery, Grassendale. Offers will be received for either the whole or separate portions of the business, and for the produce stocks of Amaranth, Cyclamen, &c.

Offers to be sent in not later than the 17th inst. For particulars and orders to view apply to the trustees, HAROLD SADDLER, of Messrs. Finney, Son & Sadler, Chartered Accountants, 31, North John Street, Liverpool.

SMALL Nursery and Florist; main road, S.E. Five self-watering Greenhouses, heated, front show house, stable, &c.; 7-roomed house. Price for Greenhouses and stock, £100. Rent £32 per annum. A. Box 15, 41, Wellington Street, Covent Garden, W.C. 2.

PROPERTY TO LET.

GLASSHOUSES to Let at cheap terms moderate, also good Ground, in large or small lots. Residence, with excellent rooms, available on the premises. Close to station and easy distance from London. Each college student professor. HORTON, Box 20, 41, Wellington Street, Covent Garden W.C. 2.

PUBLISHERS' NOTICE.

SCIENTIFIC BOOKS AND SERIALS. **JOHN WHELDON & CO.** have the largest stock in the country of Books in all departments of Science and Natural History, also Transactions and Journals of Learned Societies, &c., in sets, runs, and single volumes or numbers. Libraries or small parcels purchased for cash. SPECIAL CATALOGUES: Gardening, Botanical, Agricultural, Ornithological, Entomological, Geological, Chemical, Meteorological, &c., gratis on application. 39, GREAT OFFICE STREET, KING'SWAY, LONDON, W.C. 2. Telephone: Gerrard 132.

NOTICE.

WILL JACK LUCAS, formerly a Gardener at Holly Comf, Highgate, kindly commends at once with Mrs. Pearson, Hotel Russell-Russell Square, W.C. 1.

MISCELLANEOUS.

B. EDDY & SONS, Torleven Works, Southfleet, Greenwich.—The largest manufacturers of GARDEN NETTING in the KINGDOM. NEW STOUT and specially strong SQUARE MESH NETTING, half-inch and one-inch mesh, at 4d. per square yard. LIGHT NEW square mesh, suitable for Strawberry Beds, at 3d. per square yard.

These Nets are bound all round with stout cord, and cover their measured length and width. Any length or width supplied.

Repaired Nettings in all sizes in stock. State your requirements, and we will quote lowest prices.

Also makes of TENNIS NETTINGS, RICK COVERS, GREENHOUSE SHADINGS, WASP NETTINGS, PACKING and TARKED TWINES of all kinds.

All Goods sent by PASSENGER TRAIN, CARRIAGE PAID, on receipt of order.

FOR SALE, 8 volumes Nicholson's Dictionary at Thompson's Assistant, 6 volumes in good condition. What offers.—Reply to E. W. LEFF, Shakenham Hall Gardens, Chesham, Mariner, Salop.

Gardeners desiring their Advertisements repeated must give full particulars, otherwise no notice will be taken of their communications. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. On no account should they enter into communication with unknown correspondents who require a fee beforehand.

Advertisers are cautioned against having Letters addressed to Initials at Post-offices, as all Letters so addressed are opened by the Postal Authorities and returned to the Sender.

PRIVATE.

WANTED, HEAD GARDENER (WORKING). Lady, or ineligible Man, skilled in Vegetables and Houses. R., Berkhamstead Place, Berkhamstead.

WANTED, a thoroughly competent working HEAD GARDENER, normal staff 3, temporarily reduced owing to the war, must be active, willing, and obliging, excellent cottage on the premises, preference given to a married couple without children, or with son or daughter old enough to help in the garden, a knowledge of rough carpentry, painting, or glazing would be an advantage.—Apply, giving full particulars as to wages required, and details of previous situation, to A. F. CHARRINGTON, Esq., East Hill, Oxted, Surrey.

WANTED, GARDENER (HEAD WORKING), over 10 years military age, or exempt service; very little Glass. Also second, able to drive.—Apply, giving full particulars, to MRS. ALEXANDER, Rowhill Grange, Walmington, Kent.

WANTED, HEAD WORKING GARDENER; must be thoroughly experienced in all up-to-date Gardening Inside and Out; reference to last employer indispensable.—Write, stating age, wages, and full particulars, to MRS. NORMAN DUGDALE, Dulton Manor, Longridge, Preston.

WANTED, FOREMAN for Houses; married or single; ineligible; thorough knowledge of Fruit and Plant culture essential; cottage or Bothy. State wages.—Apply, CHARLES BLICK, Gardener, Warren House, Hayes, Kent.

WANTED, FOREMAN for Inside; private establishment, not eligible; 28s. per week; good Bothy, milk, and vegetables; 3s. per week war bonus. Full particulars as to age, experience, references, and when at liberty, to FISHER, SON & STRAY, LTD., Royal Nurseries, Handsworth, Sheffield.

FOREMAN—Wanted, at once, FOREMAN for Greenhouses; must thoroughly understand the propagation and cultivation of Orchids, Ferns, and miscellaneous flowering plants. State age, experience and wages required.—Send copies of references and all particulars to THE CURATOR, Botanical Gardens, Birmingham.

REQUIRED, a Single-handed, good all-round GARDENER, with help; ineligible; married; cottage. State wages.—MRS. SEVERNE, The Lodge, Theotford, Banbury.

GARDENER (SINGLE-HANDED) wanted for simple ground, little Glass, no Kitchen Garden; led kept.—Write or apply after 6 p.m., stating age and experience, also wages required (without cottage), to MRS. LEWIS, Spelton Towers, Bramch Hill, Hamstead Heath.

WANTED, a Good SINGLE-HANDED GARDENER—OWEN POWELL, Esq., Harner Green, Welwyn, Herts.

WANTED, Good JOURNEYMAN, also IMPROVER (INSIDE), to take duty, wages £1 and 18s., with Bothy, &c.; Sunday duty and overtime paid.—W. WENMAN, Hickleton Gardens, Doncaster.

TWO JOURNEYMEN WANTED for Glass, also one for Kitchen Garden and one for Flower Garden, &c.; must be willing and not afraid of work.—Apply, stating wages required, with Bothy, to GEO. KENT, Brocket Gardens, Hatfield, Herts.

WANTED, GARDENER, ineligible, married, no family; cottage, 4 small rooms and outhouse; wages 28s., vegetables; permanency.—WHITTING, Tillington, Gosmore, Hitchin, Herts.

WANTED, UNDER-GARDENER; non-eligible, small lodge and garden.—State age, wages, and length of character, to MRS. CHARLES SMITH, Ravenswood, Wokingham.

WANTED, MAN, for Pleasure Ground and Kitchen Garden, ineligible; single; to live in Bothy; £1 a week. Also an Improver for the Houses; 12s. per week, with Bothy, &c.—HEAD GARDENER, Long Park Gardens, Havant, Hants.

WANTED, MAN; experienced Inside; wages 7s. per week and cottage.—Apply, with full particulars, to W. GROOM, The Gardens, Upper Gatton Park, Merstham, Surrey.

WANTED, a SINGLE MAN, ineligible for the Forest, to work horse for carting, &c.; must be able to handle haystacks and build same; wages 25s. per week, with 2s. war bonus; leave at 1 on Saturdays during long days.—Apply, G. KENT, Brocket Gardens, Hatfield.

WANTED, ineligible MAN or YOUTH, to work under Gardener; a married man would be considered.—Apply, GIBBINS, Swalecote Park, Banbury.

MR. J. B. ROWELL, of "The Duffant," Sevenoaks, requires the services of a CHAUFFEUR-GARDENER (male or female). Applicants should state age, experience, and wages required.

WANTED, Discharged Soldier or Woman GARDENER, must have experience of Indoor and Outdoor work.—Send full particulars to H. S. PHILLIPS, The Gardens, Leighton Hall, Iron Bridge, Shropshire.

WANTED, strong YOUTH, age 16 to 17, for Pleasure Grounds. State wages required, with full particulars, to L. CRODOWN, Framwood Gardens, Stoke Poges, Slough, Bucks.

WANTED, YOUTH for Inside, age about 16 to 17 years. State experience to C. BARRING, Rachey Gardens, Meeter.

WANTED, strong YOUTH, 16 to 17, as Improver for Houses and Pleasure Grounds; wages 15s. and Bothy; duty and overtime paid.—STEVENSON, Woburn Place, Aylesbury.

WANTED, several YOUTHS, 16 to 17; Inside and Outside, wages 18s. per week, Bothy, &c.; Sunday duty and overtime paid; 1 o'clock Saturdays; travelling expenses paid.—C. GARRATT, Canwell Hall Gardens, Sutton Coldfield, Birmingham.

THE MARKET FRUIT GARDEN.

NO rain of any consequence fell in my district in the latter half of April, while there was absolute drought in the last twelve days of the month. Although there were fourteen days on which rain was measurable, the quantities were very small, on only one day being as much as a quarter of an inch. The total was 1.45 inch, including melted snow. Sunshine was abundant on most days, but it was not until the 15th that the temperature became warm by day, and the nights remained cold until after the 25th, when there was a slight frost. We did not get rid of cold wind from one of the northern quarters, in which it had remained nearly all the month, until the 28th.

A SPEECH IN VEGETATION.

More progress in vegetation was noticeable in the last week of April than had taken place during all the preceding part of the spring. Garden crops from seed that had remained below the surface for weeks came up suddenly, and full plants were gladly seen where there had been but little hope of them. Fruit buds on Pears, Apples, and early Cherries were also sudden in opening, so that compact clusters of blossom buds were to be seen on most varieties by the last day of April. This, however, is very late. During sixteen preceding seasons spent at my present place the cluster stage of Apples has only once been as late as April 20, while it was once as early as March 18, and has been common at or before the end of March. This year the earliest cases were noticed on April 23. The comparison is similar with Pears. As to early Cherries, they have usually been in full bloom before the end of April. The latest of fruits this season, however, is the Plum. No buds had burst, even on Black Diamond or Monarch, the earliest bloomers grown by me, by the end of April, while never before during the sixteen seasons that they failed to show full blossom about that date. One record

is as early as March 22, and there are three notices of full blossom on March 31. May Day without a Plum blossom is really phenomenal. A blossom here and there showed on May 3. Gooseberries and Red and Black Currants did not show blossom at all commonly until April 30. This is late, but not so much behind the normal conditions as are the instances of tardy fruit development given above.

FRUIT PROSPECTS.

There is a great promise of fruit here on all the varieties of Pears, and a tremendous one of most of them. Many a time nearly as fine a presentation has failed to insure good crops, but the extraordinary lateness of this year's blossoming will be a great safeguard. Moreover, the trusses of blossom buds have a bold and sturdy appearance. Nearly all varieties of Apples are also full of promise, the exceptions being chiefly cases of alternate-year fruiterers, which gave good crops last season. This year, however, is preponderantly the "on" season for such varieties, as well as for others which are not absolutely alternate-year fruiterers. Last year was an "off" season for Lane's Prince Albert, which is now densely studded with opening fruit-buds. Bramley's Seedling did fairly well with me last year, though the crop was a light one in the country at large, but the present promise is far beyond that of last season. Cox's Orange Pippin gave a light crop in 1916, but promises well at present. One orchard of Apples planted in 1909 is showing a general promise of fair fruiting for the first time, as previously only a few varieties have yielded fruit to any considerable extent. I do not expect a good crop of Plums, as some varieties give only a passable promise. Czar, Victoria, and Pot's Seedling yielded abundantly last season, but will yield less plentifully this year. Early Rivers gave a fair crop in 1916, and promises to do about as well this season. President planted in 1909 has only just recovered from having been allowed to crop too much three years ago, besides which it has suffered from brown rot. Belle de Louvain, planted a year later, has not cropped yet, and still is almost devoid of fruit-buds. It is a pity that this variety is so slow in coming into bearing, as it is wanted to replace Victoria, now discredited by its inability to silver-leaf. Monarch is the only Plum which promises to exceed its usually modest production in my orchards. Birds have hardly touched its fruit-buds, which are much more numerous than usual. Nearly all my Gooseberries have been grubbed up, in consequence of an attack of American mildew, but a small lot left are full of blossom-buds. Both Red and Black Currants look like bearing well.

It is hardly necessary to say that good shows of fruit do not necessarily lead up to good crops. We cannot have plenty of fruit without a fair abundance of blossom, but we can have the latter without being blessed with the former. Our fruit trees and bushes have all the possible troubles of the season before them, and their performance may prove far below their present promise.

BEGINNING OF THE INSECT SEASON.

Knowing that three varieties of young Apples in my oldest orchard, planted to replace some grubbed up a few years ago, included a few trees infested with aphid eggs, I made a systematic search for eggs among the mature trees on one side of them on April 6. There are eleven varieties, and I did not find a single aphid egg on any one of them. As the first row is 324 feet from the first row of the young trees containing cases of aphid egg infestation, an aphid attack upon it would be mysterious. Even if it be true that ants carry aphides from one tree to another, of which I have never seen or read any direct evidence, it can hardly be supposed that this conveyance, even by easy stages, from one row of trees to the next, would cover 324 feet. Up to the end of April no live aphid had been found on any of

the eleven varieties of mature trees, though an object resembling a dead insect was found on one burst fruit-bud. Smoker eggs, more or less, were found on all. The first aphides were found on one of the egg-infested young trees on April 21, masses of them outside the bursting fruit buds, and on wood buds right up the new shoots. They were obviously just hatched by the warm sunshine. As the trees were to be lime-sprayed on April 23, consequences were awaited with keen interest. The spraying was done, and on the 24th the infested trees were examined. All the young insects were found to be dead, and at first it was supposed that the lime-wash had killed them. Fortunately, however, two infested trees had been left unsprayed, as tests, and when those were examined it was found that the aphides on them were also dead. Now, on the night of April 25 there was a slight frost. It was only 2° as tested on three thermometers side by side, 4 feet from the ground, on a wall of my house facing the north. Possibly there might have been 3° in the orchard, as more open to the north east wind then prevailing, though the orchard adjoins my garden, and the level is no lower where the infested trees stand than the site of my house is.

The result is interesting as showing that a very slight frost is sufficient to kill newly hatched aphides. This may be taken to explain why we are nearly or quite exempt from aphid attack in some seasons, as we were last year, or at least as I was, except on a few of the young trees referred to above. There is also another point worth notice. If it had not been for test trees having been left unsprayed, the killing of the aphides would have been attributed to the lime, and probably many cases of supposed success from lime spraying are as fallacious as my supposition was, before examining those test trees. The fatality of slight frost to the newly-hatched aphides in this instance covers two species, as Mr. Theobald, of Wye College, found both *Aphis mali* and *A. pyri* (commonly called *A. sorbi*) among the dead insects sent to him.

The first Apple suckers of the season were found on April 29, on Warner's King, Beauty of Bath, and Mr. Gladstone. They were extremely small, and probably just hatched. A few thrips and two tiny caterpillars were also found.

LATE TOP GRAFTING.

In consequence of the lateness of the season it was not deemed advisable to begin the top-grafting of Apples until April 20, although there were over 200 trees of Gascoyne's Scarlet Seedling to operate upon. Even then, and up to May 2, the bark did not slip as easily as was to be desired.

SOILING LUCERNE IN ORCHARDS.

This work has been done in one Apple orchard and in part of another, in both of which bottom fruit has been grubbed up for some time. The start was on April 20 in an orchard planted in the autumn of 1900. There the trees are too much overgrown to allow of horse cultivation, and the seed, 30 lb. per acre, was sown broadcast and hoed in at once by a gang of women and two men. It is unfortunate that drought has prevailed since the sowing. Still, the seed has germinated quickly where the surface is not rough. In the other orchard the land was cultivated and harrowed up and down and across before the sowing, and harrowed after the seed was sown, women having to hoe it in only around the trees where the horse cultivation left squares. As there are two rows of Cordons down the middle of this orchard, stopping the cross cultivation at that place, only one half could be done at a time, and when the second half was cultivated the land had become so hard that it turned up in a very rough condition, and cannot be finished until rain softens the clods. This is unfortunate, as it was desired to sow the seed and get it growing as early as possible, because the start of the crop would be much more favourable before the land was partly shaded by the foliage of the trees than afterwards. *Southern Grower.*

CAMPANULA EPHESIA.

CERTAIN Campanulas are found in South-Eastern Europe and Asia Minor that have white, woolly foliage, the best known being *C. tomentosa* and *C. lanata*. *C. Ephesia* (see fig. 69) belongs to this group, and is found on Mount Ephesi in Lydia, a district of Asia Minor. The species was introduced into cultivation by Sir John Barran, Bart., of Sawley Hall, Ripon, and it flowered for the first time in this country in July of last year. The plant grows naturally in crevices on rock faces, and forms large, bushy plants, which are evidently perennial. The tomentose, silvery leaves, with sinuate margins,

charis × *nobile*) and *D. regium*, and named it *D. Alpha* in 1910. *D. endocharis* was obtained from a cross between *D. moniliforme* and *D. aureum*. The interesting point is that *D. regium*, crossed with other varieties whose ancestors bore either smaller or only equally large flowers, has, in this case, resulted in increasing the size of the flower while practically retaining intact its form and colouring. The flower is rather more than 4 inches across, the petals being $1\frac{1}{2}$ inch wide. The ground is white, tinged and veined with rosy-mauve. The lip, which has the form of *D. regium*, is sulphur-yellow in the tube, the front being coloured like the petals, but rather darker.

C. Walkeriana, unlike most other *Cattleyas*, flowers from a sheathed rudimentary process from the rhizome, which does not develop into an ordinary pseudo-bulb.

CYPRIPEDIUM HELICE.—A hybrid between *C. bellatulum* and *C. Psyche* (*bellatulum* × *niveum*) is also sent by Mr. F. C. Puddle, the raiser. As might be expected, the primary and secondary influence of *C. bellatulum* predominates, but the introduction of the soft, white *C. niveum* has made clearer the white ground, and enlarged the petals in a remarkable manner, their outline being almost perfectly orbicular, and their width ($1\frac{1}{2}$ inch) slightly exceeding the dorsal sepal. The sepals and petals are white, the upper sepal having feathered lines of claret-coloured blotches. The petals are closely spotted with the same colour, and the lip and staminode with very small, claret-red spotting. The lower sepals, hidden behind the broad petals, are white, with purple spotting at the back, and several thin, purple lines on the surface. As a flower it is much better than the spotted forms of *C. Godfreyae*.

CATTLEYA EILEEN.—Messrs. Stuart Low and Co. send a fine flower of a hybrid raised between *C. Dowiana* and *C. Carmen* (*Luddemanniana* and *Warszewiczii*). The flower is six inches across, has petals two inches wide, and a proportionately large and well-displayed labellum. The sepals are rose-purple, with a yellowish band down the two lateral ones. The petals are darker rose-purple, and the tube of the lip is of a still deeper shade. The front of the lip is deep ruby-crimson, and a series of yellow lines run from the base indicative of *C. Dowiana*, the lines being shaded with yellow on each side in a manner to be traced to *C. Warszewiczii*.

[Photograph by W. Irving.]

FIG. 69.—*CAMPANULA EPHESIA*: COLOUR OF FLOWERS PALE LILAC.

are produced in rosettes, from which spring numerous branching stems, 1 foot to 2 feet high, covered for most of their length with large, pale lilac-coloured flowers. The plant illustrated was a side shoot taken from the original plant and presented to Kew. The old plant made a fine bushy specimen with some twenty or thirty stems abundantly furnished with flowers. W. I.

ORCHID NOTES AND CLEANINGS.

DENDROBIUM ALPHA VAR. ELEANOR.

A FLOWER from a plant of this handsome and interesting hybrid is sent by Sir Jeremiah Colman, Bart., Catton Park, Surrey, who first flowered the cross between *D. euosium* (endo-

NEW HYBRIDS.

BRASSO-CATTLEYA CYNTHIA.—A flower of a new hybrid raised between *Cattleya Walkeriana* and *Brassavola Digbyana* is sent us by Mr. F. C. Puddle, gardener to W. H. St. Quintin, Esq., Scampston Hall, Rillington, Yorkshire. The flower is of medium size for a *Brasso-Cattleya*, and light rose in colour, with a darker rose veining, the disc of the lip being greenish-yellow, and delicately fragrant. The distinctly three-lobed lip of *Cattleya Walkeriana* brings about a narrowing of the middle of the lip of the hybrid which does not improve it florally, but is interesting as showing the conflict between the diverse features of the parents. *C. Walkeriana* is shown strongly in the broad, winged column. Another dissimilarity which has had to be accommodated in the hybrid is that

PLANT NOTE.

LESCHENAULTIA BILoba MAJOR.

I WAS interested to read on p. 176 that this beautiful blue-flowered *Leschenaultia* was shown at the meeting of the Royal Horticultural Society on April 24 last. Introduced from the Swan River district of Australia in 1839, the typical *Leschenaultia biloba* soon became popular as a hard-wood specimen plant, such as were at that time so generally cultivated. In the *Floricultural Cabinet* for 1845, it is frequently referred to as a feature in the groups of hard-wooded plants shown at the exhibitions at Chiswick and Regent's Park. Mention is made in the same work of a specimen 4 feet by 4 feet in Mrs. Lawrence's garden at Ealing Park, which was at that time famous for its hard-wooded plants. The improved *L. biloba major* seems to have been introduced soon afterwards, and in time to have superseded the typical form. At the International Horticultural Exhibition held in 1866, it was shown in several of the competing groups. After this date it would appear to have almost dropped out of cultivation till about 35 years ago it was brought prominently forward by Messrs. Balchin, of Brighton. Plants were grown in their branch nursery at Hantsocks that were remarkable not only for their robust health, but also for their richly-coloured blossoms. The disposal of the nursery led to the *Leschenaultia* in question almost disappearing from public notice. Another species, also extensively grown in the 40's of the last century, was *L. formosa*, with blossoms of salmon-scarlet tint. It is a weaker grower than *L. biloba*, though a specimen 2 feet high and 4 feet in diameter is referred to in the work quoted above in the notes from Ealing Park. It must, however, have gradually declined in favour, probably owing to the difficulties attending its successful cultivation.

Another species is *L. splendens*, which is stated in the *Dictionary of Gardening* to be synonymous with *L. hircina*. The flowers of this species are bright scarlet. W. T.

PRUNUS SERRULATA.

Is the wonderful succession of flowering trees that beautify the pleasures of England from April until the end of June, there are none with richer attractions than the many forms of *Prunus serrulata* which have come to us from Japan. In his recent work on the Cherries of that country, Mr. E. H. Wilson has distinguished about two dozen of these Cherries. *Prunus serrulata* was originally described and named by Lindley in 1850, in the Horticultural Society's *Transactions*, but his type specimen, now preserved at Cambridge, has no flowers. The type is, however, no doubt the low tree with a short trunk, wide-spreading branches, and double white flowers, not uncommon in gardens. Of late years many charming varieties have been imported from Japan, the flowers varying from single to double and from pure white to pink and rose. There is also a pleasing pendulous variety of recent introduction. The finest flowered forms, such as the one named after the late James H. Veitch, have blossoms quite two inches across. This variety, which has lately been reintroduced under the Japanese name "Benifugen," has rich, rosy pink flowers.

The variety illustrated in fig. 70 is one of the single-flowered forms in the collection at Kew. As may be judged from the picture, it carries a remarkable wealth of blossom, sometimes followed by a few black Cherries. The wild form of *Prunus serrulata* (as distinct from the type, which is Lindley's tree) may not be in cultivation, but, according to Mr. Wilson, it is common in Japan, south of the Nikko region, and in thickets in Western Hupoh, China.

The flowering season of the various forms ordinarily extends over four or five weeks, beginning late in April. This year when all vegetation is backward, we have not had them in April, and the season will probably be curtailed. One or more of them should be in every garden, even the smallest. The trees bloom with great regularity—one may say, indeed, that they never fail, and the flowers are rarely injured by frost. The plant thrives in a good bamy soil and a sunny situation. *B.*

ON INCREASED FOOD PRODUCTION.

FRUIT PROSPECTS AND MULCHING

J. E. asks (see p. 175): "In what way does the early mulching of Strawberries increase the risk of damage by frost?"

Because the temperature is lower *over* a mulching than over vacant dug land. This may be proved by the fact that frost shows earlier and later on the mulching than on the neighbouring ground not mulched. The same thing occurs on a lawn or grass field, and the time is visible for a longer time. Therefore the flower-spikes have to contend with more frost when the ground is mulched. Why is this? Because there is always a certain amount of warmth rising from the earth; mulching hinders this process, therefore the frost has more power.

I have often seen Rhubarb which was showing *above* the litter (most market gardeners cover Rhubarb with littery manure as far as possible) cut to pieces by the frost, while that on adjoining ground not littered suffered no damage. *Wm. Poupert, Marsh Farm, Turickenham.*

BUTTER BEANS

BUTTER BEANS are likely to be much more cultivated this season than has hitherto been the case in this country. Almost any variety of the Dwarf Bean may be utilized for the purpose; the Wax Bean, or Butter Bean, is excellent, and so is *Magnum Bonum*. The seeds of these beans should be sown at once in a sunny position. The ripe seeds should be harvested at the end of September or beginning of October, pulling up the plants and hanging them up to dry. After

drying is thoroughly assured, the Beans should be shelled and kept in a dry position. They will keep good for a long time.

CELERIAC OR TURNIP-ROOTED CELERY.

CELERIAC is one of our most useful winter vegetables, but the plant is not nearly so much grown in this country as its merits deserve. Previous to the war, Celeriac was imported in very large quantities, and realized high prices.

[Photograph by C. P. Raffin]
FIG. 70.—FLOWERING SHOOT OF PRUNUS SERRULATA.

The crop is very simple to grow, but if it is to be at its best it requires a long season of growth, and should be planted at once, on the flat, on rich ground, 2 feet from row to row and 1 foot 6 inches from plant to plant. An abundance of water should be given all through the growing season, and the surface soil stirred frequently with the Dutch hoe. The roots should be lifted and stored in sand in a shed on the approach of frost, where they will keep sound

all the winter. A trial of this vegetable was conducted in the Royal Horticultural Society's Gardens at Wisley last summer, and some very fine stocks were seen there.

CELERY.

THOUGH it is the usual custom, and a very commendable one, to prepare and plant Celery in trenches, especially for the mid-winter and spring crops, the plant can be grown successfully with much less trouble for early and late autumn supplies on the flat. The ground should be enriched with manure and deeply worked, setting the plants in beds of six or eight rows each. The roots should be well supplied with water, and fed with liquid manure. Dosing the growth frequently with fresh soot is beneficial. The stems may be blanched entirely by means of rough brown paper, thus saving an enormous amount of labour in earthing-up. The quality also is improved when the plants are blanched in this way, the "sticks" being cleaner, and seldom attacked by slugs. A further advantage is that the roots can be easily supplied with water in dry weather. *Edwin Roberts.*

POTATOS UNDER GLASS

WE have been lifting new Potatoes here for the past fortnight grown under glass in Cucumber and Melon houses. The varieties are Early Queen and Dumottar Castle. Many of the tubers weigh over half a pound each. About February 9 the houses were cleared of pot plants, and a layer of leaves was placed over the galvanised iron sheets, under which are hot-water pipes. On the leaves was put leaf-mould to the depth of four inches, and the sprouted tubers planted in this. As the plants progressed, mouldings were given with only the lead soil from the woodland, but just prior to each moulding Potato manure was applied, and the soil watered. The depth of soil when we finished moulding was about eight inches. Both varieties made remarkable growth. Early Queen averaging three feet in height, with beautiful dark-green foliage. This variety should have plenty of room, as some of the best tubers are produced at the end of roots which are sometimes a foot long.

Dumottar Castle will undoubtedly become a popular variety for culture under glass, as it is of dwarf habit, with strong stems. Another large house, 120 feet by 15 feet, is almost wholly devoted to Potatoes, which are nearly ready for lifting, the majority in the ground, others in large pots. Judging by the growth those have made, a good crop should be obtained. *T. Wilkins, Coedparhydylyn Gardens, Cardiff.*

POTATO WART DISEASE AND EDINBURGH ALLOTMENTS.

MUCH anxiety has been roused by the discovery that some Potatoes affected by the wart disease had been planted in some of the new Edinburgh allotments. The discovery was made through a woman presenting seed Potatoes, of the appearance of which she was suspicious, at the Edinburgh office of the Board of Agriculture. Investigation showed that there was no doubt of the place of origin of the affected tubers, and that about seven tons had been sold locally for seed. From this stock a portion was sold to allotment holders by an agent. It is believed that the names of all the Edinburgh purchasers have been obtained. Some of these were secretaries of allotment associations, and holders of plots who have purchased from these sources have been instructed to lift their seed Potatoes and have them examined. *S. J.*

CREDIT FOR FARMERS.

THE Board of Agriculture has authorised War Agricultural Executive Committees to arrange with various banks for loans to farmers who cannot pay cash. Practically all the leading joint stock banks have agreed to assist the scheme.

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor.

TURNIPS.—The earliest Turnips are ready for thinning, which should be done on a damp morning. Allow a space of 8 or 9 inches between the plants in the row. When the thinning has been done stir the ground with the Dutch hoe, and again on subsequent occasions to encourage quick growth. If wood ashes are available the plants will benefit by frequent dustings; soot may also be applied with benefit during damp, dull weather. Sow again for succession, choosing rich ground, allowing 15 inches between the rows. White Model and Snowball are good varieties for present sowing.

BROAD BEANS.—Longpod Beans may be sown in rich soil with a view to continuing the supply of pods as far into the season as possible. Choose a cool part of the garden, and allow plenty of space between the rows.

FRENCH BEANS.—This crop may be sown on warm, south borders where the soil is light and rich. Make the drills about 2 inches deep. When the plants show through the surface protection from frost and cold winds may be necessary, and for this purpose a quantity of light, dry material should be kept in readiness. French Beans sown in small pots now and raised in gentle warmth will be useful for planting in the open early in June.

ONIONS.—Spring sown Onions should be thinned as soon as the plants are advanced sufficiently, but do not thin them severely unless extra large bulbs are required. After thinning stir the soil lightly with the Dutch hoe, and hoe it again frequently during the growing season. Dust the plants on several occasions with soot, selecting dull days.

CUCUMBERS.—Cucumber plants in bearing will be greatly benefited by top-dressings of light, rich soil applied at intervals, first sprinkling the surface with bone-meal. Give particular attention to stopping and tying the young growths, which should never be allowed to become crowded, for the removal of large quantities of foliage at one time would result in a severe check to growth, and affect the supply of fruit. Syringe the plants twice daily, and close the ventilators early in the afternoons. A night temperature of 70° or 75° is suitable. Make another sowing to provide plants for successional fruiting; it is better to make a new plantation than to retain old plants when they are past their best condition.

TOMATOES.—Gather Tomato fruits before they become over-ripe and place them in a cool store room. Stimulate the plants with liquid manure to assist them to develop the remainder of the crop. Successional plants should be top-dressed with fine soil mixed with concentrated fertiliser, pressing the soil on the surface of the bed. Remove the side shoots. Tap the trellis several times daily in order to distribute the pollen. Plants in beds may be allowed plenty of head room, but pot plants should be stopped after a sufficient number of trusses has formed, for only a limited number of fruits will ripen before the food contents of the pot become exhausted. Young plants should be potted up and grown in a well ventilated house.

POTATOES IN PITS.—Early Potatoes growing in pits should be ventilated freely, and never allowed to suffer from want of water at the roots. Open the lights a little at night in order to secure stocky growth; on mild days the lights may be removed altogether, replacing them at night. Late Potatoes should be planted as quickly as possible, allowing plenty of space for the plants to develop. Tubers intended for extra late planting should be laid out singly in a well-ventilated shed.

PARSLEY.—Make a good sowing of Parsley in drills 16 inches apart and thin the seedlings to 6 inches in the row, choosing well-prepared ground. Parsley is a deep-rooting plant, and requires rich soil. Old Parsley beds should be hoed and the soil sprinkled with soot.

THE FLOWER GARDEN.

By W. J. GRISB, Gardener to Mrs. DEMPSTER, Keele Hall, Staffordshire

YEW HEDGES.—The present is a suitable time to clip Yew hedges or specimen Yews. Plants in hedges sometimes die, causing bare patches, and this is due in most cases to lack of nourishment. A liberal mulching of decayed manure is essential to keep the trees in a healthy condition, as Yews are gross feeders, and soon show signs of exhaustion in poor soil.

BEGONIA.—Tuberous rooted Begonias started in boxes earlier in the season are ready for transplantation to 5-inch pots. If the stock is limited divide the larger tubers with a sharp knife. Place the plants in a close frame until they are established, but later admit air, increasing the amount of ventilation gradually.

WALLFLOWERS AND OTHER SPRING FLOWERS.—To obtain sturdy Wallflower plants in October the seed should be sown in rows made 1 foot apart. Certain varieties, including Ivory White, Orange Bedder, Faerie Queen and Rosy Gem germinate more readily when sown in a cold frame. A list of the best varieties includes Cloth of Gold, Fire King (orange), Giant Vulcan (crimson), Purple Queen, Eastern Queen (apricot), and Blood Red. In dry weather spray the seed bed in the evenings. The early-flowering varieties are quite hardy, and require similar treatment to the ordinary sorts. Other seeds for spring bedding to be sown at the present time include Erysimum (Golden West a capital plant for edging), E. pulchellum (a charming rock garden plant), Silene, Anemita, Double Daisies, and Sweet Williams. The Daisies and the choicer varieties of Dianthus should be sown in boxes or a cold frame. Polyanthus also are suitable for spring bedding, the Munstead being an exceptionally fine strain. Sow the seed in boxes in a compost consisting of loam, leaf mould and sand. Pansies may have similar treatment. Shade the frame until the seed has germinated, and on no account allow the soil to get dry.

PENTSTEMON.—Garden Pentstemons give flowers of a variety of colours, and may be used freely in the flower garden in place of more tender bedding plants. A liberal dressing of decayed manure and leaf mould forked into the soil will give good results. A space of 18 inches between each plant is sufficient. The variety Newbury Gem may be employed as an edging. Pentstemons require plenty of moisture.

BROMPTON STOCKS.—Plants of Brompton Stocks in pots or boxes should be transferred to their flowering quarters without delay. A distance of 18 inches between the plants will suffice. Finely ground mortar rubble or a little fine lime forked into the soil prevails to planting will be beneficial. Water around the base of each plant to settle the soil about the roots.

LILIUM.—Plants of *L. auratum*, *L. longiflorum*, and *L. speciosum* grown in pots should be in capital condition for planting out-of-doors. It is not advisable to delay their planting, or growth may receive a check when they are shifted from the pots later. Take the necessary precautions against snails.

TREES AND SHRUBS.—Let recently-planted trees and shrubs have liberal supplies of water until the roots are well established. To conserve the moisture present in the soil apply mulchings of decayed leaves and litter. Rhododendrons must not be allowed to become dry at the roots. A liberal mulching of farmyard manure will soon alter the appearance of any that do not appear to be prospering. Ribes, Jasminum nudiflorum, Forsythia and other spring flowering shrubs should have the weak growths removed immediately after flowering.

HERBACEOUS BORDERS.—Some of the early-flowering herbaceous plants will need staking and thinning. Pyrethrums should receive attention before they become twisted or broken by the wind. Such plants as Chrysanthemum maximum, Asters, Phloxes, Heleniums and Helianthus will require to be thinned, removing the weaker shoots. If these weak growths are pulled out and not cut off they will give no further trouble. The severe frost this winter has killed all the Tree Lupins at Keele; their vacant spaces will be filled with Dahlias.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR DAVEY, Abbots Wood, Godalming, Surrey.

WATERING NEWLY PLANTED TREES.—Newly planted trees, and especially those against south and south-west walls, will require watering in dry weather. Newly planted trees in other positions are also liable to suffer at this season from an insufficient supply of moisture. The rainfall this spring has been much below the average, and most of the rain and snow has come from the north, so that trees in south aspects may be dry at the roots. Most kinds of fruit trees are showing well for blossom.

RASPBERRIES.—Remove all stray suckers from Raspberries by means of a fork, and only retain those in close proximity to the stools. By pushing a fork under the sucker it may be removed easily without disturbing or damaging the main roots. Tread the ground firm after the operation. If the plants have not been mulched this should be done forthwith. If manure is not available sprinkle bone meal and Clay's Fertiliser along the rows. A little stimulant applied now will enable the buds to develop into vigorous growths that will bear good fruits.

STRAWBERRIES.—Use the hoe freely between the rows of Strawberries on fine days to destroy seedling weeds, which at this season increase rapidly, and more especially on light, sandy soils. When the soil is clear of weeds scatter a little fresh slaked lime or soot, or both, on the soil to destroy slugs and other insects. Get ready a quantity of clean straw for placing along the rows to keep the berries clear of the soil. Examine the netting and poles used against birds, and make what repairs are necessary.

HARDY VINES.—Vines out-of-doors are breaking freely, and should be regularly disbudded, leaving only one strong shoot to a spur. The Vine is now generally grown in this country for its fruit, but the plant is exceedingly ornamental, and the foliage gives fine autumnal colourings. In warm seasons crops of very good fruit can be obtained provided the requisite attention is paid to thinning the bunches and stopping the laterals. The roots should be afforded rich top-dressings and plentiful supplies of water and liquid manure.

CHERRY TREES.—Keep a sharp watch on Cherry trees for insect pests, as the season is late and the trees will undoubtedly grow quickly. The early shoots are very liable to attacks of aphid, which spreads rapidly. As soon as the flowers are over spray with Quassia Extract, wetting every portion of the tree. If the pest appears before the flowers are over there need be no hesitation in spraying, but it must be done gently. The liquid should be used in a luke-warm condition, and if the weather is favourable can be applied twice in one day, for a second spraying quickly following the first gives the pest no time to recover.

PEACHES AND NECTARINES.—These fruit trees are passing out of bloom and need care and prompt attention in the removal of all useless growths. At this season growth is often stunted by green and black aphid, which should be destroyed quickly. Remove all frontal shoots and those ill-placed; on no account leave a greater number of shoots than is required for next year's cropping. There has been no rain for 16 days, and trees trained on south walls and growing in sandy soils may need moisture.

(Photographs by H. N. King.)

COPPED HALL, ESSEN, THE RESIDENCE OF E. J. WYTHES, ESQ.

PLANTS UNDER GLASS.

By J. G. WERTON, Gardener to Lady Northcott, Eastwall Park, Kent.

RICHARDIA ELLIOTIANA and **R. ANGSTILOBA PENTLANDII**.—These yellow-flowered Arums provide a pleasing change to the usual flowering plants in the greenhouse and conservatory. They need somewhat different cultivation to that given to *Richardia africana*, commonly known as the White Arum. The foliage dies away in the autumn, and water is not required by the plants during the winter, merely storing the dried corns in a warm house, as is usually done with *Caladium*. In the spring, before growth starts, the old soil should be shaken away and the roots re-potted in $\frac{1}{2}$ or 6 inch pots, according to their size. Grow the plants in a warm house, merely damping them lightly to supply moisture until the roots become active, when water should be given. Let the plants have a little stimulant when the spathe appears, and when the flowers are fully open remove the plants to a cooler and drier house to preserve the blooms.

IVY-LEAVED PELARGONIUMS.—Few plants are superior to the Ivy-leaved Pelargonium for giving a succession of flowers over a long period in the greenhouse. The plants are making rapid growth after their winter rest. If large specimens are desired, select a number of the best plants, pot them on, and grow them steadily in a light house. After the plants are re-established, let the plants have an abundance of air, and grow them in full sunshine. Pinch out the blossoms and the joints of the shoots for a few weeks, in order to obtain good specimens. The plants may be trained in various shapes, for instance, as loose pyramids or standards.

VENTILATING AND SHADING.—The majority of plants in the glass houses are making new growth, and the ventilation and shading of the plant houses calls for unremitting care and attention. Brilliant sunshine is often accompanied by cold winds, and extreme caution is required when ventilating plants of tender growth. The inexperienced often allow the temperature to rise too high before ventilating, then, taking alarm, throw the ventilators wide open, thereby causing an influx of cold air. The cold draught checks the growth of the plants, and often lays the foundation of ill health; it may also favour attacks of mildew. Speaking generally, ventilation at this season should be afforded as soon as the temperature commences to rise in the morning. Start by admitting a very small amount of air, and increase the quantity gradually as the temperature rises.

THE PLANT STOVE.—The temperature of the plant stove should range between 65 and 70 at night. Ventilate the house slightly when the temperature reaches 75 to 80, increasing the amount of fresh air a little if it rises beyond 80. The blinds should be lowered as required for the particular occupants of the house, but not unless the temperature will maintain itself at 75 to 80. The house should be closed at a point in the afternoon so that the temperature will reach 85 with sunlight, thus keeping the house warm until late in the evening and economising fuel. At the time of closing the houses syringe the plants overhead and damp the walls, floor, and the space under stages, as a damp atmosphere favours a healthy growth and restricts insect pests. Always prevent an arid condition in the plant houses.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Ganton Park, Reigate.

MAXILLARIA.—Plants of *Maxillaria venusta*, *M. candida*, *M. picta*, *M. Turneri*, *M. Mooreana*, *M. striata* and others that are rooting freely should be re-potted if they need larger pots. If repotting is not necessary, remove some of the old soil and replace it with fresh compost. *Maxillarias* develop numerous small roots, and require plenty of surface space. Pots or pans are the most suitable receptacles for those mentioned, and they should be half filled with drainage material surfaced with a layer of Sphagnum moss. The compost should consist of equal parts Osmunda

fibre and Sphagnum-moss, divided into small portions, with sufficient crushed crocks to render the soil porous. *Maxillarias* require an abundance of water while in active growth, but the roots soon decay in a close, stagnant soil. *Maxillaria Sanderiana* and *M. Lindenii* are best grown in oak-wood baskets, as the flower-spikes sometimes push through the bottom of the receptacle. For this reason Fern rhizomes should be employed instead of crocks for drainage purposes. These two species, together with *M. fuscata*, *M. Hubschii* and *M. varinata*, should not be re-potted until after they have finished flowering. All the species mentioned require an intermediate house temperature.

LYCASTE.—The flowering of *Lycaste Skinneri* and its variety *alba*; *L. Billiae*, *L. Lucanii*, *L. Gutturiae*, *L. leucantha*, *L. Costata* and others, is finishing, and roots are growing from the base of the young shoots. At this stage of their development the plants should be either top-dressed or re-potted. Healthy specimens that have become pot-bound should be afforded larger receptacles that will accommodate the roots for at least two years. Those in a bad condition with sour compost should be taken out of their pots, the roots cleaned of all the old materials by washing, and re-potted in comparatively small pots. Plants that have sufficient rooting space, and compost in good condition, should not be re-potted, but portions of the old soil removed from the surface and replaced with fresh compost. In re-potting, the pots should be filled to one-third their depth with material for drainage. Make the soil firm and arrange it to within half an inch of the rim of the pot. Water the roots sparingly for a time, but later, when the receptacles are filled with roots, they will require more moisture. When growth is completed, only sufficient water is needed to maintain the pseudobulbs in a plump, rigid condition. At that stage the plants should receive an increased amount of sunlight to ripen and consolidate the pseudobulbs, and then kept on the dry side until the flowers begin to develop. During their growing season, *Lycastes* should be syringed overhead on frequent occasions. Scale insects are sometimes troublesome, and must be kept in check. A suitable compost for *Lycastes* consists of two parts rich fibrous loam, removing the smaller particles, and the remaining part a mixture of fibrous peat or Osmund fibre, half decayed Oak leaves, and Sphagnum moss, cut into rather short portions, adding sufficient crushed crocks and silver sand to keep the mixture porous. During the summer the plants grow well in a shady position in the Odontoglossum house, but they should be removed to the intermediate house for the winter.

FRUITS UNDER GLASS.

By JAS. HUNTER, Gardener to Mr. EDWARD DE ROTHSCHILD, C.V.O., Gunnersbury House, Acton, W.

NEWLY PLANTED VINES.—Young Vines that were planted a month or so ago are commencing to grow freely, and with more genial weather it will be safe to increase the temperature of the house both by night and by day. Make a point of closing the ventilators early in the afternoon to take advantage of the sun's heat, and thus economise fuel. Should the temperature fall to 60° or thereabouts in the morning no harm will result. Syringe the Vines freely, both in the morning and afternoon, with water that has stood in the house for a few hours. If there is no water tank in the house use a tub, and place in the tank or tub a sack bag or old stocking leg filled with soot, weighted so that it falls to the bottom. Do not disturb the bag of soot; all that is needed is that the water should taste somewhat bitter, and be of a cloudy appearance. On one occasion my Vines dropped their leaves at the points of the shoots when the foliage was quite small. This was caused by a very minute spider, not the red kind, but the use of soft-water soon destroyed the pest. Keep the young leading growths tied to the wires sufficiently to keep them straight, and pinch the laterals at the first joint. If this is done, the force of the syringe will not harm the tender growths. The latest Vines

are in active growth, or approaching that condition. See that the shoots are disbudded in good time, but do not tie them to the wires until the danger of them breaking at the base is over. After midday the shoots become a little wilted, and that is the best time to tie them. The shoots will stiffen in the night and morning, sometimes causing them to be forced from the stem at the base. This often happens in the variety Black Alicante and other strong growers. If in the mornings the young leaves are besprinkled with dewdrops, tap the rods to cause the moisture to drop, for with a few dull days, and little or no fire-heat, the tips of the leaves of Lady Downie's and Black Alicante would be disfigured. Vines intended for fruiting in pots next year should be placed in their final pots forthwith. Make the soil firm, and use similar compost to that recommended for Vine borders. Vines raised from eyes this spring should be re-potted before they become pot-bound.

POT FRUIT TREES IN COLD HOUSES.—Our pot trees that are fruited in cold houses are plunged in winter in a bed of coal ashes in a cold house with about 6 inches of the ashes over the pots. The pots are perfectly safe from damage by frost, and with wire covering the ventilators there is no danger of damage to the buds by birds. The trees are plunged closely together in winter to economise space, but now we are standing them apart for the season. Nearly every tree is well furnished with fruit buds, and the earliest flowers are expanded. We place a hive of bees in close proximity to the house, and I notice to-day that the bees are already busy amongst the trees. Close attention must be given to watering, and a keen watch kept for the presence of aphid.

POT TREES WITH FRUITS SWELLING.—The fruits on the earlier Cherry, Peach, Nectarine, and Plum trees have set abundantly, and require thinning freely. For Cherries and Plums I prefer to use a pair of Vine scissors. Leave a margin above what will be required for a crop in case some of the fruits fall. Cherries sometimes turn yellow and drop, but almost all danger from this cause is now past. As a precaution against damage by extra bright sunshine a thin shading is necessary; we use No. 3 blind, which is drawn over the roof when necessary. This blind also serves a good purpose in keeping ripe fruit from shrivelling. Fire heat is not needed now for Cherries, and the valves of the water pipes have been turned off for a fortnight. The house is ventilated both at the sides and top, for a cool night temperature is in accord with the requirements of the Cherry. The earliest fruits are already showing colour. Plums, too, are looking very well. These fruits receive similar treatment as regards temperature and ventilation to Peaches and Nectarines. We have a full crop, especially of Early Transparent Gage. I noticed a little Plum aphid recently, but the pest has been checked. The crops of both Peaches and Nectarines require much thinning. We shall now expedite the work of top dressing the trees in every instance. A little warmth is still maintained in the water pipes, but it will soon be dispensed with unless the weather turns wet.

FIGS IN POTS.—Our pot Figs are still crowded, and not until the earliest fruits are ripe and the trees cleared outside will more room be available. The Cherry house will, as usual, be the first compartment to afford relief, early in June.

INARCHING VINES.—Inarching is better than grafting with the old wood in the case of the Vine. The operation is easily performed, and almost always with certain success. Select a suitable spur at the base of the Vine as the stock and choose the best possible shoot from the variety to be inarched. This will most likely be of a Vine in a pot. Bring the two young shoots into contact, first cutting away about half of the shoot in each instance, and about 3 inches or a little more in length, cutting it to the pith in each case. The two shoots should be of nearly the same diameter. Having thus fitted the two shoots together bind them together tightly with soft raffia. Stop the leading growth of the stock and after a month or so, if the raffia is seen to be too tight, let it be loosened.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary Department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication.—As well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 52.8°.

ACTUAL TEMPERATURE:—Gardener's Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, May 10, 10 a.m.: Bar, 53.5, temp. 61.0. Weather—Cloudy.

SALES FOR THE ENSUING WEEK.

TUESDAY AND WEDNESDAY.—Greenhouse, Bedding Plants and Orchids, Farming Implements and Sundry Effects at Southgate House, Southgate, by Proberts and Morris, at 12.30.

FRIDAY.—Teakwood Garden Furniture, Garden Ornaments and Japanese Dwarf Trees, at 67, Chesepide, E.C., by Frodshere and Morris, at 1 o'clock.

Under the War Lands Cultivation Order, large areas of land have been brought under spade cultivation in this country for the production of food crops, and the land has been divided into allotments usually of ten rods each. Where suitable land existed and could not be obtained in the ordinary course, the local authorities were given the power to take possession and mark out the plots to meet the demand.

But the tenancy under this Order is for less than two years, and therefore differs entirely from holdings under the Allotments Act. Such a tenancy is far too short to enable the cultivator or the nation to obtain the best results from the allotments. Much of the land was formerly old pasture, and the holders have had to work hard to reduce it to a condition of reasonable fertility. It is felt that as the work is being done in the first place on behalf of the nation, and in the second place on behalf of the allotment holders themselves, they deserve better conditions of tenancy, so that during the third and fourth years they may produce abundant crops without the enormous physical effort expended in the first year.

The rent generally charged appears to be fairly good, consequently the landlords will not suffer any material loss if the tenancy was extended to three years, or

until two years after the declaration of Peace, with due consideration to the acquisition of the land under the Allotments Act at the expiration of that period. A report has appeared to the effect that cultivators of small allotments are guaranteed occupation until January 1, 1919. This is good news so far as it goes, and, if true, it provides the thin edge of the wedge, so that a little hammering should secure the larger and more reasonable extension desired.

The causes which have combined to create the present shortage of food need not be detailed here further than to state that the war has withdrawn a very large proportion of the labour from farms, market gardens, and private gardens. The conveyance of men, munitions, and material to the various theatres of war is a severe tax upon our shipping, causing a reduction of food imports, which is accentuated by the U-boat piracy. However soon the war may end, the release of shipping for food importation and the release of labour for food production at home will not put matters right at once, nor, indeed, for a long time to come. Many nations are engaged in the war, and have not produced foodstuffs at the pre-war rate for a long time, consequently plentiful importations of food cannot be expected until two or three harvests after the war.

It follows, therefore, that everyone who produces food by cultivating land during spare time will be contributing to the re-establishment of prosperity after the war ceases. Other pleas might be put forward for the extension of the tenancy of war-time allotments, such as the healthfulness of gardening, the advantage of fresh vegetables, cheaper food, and the opportunity it would afford for an extension of intensive cultivation to supplement the crops resulting from farming.

It seems desirable, therefore, to bring pressure to bear, if pressure is needed, upon the Government to secure an extension of the lease which will give security of tenure for three years, or until two years after the war ceases. Such pressure can be exerted through local horticultural and allotment societies, and by writing to members of Parliament drawing their attention to the subject. The Royal Horticultural Society, the Royal Caledonian Horticultural Society, and the Royal Horticultural Society of Ireland could exert a powerful influence in the right direction; and, finally, the Horticultural Department of the Board of Agriculture might, without pressure from outside, bring its influence to bear upon what is undoubtedly an important matter, and one which is greatly exercising the minds of thousands of war-time gardeners.

SUPPLEMENTARY ILLUSTRATION.—Those of our readers who have had the privilege of visiting the beautiful gardens at Copp'd Hall, Epping, the residence of E. J. WYTHES, Esq., will be grieved to learn that the mansion was completely destroyed by fire on the 6th inst. The outbreak was discovered early in

the morning, and though fire engines quickly arrived on the spot, the conflagration became uncontrollable. A large proportion of the contents of the mansion was saved, but the building itself was destroyed. We publish with the present issue a supplementary illustration of the building recently destroyed, and of a portion of the grounds, including part of the formal gardens, for which Copp'd Hall is famous. Though the mansion is not of great antiquity, the garden is that of a former residence, built on the same site as the present one, for Sir T. HENEAGE, in the reign of QUEEN ELIZABETH.

TRIAL OF FLOWERING STOCKS AT WISLEY.—On the 4th inst. a deputation from the Floral Committee of the Royal Horticultural Society visited Wisley to make an inspection of flowering stocks. There were something like 180 lots, and twelve plants of each lot, all in pots. The plants evidence of first-class cultivation, great credit being due to Mr. WILSON, in whose care the plants have been from the first. A further inspection will be made on the 17th inst., and on the same day a trial of *Myosotis* will also come before the Committee for award.

ALLOTMENT HOLDERS AND THE CINEMATOGRAPH.—A day or two ago we had the privilege of inspecting a series of cinematograph pictures representing some of the principal operations in the cultivation of the popular vegetable crops. It appears that the Topical Press Agency applied to the Horticultural Director of the Food Production Department, for facilities to obtain a film which would be of educational value. The Director recommended them to go to Wisley, where they found the R.H.S. most willing to afford them every opportunity for taking the photographs. The film is very satisfactory, especially the first picture, which shows a man digging the soil—a cleaner digger one would not wish to see. Following this are pictures representing the planting of Potatoes, the spraying of the haulms against disease, earthing-up the plants with the draw hoe, and finally, the lifting of the new tubers. Of these pictures perhaps the weakest is that representing the spraying, as the leaves are sprayed merely on the upper surface. The hint should have been conveyed that the underside is in no less need of treatment. The remaining pictures include the preparation of a trench for Celery, the drawing of drills for Cabbages, and the planting of the Cabbages. It is proposed to get the film into as many theatres as possible, and we are quite sure that many allotment holders who are cultivating ground for the first time will obtain many useful hints. The exhibition of the whole film occupies about seven minutes.

KEW GUILD.—The annual general meeting of the members of the Kew Guild will be held in the Lecture Room, Royal Gardens, Kew, on Saturday, June 2, at 5 p.m.

INTERESTING PLANTS AT KEW.—The *Baffodils* and early flowering trees and shrubs at the Royal Gardens, Kew, are now very attractive. During the recent bright days, visitors have been numerous, and we understand that on each of the last two Sundays a sum of about £50 has been taken at the turnstiles. The beautiful colouring of the unfolding Beech leaves, with the springing Blue-bells as a carpet, furnish a most charming effect. In the Temperate House a tall tree of *Davidia involucreata* is covered with the large pendulous bracts which form the conspicuous part of its inflorescence. A large plant of *Puya coerulea* at the Mexican end of the house carries four spikes of expanded flowers, erect, campanulate, deep peacock blue, each holding a large quantity of nectar. *Strelitzia Reginae*, the gorgeous Pelican Flower, is in full bloom. A close neighbour is *Yucca Tree-leaved*, a paniculate, holding erect its densely-branched spike of creamy-green tinted blossoms. The *Franciscas*, of which there are numerous

examples in full bloom, add their rich blue colouring to the general effect.

RHUBARB LEAVES AS SPINACH.—*The Times* of the 9th inst. gives a report of the inquest held at Enfield on the body of the Rev. WILLIAM ROBERT COLVILLE, Enfield. The coroner said there was reason to fear that Mr. COLVILLE'S death had been caused or accelerated by eating Rhubarb leaves cooked as a vegetable. There had been statements in the Press recommending the use of Rhubarb leaves in the same way as Cabbage or Spinach. So far as he could find out, there was not at present available any note of the analysis of Rhubarb leaves. An exhaustive analysis was to be made by the Home Office analyst, and until the result was made public he would advise people to leave Rhubarb leaves alone. It was stated in evidence that the Rhubarb was eaten by Mr. COLVILLE'S family for Sunday's dinner, and in the evening all the family complained of sickness and abdominal pains. Mr. COLVILLE suffered the most, complaining of violent abdominal pains whenever he moved. He was treated by his own doctor for three days, but not improving, he was taken to the hospital, where he died. The inquest was adjourned until the 26th inst. for the report of the Home Office analyst. It is interesting to note that exactly seventy years ago, namely, in May, 1847, a shortage in green vegetables led to a discussion of the question whether the leaves of Rhubarb could not be used to supply the deficiencies in Cabbage and Spinach. A correspondent in *The Lancashire Chronicle* of May 8, 1847, states: "I have several times eaten the young leaves of the Rhubarb plant dressed as Spinach, and also the flower buds plainly boiled as a vegetable, without experiencing therefrom any sensible ill-effects. This, however, affords no criterion by which to judge of the results produced on others." Another correspondent testifies to having "cooked some (i.e., buds) and eaten of it without the least ill-effect, . . . cooked as Broccoli." However, in view of the results which ensued in Mr. COLVILLE'S case, we think our readers will be well advised to await the Home Office report before indulging in this particular form of economy. In any case, very young leaves would be less likely to cause trouble than those more mature.

HISTORIC TREE.—Under the heading of "Trees with a History," Signor ETORIO MONTINI contributes an interesting article to the *Domenico del Corriere*. Paris possesses a living record of the proclamation of Italian unity. At the de Vilhiers Gate, between the Customs office on the left side pavement, a superb Elm raises itself towards the sky. It was planted 56 years ago, in March, 1861, when VICTOR EMMANUEL, King of Sardinia, became King of Italy, after the battle of Solferino. Seriously wounded during the battle, he was constrained to remain some length of time in Lombardy. On departing he took with him, as a memento, an Elm plant. This was re-planted at Paris and carefully tended.

WAR ITEMS. We regret to announce the death from wounds received in action of THOMAS YOUNG, eldest son of Mr. JAMES YOUNG, superintendent of the Royal Zoological Society's Gardens, Regent's Park. Deceased was a member of the staff of Messrs. HENNER AND SONS, Houndsditch, for almost twenty years. Death took place on the 18th ult. Mr. YOUNG'S youngest son is also serving with the Colours in France, where he went in August, 1915.

The following letter has been received from the Rahlleben Horticultural Society, acknowledging a consignment of vegetable seeds recently sent to the Rahlleben Prisoners' Camp by the Royal Horticultural Society: "Your consignment of vegetable and flower seeds sent through the Central Prisoners of War Committee has arrived here in good condition, and I wish to thank you, and through you the donors, for these acceptable gifts. You will be in-

terested to know that our arrangements for the renting of the ground for the vegetable garden have been satisfactorily concluded, and that we hope very soon to commence trenching the ground, which, owing to very severe frost, we have not yet been able to do. In the meantime, work continues in our nursery, where we already have a large stock of seedlings nearly ready for planting out. Again accept our warmest thanks for your gifts.—**RHLLEBEN HORTICULTURAL SOCIETY.** (Signed) T. HOWAT, Hon. Sec."

News has been received that Private WILLIAM M'LAHLAN has been killed in France. He was a gardener in the employment of the Right Hon. A. J. BALFOUR, M.P., at Whitting, home. Private M'LAHLAN leaves a widow and two children.

Lance-Corporal A. DOUGLAS has been wounded in the fighting at Gaza. He served his apprenticeship as a seedman with Messrs. T. KENNEDY AND CO., Dumfries.

We regret to record the death of RILEY GEORGE CHARLES PRATT CUTHBERT, F.R.S., eldest son of GEORGE and ELY CUTHBERT, "Ashleigh," Southgate, N., aged 27. Deceased died on May 2 from wounds received in action.

PUBLICATIONS RECEIVED.—*The Pruning Manual*, by L. H. BAILEY. Revised edition. (New York: The Macmillan Co.) Price 8s. 6d. net.—*Food, Fruit, and Flowers*. By Walter P. WRIGHT. (London: J. M. Dent & Sons, Ltd.) Price 5s. net.—*A Census of New South Wales Plants*. By J. H. MAIDEN and the late ERIC BETHGE. Supplement I. Fresh-water Algae. By G. J. PLAYFAIR. (Sydney: W. A. Gullick, Government Printer).—*Vegetable Culture for All*. By "Eva". (London: Herbert Jenkins, Ltd.) Price 2s. net.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

BOTTLING GREEN PEAS.—I enclose a recipe for bottling Green Peas which I copied from a weekly newspaper. "Shell the Peas, and give them a slight boil. Drain on a sieve, and pound the peas in a little of the water in which the Peas were boiled. Strain the puree which comes from the pods, and boil it with as much water as will cover the Peas when bottled, adding a little salt. Put the Peas into bottles or screw-top jars, pour the water over them, and when cold tie down." I have always understood that the bottling of Green Peas was a difficult operation, yet this recipe seems simple. It would be interesting to know if any reader has tried this method with success. D. C.

SPRING FLOWERS AT HINTON ADMIRAL.—At the present time there is one of the most displays of bulbs naturalised in grass that one could wish to see at the seat of Sir G. MEYRICK, Bart., Hinton Admiral House, Christchurch, Hampshire. The pleasure grounds being very undulating, are most suitable for this style of planting. The Daffodils are magnificent, and their colours well blended. The blue Anemone apennina is planted in masses at the foot of a large tree, and there are large clumps of Erythronium Dens canis (rose), Fritillaria Mel egris in variety, and Muscari botryoides in the dells. The rock garden adjoining is becoming bright with masses of Primula denticulata, P. rosea, and various Aubrietias. The severe winter has destroyed some of the choice plants in this lovely rock garden. In the glasshouses is a collection of extremely healthy and vigorous Perpetual-flowering Carnations, and one plant house is devoted to Pelargonium Florinda grown in pyramid form in 3 inch pots, and magnificently flowered. Well-flowered Cyclamen giganteum and a fine batch of Primula obconica grandiflora in various colours, are other good features. Visitor.

SIGNS OF SUMMER.—The cuckoo arrived here on Monday, April 30, which is much later than usual, and swallows on Wednesday, May 2. J. Batters, Gillingham, Norfolk.

SOCIETIES.

ROYAL HORTICULTURAL

MAY 8.—The fortnightly meeting of the Royal Horticultural Society on Tuesday last was by far the most successful held in the Drill Hall this year. The building was filled with exhibits of a miscellaneous character, and the attendance was the largest for many months past. Collections of Daffodils constituted the chief feature of the show, and clearly demonstrated the success which has attended the efforts of hybridisers to obtain improved form, more brilliant colouring, and other desirable qualities. The Narcissus Committee recommended four Awards of Merit to novelties and awarded six Medals to collections.

The groups before the Floral Committee were very numerous, and the general standard of quality good. The principal subjects were Roses, Carnations, Calceolarias, Auriculas, Schizanthuses, Ferns and hardy plants. As at the last meeting, Mr. ELSHA J. HICKS contributed some exceptionally well-grown Roses, chiefly varieties of his own raising. Those who have complained that some of the modern Roses completely lack the sweet scent of the older varieties will appreciate the varieties Mrs. G. C. NORWOOD and Mrs. ELSHA HICKS, both of which are well perfumed, as well as possessing first-rate colour and form. The white cluster Rose *Sunningdown*, which was included in the exhibit, is also sweetly scented. Messrs. B. R. CART AND SONS' exhibit of these flowers, and Mr. GEO. PRINCE'S exhibit of these flowers, included a mass of the yellow Banker Rose and specially good blooms of the new Flame of Fire. Messrs. W. PAUL AND SONS showed their novelty *Scarlet Rambler*, which is so suitable for pot cultivation. The group was a large one, and provided a mass of brilliant colouring. Mr. MOX'S Calceolarias were much admired; the collection was especially rich in yellow shades, although most other colours were represented. Some of the plants carried a great wealth of bloom, and looked like large posies. Another fine florist's flower, the Schizanthus, was shown by Messrs. DOBIE AND CO. in an improved form, the two chief points of the strain being the superior colour and size of the flowers and the compact habit of growth.

No flower of modern times has made greater progress than the Perpetual-flowering Carnation. It has become a standing feature of the fortnightly meetings, and the Carnation groups contribute some of the finest colour effects. Messrs. ALLWOOD BROS.' group was composed of fine blooms of the choicest and newer varieties, and Messrs. STUART LOW AND CO. and Mr. J. C. JENNER showed also very commendable collections Auriculas, which are very late this season, were shown well by Mr. JAMES DOUGLAS, Mr. J. C. ALLGROVE, and Mr. CHARLES TURNER. Messrs. H. B. MAY AND SONS' Ferns were of their usual high quality. Mr. G. KEESWELL'S flowers of *Gentiana acuminata* attracted considerable notice, this beautiful Alpine being, as usual, in its best form. A more miscellaneous exhibit was the group of pot shrubs and climbers shown by Messrs. PIPERS, the chief feature of which was *Rosa Hugonis*, shown as weeping standard and climbing pillar Rose. Messrs. W. CRUSH AND SONS showed finely flowered plants of *Azaleas*, in addition to boxes of hardy plants. Hardy plants were also shown by Mr. G. REITH. Messrs. H. CANNELL AND SONS showed Zonal Pelargoniums.

The exhibits of Orchids still form an interesting feature of the show, and although the groups are not so large as they used to be at Vincent Square, they still represent all that is best and choicest of these beautiful flowers. Good novelties are usually forthcoming in fair numbers, and on this occasion three new varieties received Awards of Merit and one a Preliminary Commendation. In this section four Medals were awarded to groups.

There were not so many exhibits before the Fruit and Vegetable Committee, but they included one of great merit, namely, a collection of vegetables shown by Messrs. SUTTON AND SONS. The group was a very representative one, and included Broccoli Satisfaction and Snow

White, Cabbages Harbinger and April, Lettuces Ideal and Golden Ball, Potatos May Queen and Ringleader, Green Bush Marrows, fine Cucumbers, Chicory, Asparagus, Mushrooms, Radishes and Seakale.

Another interesting exhibit was that of Mr. R. STAYMAN, Panshanger Gardens, consisting of excellent heads of Cabbage Red Braes Early from a sowing made on July 15, 1916, being the earliest-heading of ten varieties sown on the same day. Mr. J. C. ALLEGROVE, showed well-kept tubs of Apples Ontario, Lord Burleigh, Northern Greening, and King of Tompkins County. Messrs. DOBBIE and Co. showed a number of varieties of Potatoes, rather an unusual exhibit in May, but appropriate in the circumstances.

FIG. 71.—SCHIZANTHUS, EXHIBITED BY MESSRS. DOBBIE AND CO.

Floral Committee.

Present: Messrs. H. B. MAY (chairman), J. F. McLeod, J. W. Mootman, J. Dickson, J. Heal, E. H. Jenkins, W. Cuthbertson, W. Howe, C. E. Pearson, C. E. Shea, A. Turner, C. Dixon, C. Elliott, T. Stevenson, H. Cowley, S. Morris, R. C. Notcutt, G. Harrow, W. J. Bean, G. Bouthie, J. Green, A. G. Jackman, and R. Hooper Pearson.

AWARDS OF MERIT.

Primula obconica Eureka. This variety is stated by the exhibitor to be a hybrid between *P. obconica* and *P. sinensis*. There is little evidence of the *sinensis* parent, although the leaf is rather more elongated than in the true *obconica*, and the foliage has a crimped edge. The flowers are of extraordinary vigour, and resemble those of *P. obconica*. They are rose

purple shaded with carmine, the best tone being developed in blooms which have been expanded for a few days; at a very early stage, and also when passing off, they are of paler hue. The eye of yellow, with a ring of purple, serves as a foil to the ground-colour of the petals. Shown by ADRIENE DRECHSS of BEDFORD, Woodside, Chimes.

Rosa Hugonis.—This is stated by Mr. E. H. Wilson to be the only yellow Rose introduced from Western China. It was first collected in the province of Szechuan by Father Hugh Scallan, who sent seeds to Kew in 1899. The plant is now fairly common in cultivation, and has frequently been exhibited. The flowers are sulphur-yellow, and very freely produced. The specimen which received the Award of Merit

GROUPS.

The following awards were made to collectors:—

Silver-gilt Banksian Medals to Mr. ELISHA J. HICKS, Hurst, Twyford, for Roses, and R. L. MOND, Esq., Sevenoaks, for Calceolarias. *Silver Flora Medals* to Messrs. B. R. CANT and Co., Colchester, for Roses, and Messrs. STUART LOW and Co., Bush Hill Park, Enfield, for Carnations. *Silver Banksian Medals* to Mr. J. C. ALLEGROVE, Slough, for Auriculas; Messrs. ALLWOOD, Bross, Wivelstield, Haywards Heath, for Carnations; Messrs. CUTBUSH and Sons, Highgate, for miscellaneous plants; Messrs. DOBBIE and Co., Edinburgh, for Schizanthus; Mr. JAMES DOUGLAS, Edenside, Great Bookham, for Auriculas; Mr. J. C. JENNER, Rayleigh, for Carnations; Messrs. H. B. MAY and Sons, Edmondton, for Ferns; Mr. G. W. MILLER, Wisbech, for hardy plants; Messrs. W. PAUL and SON (WALTHAM CROSS), LTD., for Roses; and Messrs. PIPERS, Bishops Road, Bayswater, for Clematis and shrubs. *Bronze Flora Medals* to Messrs. H. CANNELL and Sons, Eynsford, for Pelargoniums; Messrs. FRANK CANT and Co., Baiswick, Colchester, for Roses; Mr. G. KERSEWELL, Exeter, for Gentians; Mr. GEORGE PRISCE, Longworth, Oxford, for hardy plants; Mr. G. RUTHE, Fox Hill, Keston, for hardy plants; and Mr. CHARLES TURNER, Slough, for Auriculas.

Orchid Committee.

Present: Sir Harry J. Veitch (in the chair), Messrs. Jas. O'Brien (hon. secretary), W. Bolton, Gurney Wilson, R. A. Rolfe, T. Armstrong, Walter Cobb, J. E. Shill, R. Brooman-White, Frederick J. Hanbury, C. J. Lucas, W. H. Hatcher, J. Charlesworth, Pantia Ralli, Stuart Low, and J. Wilson Potter.

AWARDS OF MERIT.

Dendrobium illustre var. Florence Bartels (Daihousteianum - chrysotoxum), from Sir JEREMIAH COLMAN, Bart., Gatten Park, Surrey (gr. Mr. Collier). This is a handsome hybrid with large flowers bearing a near resemblance to *D. Daihousteianum*, but with the yellow colour imparted by *D. chrysotoxum*, which has also altered the form of the labellum. The flowers are Cowslip-yellow, with a claret-coloured blotch with radiating lines on each side of the lip, which is densely pilose in front. The spike bore seven handsome flowers. The cross was first raised by Messrs. Jas. Veitch and Sons, who gained a First-class Certificate for it in 1895. It has always been rare.

Selenipedium caudatum Sanderæ, from Messrs. SANDER and Sons, St. Albans. A fine form, nearest to *S. caudatum Wallisii* in colour, and said to be identical with typical *Cypripedium (Selenipedium) caudatum*, which is not represented in gardens. The long, dorsal sepal and lower sepals are emerald green, with cream-white blotches between the veining. The narrow petals, 2 feet in length, are also green tinged and veined with purple. The infolded lobes of the lip are white with a ring of dark spots, the pouch being greenish tinged with purple.

Ontodiada Cardinal (parentage unrecorded), from Mr. J. E. SHILL, The Dell Gardens, Englefield Green. A showy form of the *O. Coronation* class. The branched spike bore 41 flowers of good size and shape, the inner two-thirds of the segments bearing large, bright red blotches and the margins tinted with rose colour. The front of the lip is pure white and the crest yellow.

PRELIMINARY COMMENDATION.

Odontoglossum crispum President Wilson, from Messrs. ARMSTRONG and BROWN, Tunbridge Wells. A seedling form of rich colour, the inner two-thirds of the broad sepals and petals being claret-red; the margins and tips are white.

GROUPS.

Sir JEREMIAH COLMAN, BART., showed *Dendrobium illustre Bartelsianum*, lighter in the tint of the markings on the lip than the companion plant (which received an Award of Merit), and bearing a spike of ten flowers, also *Odontoglossum Thompsonianum pallidum*, with a fine spike of white flowers bearing

was grown as a pillar plant, and in the same group were plants of the same species trained as weeping standards; either form seems to suit it equally well. Shown by Messrs. PIPERS.

Schizanthus Dr. Badger's Hybrids (see fig. 71).—This is a specially fine strain of greenhouse Schizanthus, with large flowers of brilliant colouring and good habit of growth. Shown by Messrs. DOBBIE and Co.

Primula sinopurpurea. This new Chinese species has smooth, spatulate leaves 4 to 5 inches long, dark green above, with a golden farina on the under surface. The heads of six or seven blooms are borne on mealy stalks about 6 inches high. The purple colour of the flowers varies in intensity in different plants, the one which obtained the Award of Merit bore blossoms of a rich shade of violet. Shown by R. WALLACE and Co.

sparsely-distributed plum-coloured blotches of varying size.

LEONARD DIXON, Esq., Pitlochrie, St. Albans, showed *Odontia Charlesworthii* Pitlochrie variety, a fine dark red form of good shape. The well-grown specimen bore two spikes of eighteen and nineteen flowers respectively.

WILLIAM BOLTON, Esq., Wilderspool, Warrington, showed a cut spike of a form of *Dendrobium Wandium* giganteum taken from a plant of a good strain imported three years ago.

Messrs. ARMSTRONG AND BROWN, Orchard-hurst, Turbridge Wells, were awarded a Silver Flora Medal for a group of new and rare hybrid *Odontoglossums*, *Odontias*, and *Miltonias*. Specially fine were the new *Laelio-Cattleya Cudmaniana splendens*, a pure white flower having an intense violet-coloured lip with white margin; *Odontoglossum Rex var. exquistum*, white, with the greater part of the surface coloured reddish-claret and a plant of the pure white *Cattleya Skinneri alba*, with fourteen flowers.

Messrs. CHARLESWORTH AND CO., Haywards Heath, were awarded a Silver Flora Medal for a group of handsome hybrids, including a fine form of the rare *Odontia Zenobia*; the new and distinct *Odontonia Norma* (*M. Warscewiczii* × *Odm. eximium*), with handsome flowers heavily marked with claret colour, the almost circular lip being white blotched with claret-red at the base.

Messrs. SANDER AND SONS, St. Albans, were awarded a Silver Banksian Medal for a group of hybrids and rare species, specially interesting being *Maxillaria Fletcheriana* and *Lycostes Janet Ross*, a fine primrose-yellow flower with minute rose spotting.

Mr. C. F. WATERS, Balcombe, was awarded a Silver Banksian Medal for a group of *Dendrobiums*, including white and coloured varieties of *D. nobile* and showy hybrids.

Messrs. SEVANT LOW AND CO., Jarvis Brook, Sussex, sent *Brassia Cattleya speciosa grandis*, a large fls. tinted flower, and *Cymbidium Debra flava*.

Narcissus Committee.

Present, Mr. E. A. Bowles, in the chair, Miss Willmott, Mr. R. O. Backhouse, Rev. J. Jacob, and Messrs. W. Poupard, J. Dun in Pearson, W. F. M. Crawford, J. T. Bennett, Pog, F. Herbert Chapman, Herbert Smith, Henry Backhouse, R. W. Wallace, W. B. Cranfield, G. W. Leak, P. R. Barr, Geo. Monro, jun., and Chas. H. Curtis (hon. secretary).

AWARDS OF MERIT

Narcissus Queen of Dawn. A very shapely Bellini variety (3b), with overlapping perianth segments of a soft creamy shade with a tinge of pink, and a brilliant orange-red cup that is exquisitely frilled. The award was made as a show variety. From Messrs. BARR AND SONS.

Narcissus Vintage. A splendid hybrid derived from the variety King Alfred and *Narcissus velutinus*, the former being the seed parent. The colour is wholy rich citron yellow; the perianth is flat and shapely, and the large trumpet is very slightly frilled at the margin. The flowers are large and drooping, so that in form, habit and colour it is particularly graceful. The award was made as a show variety. Shown by Messrs. H. CHAPMAN, LTD., Rye.

Narcissus Helios. A giant flower, even among the newer giant *Loddii* varieties. The cream white flowers measure 5 in. in diameter, the overlapping segments of the perianth, while the bold trumpet is of similar colour, frilled at the mouth, and with a green base. Award made for show purposes. Shown by Mr. W. B. CRANFIELD, Earfield Church, Middlesex.

Narcissus polyanthus crantus plenus. From a descriptive point of view there is little to be said about this *Daffodil* beyond that it is pure white, scented, and the double form of compact. But to market growers and others the variety will be of special interest, because it flowers so much earlier than the old double poetics. The growth appears robust and free. Award for show purposes, too few flowers to secure an award for market use. Shown by Messrs. J. CURTIS AND SONS.

Groups.

Mr. J. K. RAMSBOTTOM displayed a series of specimens and photographs prepared by him at

the R.H.S. Gardens, Wisley, illustrative of a disease of *Daffodils*. Mr. Ramsbottom has produced badly diseased bulbs in eight weeks after inoculation by *celworm* on both flower-stem and leaves. One little tube contained about 3,000 *celworms*, and these looked like the fine atoms of dust to be seen floating in a beam of sunlight when it enters a darkened room. (Silver-gilt Banksian Medal.)

Messrs. R. H. BARR, LTD., Wisbech, were awarded a Silver-gilt Flora Medal for a representative collection of *Narcissus* arranged in the style. Good seedlings were shown in considerable numbers in addition to named varieties. Of the seedlings an improved *Lord Roberts* won a great deal of admiration, while a neat white flower with a pinky-green eye looked like a new type of poetics.

A large and beautiful exhibit of *Daffodils* from Messrs. J. R. PEARSON AND SONS, Loddham, Notts., was remarkable for the large number of white varieties it contained. (Silver-gilt Banksian Medal.)

Messrs. BARR AND SONS, King Street, Covent Garden, were again large exhibitors of *Daffodils*, and presented a wide selection of varieties, although poetics and *Loddii* forms appeared to predominate. (Silver-gilt Banksian Medal.)

Messrs. H. CHAPMAN, LTD., Rye, had a small but very select group of dainty *Daffodils*. The outstanding flower was *Vintage*, which received an Award of Merit. (Silver Flora Medal.)

Mr. GEORGE CREBER, Woodcote, Alver-stoke, contributed a selection of modern varieties and seedlings. (Silver Banksian Medal.)

A few beautiful flowers were sent by MARTIN H. F. SUTTON, Esq., Earfield Park, Reading, and Mont d'Or, a golden Trumpet, was the outstanding variety. Mr. C. A. JARDIN, Richmond Road, Balham, showed his method of raising seedling *Daffodils* in boxes.

Fruit and Vegetable Committee

Present, Messrs. J. Cheal, vice chairman, W. Wilks, E. A. Binyard, P. D. Tuckett, J. C. Allgrove, E. Harriss, G. P. Berry, A. Bullock, P. C. M. Vetch, J. Harrison, W. H. DIVERS and W. Bates.

Groups.

Silver-gilt Knighthood Medal to Messrs. SUTTON AND SONS, Reading, for vegetables; *Silver Bank medal* to Messrs. DORRIS AND CO., Edinburgh, for Potatoes.

Obituary.

CAPTAIN HARRY SANDERSON. News of the death of this well-known lover of Alpine plants, and very gallant soldier, has just been received with the deepest regret by all who knew him. He was before the war a partner in the firm of P. and B. SANDERSON, two old manufacturers of Galahels, and, though over military age and married, enlisted as a private in the Horse Artillery attached to Lord Lovat's Brigade. Owing to his ability, character, and devotion to duty, he rapidly rose to the position of captain in the Royal Field Artillery. He commanded his battery in the battle of the Somme, where he was wounded, and returned to the Front some months ago, where he was killed recently in action. His garden at Galahels was full of rare Alpine plants, many of which he had collected himself in the Italian Alps, Benia, and Montenegro, and I am personally indebted to him for many gifts of rare and interesting plants, of which he was a most successful cultivator. He was a member of the Edinburgh Botanical Society, and took an active part in the public life of his native town and in all matters connected with the tweed trade, of which Galahels is the centre. When Professor Ewart, of the Edinburgh University, first introduced him to me as a man whose technical knowledge of Scotch wood might be most helpful to us in breeding Shetland sheep, I found him ready and willing to do for us what very few manufacturers would have taken so much trouble to do; and the very beautifully woven fine wools, which he has now derived from the wool we sent him were considered by the many ladies who have worn them as unrivalled for their lightness, texture, and beauty. *H. J. Elwes, Colchester.*

CROPS AND STOCK ON THE HOME FARM.

WHEAT FOR 1918.

FARMERS, large and small, have to look ahead, sometimes for two years, in regulating and arranging their crops. On some farms producing mainly corn, hay and cattle, but with no regular sheep flock, a system of strict course cropping leaves but little alternative as to the choice of crops. If sheep are a main object on farms where the soil is of a light character, a four or other course method is not always practicable; it is mainly a question of circumstances as they affect the regulation of the food supply.

It behoves all farmers to make arrangements for a full supply of Wheat for next year, and now is the time to make plans. There are four main, or regular, preparations for the Wheat crop: 1st, following second crop Clover, either sheep fed or manured, at the rate of fifteen to twenty tons of manure per acre; 2nd, after Rape and Turnips, sheep fed; 3rd, summer fallow and manured; 4th, winter Vetches, sheep fed in July, and sown after with Mustard ploughed in, or sheep again fed.

All these methods will give good results with proper cultural conditions. No. 1 will follow in the normal way as to clearance of crop and ploughing preparation in September or October, as the case may be. For No. 2 no time should be lost in drilling a mixture of Pomeranian or Early Globe Turnips, 1 lb. of the former to 3 lb. of the latter per acre. Some persons sow the seed broadcast; this I do not approve, as no opportunity is thus given to remove Charlock or other weeds, which, if allowed to grow unchecked, may ruin the crop.

No. 3 The land should be continuously ploughed when the weather is favourable—that is, dry. No implement on the farm is equal to the plough in manipulating the soil. Cultivators, scarifiers, drags and harrows are useful in stirring the surface quickly for the removal of Couch, but the plough more effectively turns over and disintegrates the soil. Couch should be destroyed during the summer preparation, and no method answers better than burning it on the land in small heaps, which not only results in a saving of labour, but the ash returned evenly over the land gives a dressing of potash. The manure is put on the last time before finally ploughing in September or October if very early sowing is anticipated.

No. 4 preparation does not take effect until the Vetches are cleared at the end of July, in time to plough and sow Mustard by the middle of August.

These are what I term the main Wheat preparations. Of course there are other preceding crops that of necessity have to be utilised at times, such as Mangold and Potatoes, neither of which is ideal for Wheat, as both draw freely on the manure in the land. This, however, can be rectified by applying more manure, or by ploughing in a top-dressing of superphosphate at sowing time or sulphate of ammonia in February.

When a good preparation for Wheat can be made as fallow well manured, it has the advantage that a good crop of Oats is assured after the Wheat, and with but little preparation, as the land being fallow there should not be any Couch or other weeds. All that is needed then is to plough up the stubble in good time in the autumn and sow the Oats early—February or March, as the case may be, according to weather conditions.

WHEAT IS CORN. No time should be lost in removing Docks and Thistles from all Corn crops. If the farmer are allowed to seed the land quickly becomes foul. Carefully digging them up without disturbing the Corn is a safe way of dealing with Docks, whilst cutting the Thistles with a weed hook will prevent seeding. Straw is spoilt by the presence of either of these weeds at harvest time. This is work well suited to women. Payment for the Dock roots by the hundred or thousand is a good method. The common Chamomile, known locally as "Morzan," is a most noxious weed among Clover or Trifolium. The plant grows vigorously; if allowed to seed it spoils the flavour of the Hay, and smothering much of the Clover and grass. *E. Molyneux.*

MARKETS.

COVENT GARDEN, May 9.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Aralia Sieboldii, Asparagus plumosus, Aspidistra, and others.

Remarks: Business is more brisk in this department just now and there is a good demand.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Anemone fulgens, Arums, Azalea, and others.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Cycas leaves, Fern, and others.

Last week, Spanish Iris is now arriving in larger quantities, and white and yellow varieties are on sale.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, and others.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Almonds, Apples, Apricots, and others.

GARDENING APPOINTMENTS

- List of gardening appointments including Mr Charles William Fowell, Mr H Ford, and Mr A W Perkins.

CATALOGUES RECEIVED.

Stuart Low and Co., Bush Hill Park, Enfield; Carringtons; C. J. Lambros, Glenbrook Nurseries, Emerald, Victoria.

Corrections: In the note on Chionodoxa (see p. 186) C. Tiniosi should read C. Tiniosi, and C. Tinoli, C. Tinoli.

Dutch Bees: B. T. We advise you to obtain a swarm of Italian bees in preference to Dutch. The latter are given to excessive swarming.

Gardeners' Holidays: D. B. S. Your employer is under no obligation to grant you a holiday unless an arrangement to that effect was made in writing at the time of your appointment.

Names of Plants: M. F. The blue flower is a form of Xiphidium montanum, the reddish spike Aloe succodrina.

Spraying Potatoes: Question—Your correspondent H. makes some excellent remarks on p. 186 on the spraying of Potatoes. Since receiving the circular issued from the Food Production Department of the Board of Agriculture and Fisheries, I have spoken to several allotment holders about the spraying of their Potato crops, and all, so far, are ready to do what they can.

Answer—Your best plan would be to find out how many allotment holders in your immediate neighbourhood wish to have their Potatoes sprayed. Measure up the area of their Potatoes (in rods). Allowing that, when separate plots have to be sprayed, a man can do from 1/2 to 3/4 acre in an 8-hour day, calculate the time required to spray your plots. Get the nurseryman to fix the price for the hire of the sprayer he is willing to lend. If you have among you a competent man accustomed to spraying, arrange with him to do all the spraying and also to prepare the wash. The price of the chemicals required to make 40 gallons of spraying mixture is 3s., and this quantity will spray about 50 rods once. You can then reckon the amount of the chemicals required to spray your area twice. Having done so, place your order for the chemicals with the Food Production Department. If you have no experienced sprayer in your neighbourhood, the above-mentioned Department will send an expert to show you or one of your friends willing to do the work how to set about it. You will, of course, require a barrel or cask for mixing the specific, and a supply of water.

JOTTINGS OF A GENTLEMAN GARDENER

A practical guide to Flower Gardening for Amateur Gardeners; to which is added some suggestions on growing food plants during the war. By E. T. ELLIS, F.R.H.S.

ABSTRACT OF CONTENTS:

Starting a Garden—Annuals, Biennials, and Perennials—Colour Borders—Rock Gardens—Paths, Weeds, Pests, and Diseases—Propagation of Plants—Soils and Manures and their Management—Experiment in Gardening—Picturesque Vegetable Gardening—Flower and Vegetable Calendars.

"His enthusiasm for the garden is as great as his knowledge of the subject, as many of the new allotment workers round about Evesham have reason to know. They will owe much of their success to the careful guidance they have received from Mr. Ellis. The same kind of care is shown in this book. . . His observations on gardens generally will be helpful to the allotment workers."

Sheffield Daily Telegraph.

CRUSOE'S ISLAND: JUAN FERNANDEZ.

"I am monarch of all I survey,
My right there is none to dispute,
From the centre all round to the sea,
I am lord of the fow, and the brute."
—Cooper.

AS long as life lasts the enchanted island of Robinson Crusoe will not cease to fill the fancy. In youth one dreams of that wonderful spot, with its tiny creek, its talking parrot, its goats, its solitary inhabitant, and, above all, its horrible savages. Not one of us but has dwelled there with Robinson, helped him provision his island from the wreck, loaded his guns, discovered those terrifying footprints in the sand, and started up to find oneself awake. Had the enemy his way to-day, we should all be Crusoes, sowing the last scrap of corn, and watching its germination with reverent eyes. While it is true that many of us now carry the spade as Crusoe carried it, and a great number have been glad of his goat skins, and particularly his old clothes, it seems unlikely that we shall ever be reduced to such straits as poor Robinson.

The story of the actual island upon which Alexander Selkirk, a humble sailor from Largo in Fife, and the supposed prototype of Crusoe, was marooned, is full of interest to the people of these islands. In regard to Selkirk one recalls the controversy regarding Defoe and his hero. Just as there are Baconites, so there are anti-Selkirkites, who contend that Defoe's masterly example of English narrative was not founded on Selkirk's experience; whilst others believe that the author of the book was not Defoe but Lord Oxford, a discussion which need not trouble us here. The bother is that Defoe placed his island off the mouth of the Orinoco, whilst Selkirk's, known to us as Juan Fernandez, is some 400 miles west of the Chilean coast on the other side of the South American Continent.

As Moseley, the naturalist on the voyage of H.M.S. "Challenger," remarks, Defoe was obliged to lay the scene of his story in the West Indies in order to bring in the Catharine on Friday. He thus gained the parrot, but he lost the sea elephants and fur seals of Juan Fernandez, one of the latter of which would have made a capital pet for Crusoe.

Defoe, describing his approach to the island, makes the following interesting remarks: "It was with the liveliest interest that we approached the scene of Alexander Selkirk's life of seclusion and hardship, and an island with the existence of which, in the case of most of us, the very fact that we were at sea on a long voyage was more or less distantly connected. The story

of Robinson Crusoe certainly first gave me a desire to go to sea, and Darwin's Journal 'settled the matter.' So it was with most of us in our youthful days."

"But thou, Defoe, over that lone isle hast thrown

A spell so potent, who hath felt it not?"

Unto my boyhood 'twas a fairy spot;

Yet to my fancy so familiar made,

I seem'd as well to know creek, cave, and grot,

Its open beach, its tangled greenwood shade,

As if I there had dwelt and Crusoe's part had play'd"—Barton.

Assuming that Alexander Selkirk, then, was the prototype of Robinson Crusoe, it will be of interest to trace the history of the island upon which he was marooned for about four and a half years, and to glance at its remarkable fauna and flora, both of which are in many ways of great interest. The natural history of these isolated spots of land in the South Pacific and Indian Oceans, the relics maybe of a one-time vast Antarctic continent, has a special fascination for the botanist, geologist, and zoologist, who can respectively, from a consideration of their flora, the record of the rocks and a study of the animal life,

pigs on the island. In 1624 the Nassau fleet, under Admiral Jacob l'Hermitte, anchored in Cumberland Bay. They observed a large number of fur seals and sea elephants, and many were killed. The goats were difficult to approach. It is recorded that sandal-wood was then present on the island in great quantity. Three soldiers and three gunners of the Vice-Admiral's ship remained, for what reason is not stated; but their fate is unknown, for from 1624 to 1680 little or nothing is known of the island.

On Christmas Day, 1680, the rover Sharp anchored off Juan Fernandez. The goats had then become so numerous that as many as 100 were salted down for further use. Whilst retreating his ship, Sharp was surprised by the sudden appearance of three Spanish war vessels. He hurriedly left the island, inadvertently leaving behind one of his crew, a Mosquito Indian named William, who had only the clothes on his back, a musket, a knife, a small horn of gunpowder, and a few shot. Dampier states that William at first could procure scarcely any food but seals, which he found very ordinary eating; some other food he obtained by means of his powder and shot, but these were soon expended. He contrived by notching his knife to saw the

speculate on the probable past history of this vanished area.

Juan Fernandez is the largest of a group of three islands in the South Pacific, between 30° and 51° S., and 80° W., that is, about as far to the south of the equator as Madeira is to the north. The group now belongs to Chile, and is included in the province of Valparaiso. That upon which Selkirk was marooned, and which we name Juan Fernandez, is called by the Spaniards, Mas a Tierra (more to land); the second, Mas a Fuera (more to sea), 100 miles further west. To the south-west of Mas a Tierra is the islet of Santa Clara. Juan Fernandez is named after a bold Spanish sailor of that name, who discovered it in 1605. He, like his celebrated successor, Selkirk, lived for some time as "monarch of all he surveyed," but he soon wearied of the "charms of solitude," leaving behind him a herd of goats and pigs which he had imported. Subsequently, the island was the haunt of Spanish rovers and fishermen from the coast of Peru, the surrounding seas being well stocked with fish of many kinds. In 1616 Le Maire and Schouten, on their voyage round the world, called at the island, watered their ships, and obtained a supply of fish. They found numerous goats and

barrel of the gun into small pieces, no light task, which he made into harpoons, lances, hooks, and a long knife, by heating the iron and beating it out with stones. With these he obtained a plentiful supply of goats, birds, and fish. When his clothes had worn out he clad himself with a skin around the waist, and from the skins of seals he made fishing lines. Half a mile from the shore he built a hut lined with goat skins. When Spanish vessels visited the island he always contrived to hide himself and escape their notice. He was rescued in March, 1684, by Dampier and Cook, who called for supplies. In the vessels were several men who had formerly served with Sharp, one of whom was a country man of William, named Robin. In order to give his rescuers a hearty welcome, he caught and killed three goats, and dressed them with the Cabbage Palm (*Juana australis*). The meeting of the two Indians is thus described by Dampier: "Robin, who was the first that leaped on shore, ran to his brother Mosquito man, threw himself at on his face at his feet, who, helping him up and embracing him, fell in turn on his face at Robin's feet, and was by him taken up also. We stood with pleasure beholding this meeting, which was exceedingly affect-

trionate on both sides, and when their ceremonies of civility were over, we also, that stood gazing at them, drew near. Each of us embraced him we had found there, who was overjoyed to see so many of his friends come hither, as he thought, purposely to fetch him." Probably this incident was in Defoe's mind when describing the touching meeting of Friday and his aged father.

we called lion baiting, usually seven or eight or more of us would go, each with a handspike in his hand, and so prick him to death, which commonly would be a sport for two or three hours before we could conquer him, and oftentimes he would find us weak enough, but he being an unweildy creature, and we assaulting him both behind, before, and all round, we must needs

Thomson aptly describes his plight in the following lines:

"These ruffians left me—yet believe me, Arcas,
Such is the rooted love we bear mankind,
All ruffians as they were, I never heard
A sound so dismal as their parting oars."
J. Hutchinson, Kew.

(To be continued.)

FIG. 75. COAST OF JUAN FERNANDEZ, SHOWING THE RAGGED CHARACTER OF THE ISLAND.

The "Bachelor's Delight," Captain Davies, was the next vessel on record to visit the island in 1636 and 1657. Towards the end of the latter year nine of the crew, five seamen and four negro boys, through poverty caused by gambling, chose to stay on the island. They planted Indian Corn, and tamed a number of goats, which supplied them with milk and meat. There were plenty of Turnips and other wild vegetables, great numbers of sea fowl (Partridges), producing palatable eggs, and abundance of fish. They remained on the island until taken off by Captain Strong in 1690.

Then came the celebrated Alexander Selkirk, in February, 1704. His story may not be familiar to many readers, so his principal experiences may be recalled. He left England on September 11, 1703, with Captain Dampier's expedition to the South Seas, as sailing master of the "Cinque Ports" galley, with Charles Pickering, captain, and Thomas Stradling, lieutenant. Captain Pickering died off the Brazilian coast, and Stradling took command of the vessel. He anchored in Cumberland Bay, Juan Fernandez, on February 10, 1704, where the "St. George" (Captain Dampier) joined him the next day. Whilst engaged in watering and refitting their vessels, a mutiny of the crew of the "Cinque Ports" galley broke out, and forty-two men went on shore, where they remained two days, after which they were persuaded by Dampier to return to their duty. It is recorded that they caught goats, and considered a joint of one roasted with about half a foot of boiled Cabbage a very good meal. They killed several sea elephants, and from their fat made a ton of oil for their lamps. But they seem to have had rather cruel sport with these poor creatures. According to Funnell, a member of the party, "one which they killed was 23 feet long and 14½ round, and cut 17 inches deep in fat. When they were hard pressed they would turn about, raise their bodies up, and face their pursuers, standing with their mouths wide open, upon their guard, on which occasion if they wished to kill one, they would clap a pistol to its mouth and fire down its throat; but if we had a mind to have some sport with him, which

conquer yet often he put us to the run, and sometimes he would run himself, but knew not which way, for we commonly got between the water and him." Afterwards Stradling and "honour" Alexander Selkirk quarrelled irreconcilably, and Selkirk determined to part company at the first opportunity. Towards the end of August Stradling again anchored at

FIG. 76. INTERIOR OF THE ISLAND OF JUAN FERNANDEZ, SHOWING THE WELL-WOODED VALLEYS.

Juan Fernandez, and took off two men who had been left behind on the previous visit. Selkirk there and then decided to carry out his project, and obtained leave to land with his effects, but as soon as the vessel was under weigh he regretted his action, and asked in vain to be taken on board again; but Stradling was obstinate, and chose to construe his behaviour into mutiny.

and growth of Orchid seedlings is known to be present in different plants in varying degree, and it may be that *Odontoglossum Edwardii*, being a well-marked species, furnishes the best medium, and whether preference and useful to know whether other raisers have noted similar results, and whether preference for any special plants in this direction has been observed.

ORCHID NOTES AND CLEANINGS.

MASDEVALLIA O'BRIENIANA.

A FINE tuft of this remarkable little species is in flower, with other *Masdevallias*, in the gardens of Mrs. Berghem, Belsize Court, Hampstead. Mr. Page, the gardener, states that the plant is almost perpetual flowering, the pretty yellow flowers spotted with maroon lasting a long time individually and following each other in regular succession. This very interesting species originated with the late R. L. Measures, of Cumberland, from South America. Its habitat, however, has always been doubtful, and as no other specimen seems to have been imported, it could never be verified. The species, which is only 2 or 3 inches in height, was described in *Gard. Chron.*, November 3, 1890, and is worthy of note in support of the argument that even frail Orchids do not decline and pass away if carefully tended.

ODONTOGLOSSUM SEEDLINGS.

SEEDS of *Odontoglossum* sown in the pots of other *Odontoglossum* in the cool Orchid house at The Warren House, Stanmore, are germinating freely. Mr. Haddon, the Orchid grower, states that his experience, extending over some years, points to the fact that the best results are obtained, both in the germination of the seed and the development of the seedlings, by sowing on the surface of the material in which an *Odontoglossum Edwardii* hybrid is growing. The micro-fungus necessary for the successful germination

ON INCREASED FOOD PRODUCTION.

BUTTER BEANS.

SURELY it is a slip of the pen that is responsible for Mr. Beckett's statement on page 191 that "almost any variety of Dwarf Bean may be utilised for the purpose"—*i.e.*, producing Butter Beans. The Butter Bean of commerce and the restaurants is totally different from the seeds of most varieties of French Bean, and much more nearly resembles the seeds of the Broad Bean in size and shape, while, except for colouring, almost all the French Beans are practically identical with the Haricots of commerce. Such varieties of French or Dwarf Bean as Canadian Wonder, Early Favourite, Reliance, and Negro Largo could not, by any stretch of imagination, be considered as substitutes for the Butter Bean, which seems to be a climbing variety attaining an average height of 6 feet; the European variety nearest it appears to be Mont d'Or Waxy pod.

Except for our fastidiousness, there is no reason why the seeds of all or any Beans—French, Runner or Broad—should not be eaten, but most people ban the coloured varieties, though some epicures declare them to be of superior flavour. Those who are now using Haricots and Butter Beans for the first time will find that they cook better and are more tender if boiling water is poured over them overnight.

Now that Beans are so largely used as substitutes for animal food it may be interesting to mention that in the West of England Broad Beans have long been known to the cottager as "Meat Beans" in fact, in some parts of North Cornwall they are known by no other name.

The best way to grow Haricots and Butter Beans is to treat them purely as seed crops, and not to gather any in a green state. A light and relatively poor soil will give better results than a rich staple, and a sunny, sheltered position is best. The white-seeded Dwarf Beans should be sown 4 to 5 inches apart in 2 inch drills drawn 25 inches asunder, while 2 inches or 3 inches more in the rows should be allowed for the Butter Beans and correspondingly increased distances from row to row. *J. C. Burdett*

There is some confusion about the name Butter Bean. Those who are not gardeners think of the white seeds sold by grocers. The large-seeded kind is most often named Butter Bean; the small, white-seeded one is the Haricot, or Haricot Bean. I understand that these are sometimes, if not always, kiln-dried, and in that case would not be reliable for sowing. The Butter Beans of the seedmen are the dwarf and runner Golden Wax Pods. This is the race, I presume, to which Mr. Beckett (p. 191) alludes. The seeds of the runner form, or Mont d'Or, of this are very dark purple, almost black, and many who would be most benefited by drying Dwarf Beans or Scarlet Runners for winter use are prejudiced against any colour except white. This idea, of course, has been fostered by the white-seeded varieties supplied by the grocer. I have had many inquiries whether Scarlet Runners were eatable in the dried state, or, indeed, any other than the White Haricot. The White Haricot is listed by some of our seedsmen; and the White Dutch, rarely listed by them, has white seeds. This is a climbing variety or Runner Bean. Those who object to colour would find Green Gem and Green Haricot very useful in the dried state. The last-named can be boiled quite tender in one hour, and makes very delicate eating. Other Dwarf Beans worth drying are Excelsior (pale to deep yellow, often tinted pale fawn) and Fillbasket (more decidedly fawn). In any case, they are paler in colour than the brown Beans of the grocer's shop. If the prejudice of colour were laid aside, any Dwarf Bean or Scarlet Runner might be dried for winter use. Magnum Bonum, as stated, is

a good one, because productive. Canadian Wonder is another. *J. F.*

CROPS FOR GARDEN REFUSE HEAPS.

GARDEN refuse heaps may be planted with Vegetable Marrows, New Zealand Spinach, and similar crops, as has been regularly done here. Tomatos also may be planted on the heaps, their fruit being kept clean by old Pea sticks, or something of the kind, laid on the heap, upon which to train the plants. Soil fit for the requirements of these plants is usually to be found amongst the heap, and if not, it is an easy matter to make suitable strata for them.

SNAP CROPS OF POTATOS

THE remarks recently made with reference to the spaces apart that Potatos should be planted reminds me of the exceptionally good crops that were grown at Crimmoesgate, Aberdeenshire, by the late Mr. James Esson, who was gardener and forester for many years on that estate, and from whom I gained my earliest experience in gardening. When making preparations for the planting of forest trees, the land was trenched sufficiently deep to break a "pan," which was invariably found underlying the surface. Small trees were used for planting, those intended to form the permanent plantations being placed at distances from each other, that were considered essential to their ultimate requirements, while the spaces between them were filled by "nurses"—usually Larch Potatos were subsequently planted in places where there was sufficient room for the plants to develop. The plantations, at least, for the first year, were kept free of weeds by hoeing, and in due time, as this work proceeded, the Potatos were entiled up. That the land was suitable for the growth of the Potato, and the plants fully exposed to the sun, and not robbed by neighbouring plants, favoured the crop. *Thos. Chamber, The Healds, Monmouth.*

BEANS AND PEAS FOR DRYING

ALL the white-seeded varieties of both Dwarf and Runner Beans are suitable for winter use as Haricots, as also are Excelsior (a golden brown-seeded Dwarf Bean) and the Dwarf Green Horn cut. In the case of the Dwarf varieties all the pods should be allowed to remain on the plants and ripen naturally in the sun. About the end of September the whole plant should be pulled up and the haulms hung in a dry, airy shed or spare room. In the case of Runner Beans a first picking green is sometimes taken off by growers, but it is perhaps safer to let the whole crop ripen; the plants may be punched back after a good crop has set. As the haulms of Runner Beans are large for hanging up, the individual pods may be gathered in autumn and placed in an airy place to complete their drying.

The best variety of Pea to sow now is Little Marvel; it not only cooks well during the winter, but has the further advantage of maturing early, and being a dwarf growing variety it does not need staking and is easily handled. The treatment in harvesting is the same as for Haricot Beans, a full crop being allowed to develop on the plants and ripen entirely out of doors if the weather is favourable, or the whole plant may be pulled up in autumn and suspended in a dry, airy shed or spare room. A most important point for amateurs to bear in mind is that the Beans or Peas must be thoroughly dry and the seeds quite hard before they are stored for the winter. Last autumn, owing to the continued wet weather, it was necessary for many seed growers to finish the drying of both Beans and Peas in trays before they could be safely bagged. Like most other things, however, it is only ordinary care that is required to ensure success, and in view of the prospective shortage of food for next year it is "up to all" to do what is possible to produce a reserve of food by their own endeavours. *Barr and Sons.*

ALLOTMENTS.

THOSE of us who have been in direct contact with allotment holders in different parts of the country must agree that there is a distinct and insistent demand that the allotments shall, in the great majority of cases, continue in perpetuity. The individual advantages—productive, physical, and social—are so apparent as to need no reference, and these will increase. The great stumbling block in the way of the realisation of the allotment holders' wishes is naturally the landowner, and too often his agent. Most allotment holders are ready and willing to pay a reasonable annual rent for their plots, and at first sight it would seem that this would satisfy the owner of the land. But it must be remembered that most of the recent allotments are parcelled out on land which, in auctioneer's parlance, is "ripe for building," and which, soon after the war is over, the owner hopes will be used for that purpose. In this case the ground rents would produce a greater income, with less attendant expense, than the 6d. or 1s. per rod which is the customary allotment rental, and is as much as most holders can afford to pay. The ideal remedy is not clear. It has been contended that in a matter of such national importance the Government should either assist the holders by paying part rent, or should exercise powers to ensure the retention of the allotments at customary rents. While the latter would be manifestly unjust to the landowner, the former would be unfair to taxpayers generally, and would tend to pauperise the individual workers. In a few instances no doubt the landowner would, out of public spirit, meet the workers, and allow the land to remain as allotments at a low rental, but this would not be possible in all cases. *A. C. Bartlett.*

POTATO SPRAYING

I WAS much interested in your reply to a correspondent on p. 193. Having in view the fact that the inquirer appears to be a novice in the preparation of washes, I should advise him to use Bordeaux in preference to an ordinary, home-prepared Bordeaux mixture. The paste recommended is made from the Woburn formula, and is exceedingly easy to handle and absolutely reliable, provided, of course, that it is correctly applied through a suitable apparatus. In very small quantities it comes out rather more expensive than Bordeaux mixture, but if a bulk purchase can be arranged by co-operation the costs are almost exactly equal, and one is saved the not inconsiderable labour attached to the mixing of the raw materials. My committee is endeavouring to persuade all cottagers, allotment holders, small holders and farmers to spray this season, and the response to date is excellent, although no spraying has been done here in the past. *Horace J. Wright, Ludington, Amptill.*

PLANTING POTATOS.

I AM surprised to read on p. 181 Mr. W. H. Dyers' statement that he has always planted all varieties of Potatos at the same distance apart, both in the rows and between the sets, *viz.*, 2 feet from row to row and 1 foot from plant to plant. If strong-growing varieties require only that distance, surely such varieties as May Queen and Sharpe's Victor should be planted closer, as all early varieties, many of which produce much less haulm than later ones, have the benefit of maturing earlier in the summer, which, anyhow during my experience, is a great factor in escaping disease.

I notice also on p. 182 the writer of your calendar on the "Kitchen Garden," Mr. J. Dunn, who is certainly one of our most skilful and experienced vegetable growers, states that maincrop and late varieties should be allowed plenty of room for the plants to develop. "Strong-growing varieties require a space of 3 feet between the rows, and at least 15 inches between the sets in the row." With these remarks I am entirely in agreement. I also

agree with many of the remarks made by J. F. in the same issue, that one should be guided to a great extent "by the nature of the soil and surroundings, as to the distance between the rows and sets." If he will carefully read my notes on the question he will observe that I stated that if "the soil is very high, light and poor in quality, then "the distance may be slightly decreased" E. Beckett.

DUTCH HARIOT BEANS.

The consignment of brown Haricot Beans ordered by the Royal Horticultural Society from Holland for distribution among the Fellows of the Society has now arrived, and is being distributed. Those who desire to grow a small breadth of this Bean, the flavour of which is excellent, should apply to the Secretary, Royal Horticultural Society, Vincent Square, Westminster. The price at which the Beans may be obtained is 1s. per pint, plus postage, 7d.

SPRAYING DEMONSTRATION AT WISLEY.

We learn that through the courtesy of the Council of the R.H.S. a spraying demonstration for officers of the Army Canteens Committee was held by the Horticultural Section of the Food Production Department at Wisley on Monday, the 14th inst. The demonstration was attended by 50 officers, who displayed the greatest interest in the work of spraying, the construction of the different types of Knapsack sprayers, and the mixing of Burgundy mixture. Inasmuch as the Army Canteens Committee is Potato farming to the extent of several thousands of acres, the whole of which area is to be sprayed, the demonstration had a severely practical character. Among others who shouldered the Knapsack sprayer was a Brigadier-General. The Army is vying with the Western Counties of England in the organisation of Potato spraying.

FOOD CONSERVATION.

In association with the Horticultural Section (Food Production Department), the Agricultural Organisation Society (chairman, Mr. Leslie Scott, K.C., M.P.) is giving attention to the question of fruit and vegetable conservation. A permit has been obtained for the manufacture in England of a modified form of the American Home Canner, an apparatus which is extremely popular in the United States and in Canada. Mr. R. A. Yerburch, the late president of the society, presented several canners to Englishwomen's institutes, and there is a consensus of opinion that these machines can be made of great service for preserving surplus fruit and vegetables. However, a difficulty has arisen in connection with the supply of tin for cans. In the course of an interview this week the member for the Exchange Division of Liverpool explained the situation.

"Judging by the reports from all parts of the country," said Mr. Scott, "there is a strong probability of especially large crops of fruit this season, and it is desirable that better use should be made of the surplus than in past years. In every district there should be facilities for the conservation in particular of fruit that otherwise would be allowed to rot. I know the difficulties of the Ministry of Munitions; that the demands of our own Army and the allied Armies in the matter of tin must have a prior claim, but I submit to the Government that if they insist that tin must be found for fruit preservation purposes, it can and will be found.

"Another matter hardly less important," went on Mr. Scott, "is the necessity for some method by which the produce of the thousands of new allotments and small holdings can be stored for the autumn or winter use of their growers. Probably the majority of these men and women who have taken land and are endeavouring to assist in food production have no storage space to speak of. I suggest that the Board of Agriculture, the Food Controller, and others who may be held responsible in this con-

nection should approach the local authorities throughout the country and try to arrange for the provision of suitable centres where roots and other storable produce of the little man could be deposited. The details must be worked out, but it seems to me quite practicable that a warrant should be given to each depositor for the quantity and quality of goods handed in, and that on the production of this warrant at a later date the goods deposited or their equivalent should be delivered to the depositor."

A HYBRID MINT.

From the time of Linnaeus to the present day a spicate form of Mint has been making its appearance on the Continent and in this country. Dr. afterwards Sir, James Edward Smith, in 1799, described three varieties besides the typical *Mentha* hybrids. One of the varieties is still grown in Surrey gardens and used for making Mint cake. I have no doubt all three were hybrids—namely, *M. rotundifolia* × *viridis*, and that the hybrids continue to be made in the wild state, for I have seen several of them collected by botanists. Dr. Smith described a fourth, of which he had dried specimens, quoting LINNÆUS, *Horius cliffortianus* 306, No. 5, with the description, "*Mentha floribus spicatis, foliis cordatis dentatis undulatis sessilibus*." It had not then been observed in Britain. Since then it has been gathered on the banks of the Tay, and this was identified by Mr. J. G. Baker as *Mentha hibernica*, Koch. I have also seen specimens from Switzerland. A few years ago I had it sent me from waste ground at Swanage. Last year it grew 3 feet high in pots plunged in soil, and this spring the rhizomes had almost filled the pots to the exclusion of most of the soil. One stem bore leaves in whorls of three, indicating the vigour of the hybrid. For Mint sauce it is strong in flavour, but not more so than the hybrid in Surrey gardens. It is nearest to *M. rotundifolia* of any of the hybrids I have seen, but is nearly glabrous. The best known of these hybrids, recognised as such, is *M. crispa*, Linn., but that is merely a monstrous form with the venation of the leaves arising from the base and spreading like a fan. There is a similar form attached to *M. sylvestris*, with very large leaves. J. F.

PRICES OF VEGETABLES NEARLY EIGHTY YEARS AGO.

Is looking over a volume of *The Gardener's Magazine* for 1839, I was much interested in the prices of vegetable compared with those of to-day. Here is a report from Covent Garden Market, dated March 22, on the same lines as that given weekly in *The Gardener's Chronicle*. The price of Potatoes per ton was £5 10s. to £5, or 1s. 6d. to 3s. per bushel, while Jerusalem Artichokes were 1s. per half-sieve, Carrots 6s. to 6d. per bunch, and Parsnips, then split Parsnips, 9d. to 1s. 7d. per dozen, and Turnips 2d. to 5d. a bunch. Of green vegetables, Cabbage at 4s. to 5s. per dozen cannot be regarded as cheap, but the price of a dozen Savoys was only 1s. to 1s. 6d., with Brussels Sprouts 1s. 6d. to 2s. 6d. per half-sieve, Spinach at 1s. 6d. to 2s. per sieve would have been appreciated this year of abnormal prices, and so would old Onions at 5s. 6d. per bushel. Green or Spring Onions, referred to by their French name of *Oignons verts* 5d. to 6d. a bunch. Seakale at 1s. to 2s. a punnet was certainly not expensive, while Cose Lettuce at 1s. 6d. a score and Cabbage Lettuce at 6d. for the same number could not be looked upon as dear. A bundle of Celery consisting of 12 to 15 heads was quoted at from 1s. to 2s. Mushrooms realised 2s. to 4s. per pottle, while Brocks were quoted at 14s. a lb., and Truffles at about the same. These last two items are now but rarely priced in market lists. Of fruits, forced Strawberries were 7s. per ounce, Pineapples 8s. to 12s. per pound, Hothouse Grapes £1 10s. to £2 per pound, and Cucumbers 6s. to 10s. per brace if 7

THE KITCHEN GARDEN.

By J. DUNN, Foreman Royal Gardens, Windsor.

EARLY CARROTS.—The first-sown Carrots will soon be ready for thinning, and this work should be taken in hand at the earliest opportunity, as numerous small weeds make their appearance now which, if not destroyed, will soon render the thinning of the crop a tedious operation. In the case of stump-rooted varieties intended for early supplies no severe thinning will be necessary; a space of 3 or 4 inches between the plants will be sufficient. Hoe the ground frequently and dust the plants freely with soot during moist weather. A sowing of intermediate, or some other freely growing variety, should be made at once, the ground being first thoroughly pulverised and the surface sowed with fine and level as possible. Sow the seeds thinly and cover them lightly. If damp weather sets in slugs may prove troublesome, and should be destroyed by frequent applications of soot and lime.

BEET.—The present is a good time to sow a good breadth of Beet. This crop also requires fine, rich soil to induce quick growth. Leave a space of 18 inches between the rows, and when the plants are about 2 inches high thin them to 9 inches apart in the rows. Keep the hoe freely at work amongst the plants during fine weather, so that the bed may be kept free from weeds. Turnip-rooted Beet may be sown until July 1 with a view to producing tender young specimens throughout the autumn. Young Beet in frames must be allowed plenty of ventilation; remove the lights during warm days, and replace them again at night if the weather is cold. Beetroot in store should be frequently examined, and all young growth carefully removed. The roots may be kept in good condition for some time by placing them behind a north wall and covering them with material that will protect them from drying winds.

VEGETABLE MARROWS.—These plants should not be allowed to remain in the pots too long, or they may become stunted and fail to start freely into growth. Where large supplies are desired they may be planted on a plot of good soil into which a quantity of decayed manure has been dug. Allow plenty of space between the plants and keep the growths regulated and thinned. When the plants are put out some protection from cold winds should be provided; a large pot placed over each plant at night will answer the purpose, but all pots must be removed early in the morning; they can then be protected from the wind by placing evergreen branches around them. If dry weather continues the plants will require careful attention with regard to water.

CHICORY.—The principal sowing of Chicory should be made with as little delay as possible. A space of 16 inches should be allowed between the rows, and the plants thinned to 9 inches apart as soon as they are of sufficient size. Slugs are sometimes troublesome, and must be destroyed by dusting the plants with lime in the early morning. Chicory roots may still be placed in a dark chamber with a view to producing black-headed for salad or for cooking purposes. Perfect darkness is necessary, and a fairly dry atmosphere.

CELERY.—Continue to prick out young plants in nursery beds, and allow a space of 9 inches between the plants, so that they may be lifted with good balls of soil when removed for planting in the trenches. Give plenty of water at the roots, and syringe overhead during dry weather in order to keep them from becoming hard and stunted. The trenches should be prepared and a good quantity of decayed manure applied with as little delay as possible.

MINT.—The present is the best time to make new plantations of mint. Light, rich soil should be selected and a sufficient number of sturdy

young shoots planted 1 foot apart with an ordinary dibber. Allow 1 foot each way between the plants; these should be about 4 inches high at the time of planting. Water them well, and keep the ground free from weeds during the summer.

SAGE should also be planted now. The cuttings may be taken with a heel, planted 2 feet apart each way, and the soil made firm. Water well while the weather is dry, and keep the ground lightly stirred with a hoe.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR DAVEN, Abbots Wood, Godalming, Surrey.

PEACHES AND NECTARINES.—Examine Peach and Nectarine trees closely to see that they are free from aphid and mildew. If necessary continue to spray the foliage with Quassia Extract, or weak paraffin emulsion may be used instead. I have found the latter specific most reliable provided it is not used too strong. For tender foliage it is wise to apply it at a slightly less strength than recommended in the directions supplied by the makers. For mildew apply flowers of sulphur or spray with sulphide of potassium. Continue to disbud the trees, removing all irregular growths, and severely thinning the remainder as advised in former calendars.

APRICOTS.—Apricot trees should be carefully watched for the maggot, which attacks the young growths. The trees may be sprayed as in the case of the Peach, but they are not so liable to attacks of aphid as Peaches and Nectarines. The roots must be watered if the soil is dry; there is a great danger from drought in light, freely drained soils seeing that no rain has fallen for 22 days.

CHERRY TREES.—Keep a sharp watch for black aphid on Cherry trees. The cold nights and warm days are all in favour of the pest, which, if not checked, will cause much trouble. The trees are full of flower, and immediately the fruit is set a good spraying, such as recommended for Peaches, should be given. The fruits on the earlier trees should be thinned as early as possible.

GOOSEBERRIES.—Gooseberry bushes are fruiting freely, and it is advisable to spray them with a strong solution of Quassia Extract to prevent attacks of the caterpillar, which strips the plants of their foliage. By the use of a garden engine and a good length of hose attached a large plantation may be sprayed in a little time. The thinning of the fruits may, with advantage be proceeded with as soon as possible, and the Gooseberries used both for bottling and the making of tart.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcott, Eastwell Park, Kent.

ASPARAGUS. Few foliage plants have a greater decorative value than the various species of Asparagus, which are grown in pots or baskets, and for use as cut foliage. A Sprengeri and A. decumbens are especially suitable as basket plants, and as such their grace and beauty are seen to the best advantage. Plants raised from seed sown early in the present year, and duly potted in 60-sized pots, are suitable for transferring to wire baskets. For large and conservatory baskets of the largest size should be used. Prepare a rich compost consisting of four parts good turfy loam, one part well-decayed manure, and one part leaf-mould, adding a 6-inch potful of bone-meal and seed to each bushful of the mixture. Line the baskets with moss, following this with a second lining of turfy loam, and the rougher parts of the compost. Plant five or six strong plants in the larger baskets, down to a single plant in a small basket. Individual plants in receptacles of moderate size are suitable for small conservatories or plant houses, where they give lightness and grace to their surroundings when suspended from the roof rafters. A decumbens is the better species for small houses; it does not

make such strong growth as A. Sprengeri, and is more graceful. A. Sprengeri is seen at its best in lofty houses, and when well cultivated adds greatly to the general decorative effect. Make the soil firm in the baskets and return them to a warm house till the plants become re-established in the soil. When growing freely the plants should be removed to their permanent positions in the conservatory or plant house. Well-established specimens need an abundance of water, and if given regular supplies of concentrated manure thrive in the same receptacle for several years. A. Sprengeri compacta is, as its name denotes, of dwarf and compact habit. The shoots of A. plumosus, and its dwarf variety minus are largely employed with cut blooms in vases, and the plants associated with flowering plants in pots. Of the other species A. tenuis minus is especially light and graceful. A. dolobrus is a lesser known species, but well worth including in a collection of plants. They all thrive in a warm greenhouse.

FRUITS UNDER GLASS.

By JAS. HINSON, Gardener to Mr. LEOPOLD DE ROTHSCHILD, C.V.O., Gunnersbury House, Acton, W.

STRAWBERRIES IN POTS.—The fruits on pot Strawberries will now develop rapidly, and fruit houses other than late or cold houses are unsuited for them at this season. Only plants with berries ripening should be left in the forcing houses. Attacks by red spider and even mildew must be guarded against. Full exposure to the sunlight is essential. The berries may not set so readily as hitherto, as sudden outbreaks of heat are not helpful in this respect.

VINE MILDEW. My experience is that mildew often attacks Vines during May, and more particularly when easterly winds prevail, causing a current of cold air in the house. On no account should the roof ventilators be opened in vinerys where the Grapes have recently been thinned or are approaching the stage when thinning is necessary. Sometimes for the purpose of retarding the Vines, the temperature is kept rather too low at night time. In such circumstances attacks of mildew may result and the disease spread rapidly. If the berries have reached the size of Peas there will be no danger of applying flowers of sulphur, provided the black land, as it is not so conspicuous as the yellow to the water pipes, mixing it with skim milk, so as to adhere. Then for one night immerse the vinery in the pipes and the mildew will be checked. In an earlier stage the better plan is to puff the sulphur on to the bunches that are attacked, as this is less liable to cause rust on the berries.

GRAPES ON THE POINT OF COLOURING. Vines with Grapes approaching ripening need extra careful management in ventilating. The temperature may be a little lower at night than hitherto. A period of five weeks is a suitable time to allow for berries on the point of colouring to perfect finish. When it is necessary to damp down it should be done when an is admitted in the morning. Never close the vinery at nightfall if it can possibly be avoided; rather leave both top and bottom ventilators open slightly.

THE ORCHID HOUSES.

By J. COLEBY, Gardener to Sir JEREMIAH COLEMAN, Bart., Garton Park, Reigate.

PHALAENOPSIS.—Plants of Phalaenopsis should be afforded fresh potting material each year, and P. amabilis, P. Stuartiana, P. Sandiana, and P. Schilleriana should be attended to at once. The plants are most frequently grown in teakwood cylinders or baskets, and when the receptacles show signs of decay new ones should be substituted. During the process of removing the plants take care not to injure the healthy roots. By immersing the basket for a short time in tepid water the roots will be more easily detached from the wood. The wires that hold the basket together should be cut and the bark removed singly. Detach

the roots carefully, using a thin knife-blade, wash all the old compost from them, and cut away all decayed portions. The new receptacle should be well drained, first placing a clean, flat crock over the bottom, and half-filling the basket with portions of Fern rhizomes. A suitable rooting medium consists of short portions of Osununda-fibre and Sphagnum-moss in equal proportions, mixed with finely-rubbed crocks. The roots should be woven between the bars of the basket, working the compost firmly between them until it is level with the top of the basket receptacle. Surface the basket with a layer of leaf heads of Sphagnum-moss. Plants that are growing in sound receptacles should have the old compost removed from between the roots by means of a pointed stick, and the dusty particles washed from between the drainage. Fill the receptacle with some of the fresh compost. These Orchids may also be grown successively in shallow pans, preferably those without side holes. Use clean crocks for drainage, and fill the pans with the compost a little above the rim. P. Emeraldia, P. violacea, and P. Lindemanniana are best grown in pans. Phalaenopsis should be grown in the warmest house, where there is a constant circulation of warm air, and shade is necessary from the sun's rays during spring and summer. They may be either suspended from the roof rafters or stood on the stage near the roof-glass on inverted pots in saucers of water. Keep the atmosphere moist during spring and summer by damping the walls and paths frequently during the day; in bright weather the plants are benefited by syringing between the pots and wetting the undersides of the leaves. Water the surface of the compost sparingly with a fine rose until the young roots have grown freely in the new soil, after which they may be afforded more liberal supplies of moisture. Plant of P. Rimstadiana are developing flowers, and should not be disturbed at the roots until after flowering is over. Phalaenopsis are large, strong, vigorous plants, producing large sprays of bloom, but the inflorescences should not be allowed to remain on the plants for too long a period; it is best to remove them as soon as the last bud has expanded. If flower spikes appear on weak plants, reduce the number of flower buds to two or three.

THE FLOWER GARDEN.

By W. J. GRISSE, Gardener to Mrs. DEMESTER, Keele Hall, Staffordshire.

SPRING FLOWERING PLANTS.—Certain spring flowering plants require to be propagated at this date. Arabis, may be pulled in pieces and the portions planted in rows on a partially-shaded border. Those of the choicer varieties should be inserted in boxes filled with a sandy compost and rooted in a clove frame. Clumps of Polyanthuses and Daisies should be divided and replanted in the reserve garden. As soon as single and double flowering Arabis have finished flowering they may be increased by division, retaining the roots when possible. This same method may be adopted to propagate Wiseman saxatile, although better plants are obtained from seed. Mosses, carefully lifted and replanted in the reserve garden, will give an abundance of young plants. Fancies should be sown in boxes or cold frames, and the seedlings transplanted at an early stage on a shady border, at a distance of 9 inches apart and 12 inches between the rows. Water young plants and seeds through a fine rose, and protect them from strong sunshine by light shadings. Bulls may be lifted directly the flowers are over and replanted in a reserve border. Water the root occasionally until the foliage turns yellow.

PLANTING BAMBOOS.—Where it is necessary to divide old plants of Bamboo, or to increase the stock, suitable pieces should be detached directly new growths appear. Dig the soil at least 2 feet deep, and enrich it with manure, leaf-mould, or decayed vegetable matter. Give copious watering to settle the soil about the roots. Topdress established plants with a compost consisting of loam and decayed manure and give occasional waterings with liquid manure.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary Department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under our notice of horticultural interest.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 54.5°.

ACTUAL TEMPERATURE.—Office, 41, Wellington Street, Covent Garden, London, Thursday, May 17, 10 a.m.: Bar, 29.3; temp, 49.5. Weather, Wet.

Narcissus Disease.

Disease in Narcissus has become so serious that a year or so ago the Narcissus Committee of the Royal Horticultural Society suggested that an investigation into the cause of disease and its remedy should be undertaken at the Wisley Research Station. The Council welcomed the suggestion, and appointed Mr. Ramsbottom an old student of Wisley—to carry out the investigation. After Mr. Ramsbottom's appointment it was found that disease of Narcissus was already being investigated by Miss Welsford at the Imperial College of Science, and it was known also that Mr. Barr was carrying out experiments with a view to discovering a remedy for the disease. It appeared desirable, therefore, that the several investigators should, so far as possible, join forces and work in co-operation with one another. It soon appeared, however, that the first thing for both Miss Welsford and Mr. Ramsbottom to do was to discover the real agent of the disease. This they set about doing, and it is interesting to record that both these investigators have arrived independently at a similar conclusion. Miss Welsford's results are in course of publication; but those obtained by Mr. Ramsbottom will not be published in full until certain further investigations now in progress have been completed.

The essential fact arrived at both by Miss Welsford and by Mr. Ramsbottom is that, as already suggested by Hewitt, the well-known disease of Narcissus is not, as

has been commonly supposed, due to a species of *Fusarium*, but is due to attack by a parasitic eelworm, *Tylenchus devastatrix*. Fusarium disease, as the malady of Narcissus has been commonly called, is, therefore, a misnomer, and the disease should in future be denoted as Eelworm Disease. An account of Mr. Ramsbottom's experiments was given by the author at a meeting of the Horticultural Club on the 8th inst.

In his opening remarks Mr. Ramsbottom acknowledged the generous assistance which he had received from Narcissus growers during the course of his investigations. Thanks to them he had had the opportunity of examining many hundreds of diseased Narcissus bulbs, and had also been able to visit numerous nurseries and bulb farms and make observations and conduct experiments in the field.

From these observations and experiments it was soon evident to Mr. Ramsbottom that the common view—that the disease is due to *Fusarium*—is erroneous. Examination of large numbers of diseased bulbs pointed conclusively to the culprit being a parasitic eelworm, which was identified with *Tylenchus devastatrix*, Kuhn. The disease may show itself in the bulbs or in the foliage, or in both bulbs and foliage. One or more of the fleshy scale leaves become of a distinct brownish or blackish colour, and when a diseased bulb is cut horizontally, the discoloured scale leaf or leaves appear as one or more dark rings—hence the name Ring disease, suggested by Mr. Ramsbottom. Microscopic examination of the tissue of a discoloured scale leaf reveals the presence of eelworm. In a diseased bulb the malady may appear not only in the scale leaves, but also in the embryo flower. When planted, such a bulb, if it grow at all throws up sickly yellow and twisted foliage. The individual leaves are silky and spongy, and are marked by elongated brownish areas which at times run along the whole edge of the leaf. Whitish, irregular irruptions of the leaf may also appear. Plants exhibiting these symptoms bear stunted flowers, and the flowers appear some time after those borne by healthy bulbs of the same species. Unfortunately, not every diseased bulb reveals its malady by such manifest symptoms. Bulbs which are lightly attacked may bear foliage which appears to be quite normal. Hence, although it is most desirable that bulbs bearing yellowish foliage should be dug up and destroyed, this procedure by no means guarantees that all diseased bulbs are removed.

Having obtained strong presumptive evidence that the disease is due to eelworm, Mr. Ramsbottom proceeded to seek for definite proof of this provisional conclusion. He succeeded in isolating eelworms, in growing them in pure culture, and in inoculating healthy Narcissus bulbs with them. This was done by taking some of the minute animals on the point of a sterilised needle and pricking them into the necks of healthy bulbs. The bulbs were planted in steam-sterilised soil in pots. The pots, together with others containing

uninoculated bulbs similarly planted, were placed in a cold frame on September 7. About five months afterwards (February 19th), when the inoculated bulbs were lifted they were found to be richly infested with eelworms, which had travelled down from the neck along the fleshy scales and had entered the basal plate, leaving in their track the brown stain characteristic of the diseased bulbs. All the twelve or more inoculated bulbs showed the presence of eelworm, and the symptoms of the disease, whereas none of the originally healthy uninoculated bulbs showed either eelworm or symptoms of disease.

In other experiments inoculation was effected in different ways, by introduction into the wound in the flower stalk made when the developed flowers are picked, by pricking the leaves four inches above the neck, and by placing eelworm on *uninjured leaves* at a few inches from the neck.

The results were remarkable. In less than a week inoculation by the first of these methods had led to rotting of the flower stalk, which assumed a wrinkled and distorted appearance. Inoculation of the pricked and of the intact leaf was also successful. In either case the leaves lost their natural rigidity, lay prone on the sides of the pot, and presented a wrinkled and deformed appearance.

It is evident, therefore, that not only is *Tylenchus devastatrix* the agent of the disease, but also that this eelworm behaves as a true—and not merely as a wound—parasite. It is an active and not only a passive agent of disease, and is able to gain access to the tissues of its victim both through wounds and by piercing the intact outer tissues of the leaf. Having regard to the importance of eelworm, we publish in full on page 207 Mr. Ramsbottom's summary of previous investigations into this pest, with other matter relative to the disease.

AN ALLOTMENT MANUAL.—This little brochure* on allotments is issued by the University of Leeds for growers in York shire. The cultural remarks are lucidly written, and most of them are orthodox. But when the cropping tables and the table of quantities are compared with each other, and these with the preceding remarks, there appears a want of co-ordination. How large some of these quantities are may be illustrated by mentioning the 1 oz. of seed of Brussels Sprouts marked as required to produce plants to furnish a run of rows extending to about 37 yards! Then, while such a valuable summer and winter food as the Broad Bean might have been given a larger extent of ground, the Celery, Spinach, Cauliflower, and Salsafy recommended are vegetables of such slight food value that they might well be excluded altogether. It would have been useful in a work of this kind had the expedients all experienced small cultivators use been described—*e.g.*, Broad Beans sown with Early Peas or singly alongside the alley between rows of other vegetables, or securing a full crop of Lettuces from one piece of ground by setting a young plant in the place of every one that is taken for use.

SPARROWS AND RATS.—The Board of Agriculture has lately recommended the destruction

* *The Making and Management of an Allotment.* By A. S. Galt. Price 3d.

of the house sparrow as being a large consumer of grain. Farmers, however, should be careful not to conduct a campaign against the lodge sparrow, which, in common with many other small birds, is valuable for keeping down insect pests. In countries where small birds have been destroyed indiscriminately disastrous results have followed.

EARLY POEMA.—This is a book of verse, by Mr. T. G. Henslow, and it includes some three hundred poems, some of them, however, consisting only of a single verse. The author tells us in the preface that he does not approve of poets limiting their published verses to what they themselves consider to be their best efforts, but on the contrary, prefers to publish them all and let the public select those of which they

MOSSY SAXIFRAGES.

THE genus *Saxifraga* includes some of the most valuable plants for the rock garden, and consists of several distinct groups. For example, some species are adapted for planting on hot, sunny ledges, others for cool, shady banks, whilst a few succeed only in boggy places, or even with their roots in running water. They vary in habit to a remarkable degree, such extremely small species as the diminutive *S. ciliaris*, with its tiny rosettes of leaves and corresponding sprays of flowers, differs so much from the larger species of which the Californian giant *S. peatata* may be cited, as to appear at first sight to have little in common.

As a whole the Rockfoils are easy to grow, and

burn in drier places much exposed to the sun. The illustration in fig. 75 shows a growth of these Rockfoils in the rock garden at Kew, and includes most of the species and varieties described below.

S. CARPETOSA. This plant is a native of the Northern and Arctic regions, and is very variable in habit. Many names have been given to the different forms of this species, among which may be mentioned *S. depiciens* and *S. spionhemii*, but, although the extreme forms may be quite distinct, they are linked by a chain of intermediates which makes it difficult to draw a line between the various so-called species and varieties. One of the most marked varieties is *S. c. var. hirta* with very hairy foliage. The wild plant has white flowers, the red colour seen in the newer forms of *S. carpetosa* being due to

FIG. 75. MOSSY SAXIFRAGES IN THE ROCK-GARDEN AT KEW.

(Photograph by C. P. Ruffell)

most approve. Thus there is great diversity of subject in the volume before us, and inequality of style and expression, at the same time those interested in gardens, birds, and natural history generally, will doubtless find many of the poems of great interest. Miss HARTLEY'S sketches are occasionally very appetising, and they should add much to the value of the book.

PUBLICATIONS RECEIVED.—*Enquiry into Plants, and Minor Works on Odours and Weather Signs.* By Theophrastus. With an English translation by Sir Arthur Hort, Bart., M.A. In two volumes. (London: William Heinemann, New York: G. P. Putnam's Sons) (Series, *The Loeb Classical Library*.) Price 5s.

• *Early Poema.* By T. Geoffrey Henslow, M.A. With illustrations by Miss D. Hartley. (London: *The Gentlewoman*.) Price 5s.

or need to be planted in suitable situations. A good general rule for planting is, sunshine for those with hard, crusted, and leathery leaves, although there are a few exceptions, and shade or half shade for those of the mossy or soft-leaved section. Many of the latter group form lovely carpets or mounds of deep emerald green foliage, very beautiful in winter, and covered in spring and early summer with masses of pure white or rose-pink flowers.

The mossy Saxifrage crosses freely, and hybridists have given us many fine varieties. Certain of the taller hybrids are of a rather woody character, evidently due to the influence of *S. granulata*, which has tended to develop a taller and less graceful habit.

Rich, moist, and well-drained soil is essential for Mossy Saxifrages, many of which tend to

the influence of *S. muscoides* var. *atropurpurea*, a charming little plant with bright red flowers. One of the first hybrids was Guildford Seedling, a very dwarf carpeting plant with bright crimson flowers. *S. Chiriana* is of rather stronger habit, with red flowers, while *S. bathonensis* grows nearly 1 foot high, with much-branched stems, and has large, brilliantly red flowers. *S. sanguinea superba* is of neat habit, and has rich ruby scarlet flowers that retain their colour well for some time.

S. EXARVIA. A distinct and beautiful Saxifrage from the Pyrenees, forming close, compact tufts of bright green foliage that is completely covered by a mantle of white flowers in summer. The plant grows only two or three inches high, the thin, waxy stems being rigid and freely branched.

S. GLOBULIFERA.—A free-blooming species from the Western Mediterranean region. It is somewhat similar in general habit to *S. Wallacei*, and produces white flowers in May and June.

S. HYPNOIDES.—The "Dove-tale Moss," with its emerald green carpet, is a well-known plant in gardens. During the winter it is one of the chief attractions in the rock garden, clothing otherwise bare places with a permanent mat of beautiful green. The white flowers appear in profusion in spring and early summer. Named varieties of this species are numerous, one of the closest and most compact being *gemmifera*; *variagata* has foliage prettily variegated white and green.

S. MUSCUIDES.—This is a dwarf, dense, carpeting species, with yellowish flowers in the type, forming a moss-like turf. *S. m. var. atripurpurea*, with bright red flowers, is the source of all the fine red hybrids that we possess.

S. TRIFURCATA.—An elegant species from Northern Spain, forming a carpet of rosettes with three parted leaves that are stiffer in texture than most in this section. The pure white flowers are borne on stems two or three inches high, in graceful sprays. The variety *ceratophylla*, which is known as the "Stag-horn Rockfoil," has more deeply parted leaves of a still more rigid character than in the type.

S. WALLACEI.—This species is one of the best of this group, with distinct foliage of a light green colour, and large, white flowers that are sweetly scented. For spring bedding or for borders, it is a very attractive plant, producing flowers freely, and lasting for a long time in perfection. *S. Wallacei* is of garden origin, but was considered at one time to be synonymous with *S. Camposita*, a Spanish plant with less hairy leaves and stems. **H. L.**

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE VALUE OF SUN HEAT (see p. 185).—I have grown Tomatoes successfully for many years by means of bottled-up sun-heat, and, as in the present year, have had other crops part of the time in the same houses. Young Onions, Carrots, and Cauliflowers are benefited by the heat as well as the Tomatoes. But French Beans planted in one house as an edging slightly wilted during the recent intense heat, when the temperature in the house for several hours daily ranged above 100°; otherwise they showed no bad effects, and the flagging was only temporary, just as Turnips and other vegetables will in very hot sunshine. Lettuces grow to abnormal bulk in late spring. Plants of *Primula obconica* have been badly touched by the flowers, not the leaves. There is a limit at which the Grape Vine shows resentment. Heat can be saved by keeping vineries close till the growths have developed an inch or two, but the Vines must have air when in full growth. The chief point to remember in growing these with a limited fire-heat is to ventilate very early in the day, but not enough to lower the temperature, and, unless in very hot weather, that will suffice for the whole time; there is danger from the sun. My experience leads me to disagree with the advice to increase moisture with increase of temperature. Provided the roots are properly moist, a saturated atmosphere is not essential; on the contrary, it leads to etiolated growth. I wonder if many of your readers have noticed that red spider breeds in just such an atmosphere as that recommended. **R. P. B.**

CHIONODOXAS (see pp. 169, 186).—I am glad to observe Mr. William Cuthbertson calling attention to *Chionodoxa Tmolii*. It is the latest of the *Chionodoxas*, and merits all the praise given it by your correspondent. May I ask, however, if Mr. Cuthbertson has tried Boissier's variety of *C. Luciferae*? It approaches more closely in its colouring to *C. Tmolii*, but has perhaps more of a red blue tone than is apparent in *C. Tmolii*, which has a shade of purple about it. It was interesting to read in Sir Herbert Maxwell's article that he had picked up *C. sa* in Asia Minor. *C. sardensis* varies, but I believe that the first records of *C. sardensis* in this country spoke of it as blue to the centre, and most of my plants of this species are so coloured. Mr. Edward Whittall informed me that both the white-eyed and other forms were found. *C. gigantea* is, as Sir Herbert Maxwell states, inappropriately named *gigantea*; *grandiflora* would have been better, but the claims of priority appear to have decided in favour of *gigantea*. *C. Allenii* apparently runs into *C. gigantea*, but Allenii, as described by Mr. Whittall and Mr. Allen, should have more than one flower on a scape. I have collected bulbs of Allenii and *gigantea*, which vary greatly, and some are exceedingly fine and worthy of propagation. I have also here *C. nana*, the smallest and least attractive of the *Chionodoxas*, and now a rare plant. *C. Tmolii* seeds with me occasionally. **S. Annett, Sunningdale, Maidenhead, Dumfriesshire.**

BRUSSELS SPROUTS.—I presume the majority of gardeners will agree that all winter vegetables, Brussels Sprouts are the most profitable, notwithstanding the fact that Savoys may give a larger gross weight. We are still using Sprouts that commenced to yield seven months ago, and have the greater portion of the crop for 1917-8 planted between the rows of the present crop. No vegetable is so easy to produce, given time and sufficient space for each plant to develop, and the plant is perfectly hardy. **R. P. Hetherington, East Lothian.**

PLANTING VIOLETS.—Mr. Guise has advised on two occasions recently (see pp. 135 and 163) the planting of runners from the old plants of Violets "with roots adhering if possible." May I point out that this method of propagating Violets from practically exhausted stock has been for many years superseded by that of propagating from young runners at framing time in autumn. At that time use can be made of the superfluous growths when trimming the plants, and these inserted as cuttings and rooted, and need not only a four or five months' start over those advised by Mr. Guise, in April, they have youth and vigour also in their favour, and are free from the weakening effects that follow frame culture for a period of months. One of the plants I recommend is ample to put out in any station, whereas Mr. Guise finds it necessary to put "two or three crowns together." On March 27 last Mr. James C. House gave an address on "Violets and Violet Growing," before the Fellows of the Royal Horticultural Society, and one of the points on which he laid strong emphasis was autumn propagation of the plants to ensure the best results. As I practised this method myself for many years and knew its worth, I gave it my hearty support. **E. H. Jenkins.**

— I have frequently practised the method described by Mr. Jenkins, but can see very little difference in the quantity or quality of the flowers than are obtained from the method I advocate, apart from the extra work entailed (a very important item during the present scarcity of labour). However, these "exhausted" and "weakened" runners, planted in the manner described, gave an abundance of flowers of superior quality during the past season. The results were so satisfactory that I have adopted the same method this year, making the third year in succession. **W. J. Guise.**

"MYSTERY MANURES" (see p. 115). I read with much interest Dr. H. E. Durham's remarks on his trials with manures. Some experiments came under my notice in connection with these manures, and I have obtained from the experimenter, Mr. C. Cutts, The Gardens, Benchams, Harford, Devon, the following particulars of the same: Six pots of dwarf Beans were planted January 17, 1916: Set 1, two pots untreated; set 2, two pots bacterised peat (1 part in 8 of soil); set 3, two pots Bito (1 part in 8 of soil). Crop picked from April 2 to 9, 1916, as follows: Set 1, 1 lb. 2 oz.; set 2, 1 lb. 12 oz.; set 3, 2 lb. 1 oz. Three 14 in. pots of climbing French Beans were also planted January, 1916. Six Beans in a pot: 1, untreated; 2, bacterised peat (one part in 8 of soil); 3, Bito (1 part in 8 of soil). Crop picked from April 2 to 14, 1916. 1, 1 lb. 4 oz.; 2, 10 oz.; 3, 1 lb. 9 oz. **L. L. Smith, Houthfield, Sudmouth.**

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

May 8.—*Present*. Mr. H. J. Elwes (in the chair), Sir Everard in Thurn, Messrs. W. Fawcett, J. Fraser, W. Hales, J. Odell, G. Wilson, E. A. Bowles, F. J. Chittenden (hon. sec.) and R. Farrer (visitor).

Prunus spinosa forms.—Mr. J. Fraser showed dried specimens of a number of forms of *Prunus spinosa*, including the variety *macrocarpa*, which he regarded as a hybrid between *P. spinosa* and *P. communis*.

Narcissi.—Mr. Bowles showed flowers of the uncommon *Narcissus dubius* and the rare white form of *N. muticus*, which seems so difficult to grow and establish in this country.

Various Plants.—Mr. Elwes showed *Iris Wattii* grown in a cold house, where, like *I. fibriolata*, it succeeds much better than outdoors, good flowering being apparently necessary before a good flowering spike can be developed; *Fritillaria gracilis*, which Mr. Bowles introduced from Montenegro; *Habenanthis pratensis*; *Alpinia Elwesii*, from Formosa; *Arundina bambusaefolia*, from India, an Orchid rarely grown well now; *Rehmannia elatior* and R. Henryi, both cold-house plants; and *Cymbidium devoniensis*.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

April 16.—*Committee present*: The Rev. J. Crombholme (in the chair), Messrs. R. Ashworth, D. A. Cowan, J. C. Cowan, Dr. Craven Moore, A. G. Ellwood, J. Evans, P. Foster, J. Lupton, D. McLeod, W. Shackleton, and H. Arthur (secretary).

AWARDS.

FIRST-CLASS CERTIFICATES.

Odontioda Bradshawiae var. *Columbia*, *O. Lambearianum* var. *Ruby* (*C. Noeliano* × *Odm. Lambearianum*); *Cymbidium Alexandri* var. *Celeste* (*eburneo-Lovii* concolor × *insigne*), and *C. Murs* (*eburneo-Lovii* × *insigne roseum*), all from Dr. Craven Moore.

Cattleya Cowanior alba and *Miltonia Bleania* var. *Primo*, both from R. Ashworth, Esq. *Odontoglossum Mirum Haddon House* var. (*Wilckeanum* × *crispum Lucianum*), from P. Smith, Esq.

AWARDS OF MERIT.

Odontioda aurea var. *Beauty* (*Odm. luteo purpureum Fyulsteeki* × *Oda. Charlesworthii*), *O. Tigris* (*Charlesworthii* × *harvestensis*); *Odontoglossum Zoe* (*Fyulsteeki* × *Crawshayana*); *Cattleya Schröderiae* var. *Mauve*; and *Cypripedium Gregii magnificum* (*niveum* × *Godefroyae*), all from P. Smith, Esq.

Odontioda Zenobia var. *Hamilton*; *O. Lambearianum* var. *Hazel*, both from Dr. Craven Moore.

Odontioda Madeline var. *Oporto*, from R. Ashworth, Esq.

AWARDS OF APPRECIATION.

FIRST-CLASS.

Odontioda Bradshawiae var. *Anglia*, *O. Madeline* var. *Diadem*, and *Odontoglossum illustissimum* var. *K. of K.*, from R. Ashworth, Esq.

Odontoglossum Lady Mounds (*crispum* × *lochritense*), and *O. President Wilson*, from S. Gratrix, Esq.

Odontioda Elaine (*Odm. Lambearianum* × *Oda Charlesworthii*), from Dr. Craven Moore.

CULTURAL CERTIFICATES.

Mr. J. Lupton, for a plant of *Cymbidium Parishii Beardwood* var., carrying four spikes of flowers.

Mr. E. Rogers, for a specimen *Eulophiella Elizabethae*, with two flower-spikes from one pseudo-bulb.

GROTES.

Large Silver Medals were awarded to R. Ashworth, Esq., Newchurch (gr. Mr. Daynport), and Dr. Craven Moore, Victoria Park, Manchester (gr. Mr. T. Arran), and a *Silver Medal* to Messrs. Cypher and Sons, Cheltenham.

NATIONAL AURICULA AND PRIMULA (Midland Section).

MAY 4, 5.—This society's eighteenth annual exhibition was held in the Birmingham Botanical Gardens on the above dates. There were fewer exhibits than usual, and the quality of the flowers was inferior to that of previous years. The weather was beautifully fine on both days, and there was an unusually good company present. It is gratifying to note that the "gate" constituted a record.

The premier Show Auricula Shirley Hibberd (green edged) was shown by Mrs. CHARLES WINN, who also had the premier Alpine Auricula Muriel (gold centre). The premier seedling Show Auricula Susie (self), came from Mr. C. S. YEOMANS, and Mr. J. D. WILLIAMS sent the premier Alpine seedling Auricula Kathleen Mary (gold centre).

The Silver and Bronze Medals offered to the most successful exhibitors were won by Mrs. CHARLES WINN and Mr. A. J. WADLEY respectively.

The Ludford Silver Medals for (1) Show Auricula and (2) Alpine Auricula, were won by Mr. J. D. WILLIAMS. The James T'dale Silver Medal was secured by Mr. E. KENWRIGHT.

There were four honorary exhibits, to which the following awards were made:—*Gold Medal* to Miss POPE for 200 vases of Daffodils; *Silver Medal* to Mrs. CHARLES WINN for Schizanthus and Stocks; *Bronze Medals* to Mr. C. S. YEOMANS for Polyanthus; and Mrs. CREED KEELING for Daffodils.

HORTICULTURAL CLUB.

LECTURE ON NARCISSUS DISEASE
(See also p. 204.)

MAY 8.—On the occasion of the usual monthly dinner of the Horticultural Club, at the Hotel Windsor, on Tuesday, May 8, Mr. J. K. RAMSBOTTOM gave the results of his investigations of Wisley of a disease of Narcissus which has been attributed by some authorities to the fungus Fusarium.

The chair was occupied by Mr. H. R. DARDINGTON. There was a large attendance, including many specially interested in the cultivation of Daffodils, both traders and others. Mr. RAMSBOTTOM'S remarks were illustrated by lantern slides. As will be seen from the article on p. 204, Mr. RAMSBOTTOM has been forced to the conclusion that the malady is due to *colwurm*, *Tylenchus devastatrix*. He stated that *Tylenchus devastatrix* was first described by Julius Kuhn in 1858 as being the cause of a disease in *Dipsacus fullonum*, the fuller's Tansy, under the name *Anguillula Dipsaci*; but as Kuhn afterwards found that the same *colwurm* could attack Oats, Buckwheat, and other plants, he considered the name *Anguillula Dipsaci* too restricted, and disregarding the customary rules of priority, changed it to *Anguillula devastatrix*. Botanists who did important work on the classification of *colwurms* about 1860, incorporated the *Anguillula devastatrix* with several other *colwurms* in the new genus *Tylenchus*, and the *colwurm* with which we are now dealing became known as *Tylenchus devastatrix*, Kuhn. In 1881 Prillieux worked on the *colwurm* malady of Hyacinths. To this *colwurm* he gave the name of *Tylenchus hyacinthi*, while in 1903 Beijerinck published a paper on the *colwurm* malady of Onions, which at that time was spreading rapidly throughout Holland, and which he attributed to *Tylenchus Aili*.

In 1908 Ritzema Bos definitely proved that *Tylenchus hyacinthi*, *Tylenchus Aili*, and *Tylenchus devastatrix* were one and the same species. The same worker in the valuable contribution, *L'Inguille de la Tige*, gives a list of some forty plants which are susceptible to the attacks of *Tylenchus devastatrix*. This list includes, among our principal food crops, Rye, Oats, Onions, and Clover, and in a less degree Barley and Wheat. Among flowering plants, Hyacinths, Scillas, and Galtonia candicans are included in the list. Narcissus is not, however, mentioned. Some of our commonest weeds, such as Sweet Vernal Grass, Meadow Soft Grass, Annual Meadow Grass, Buttercup, Daisy, and Plantain are also liable to infection.

In 1900 Ritzema Bos put forward the bio-

logical strain theory, which, in brief, is that *Tylenchus devastatrix* becomes so adapted to a particular species of host plant after growing on it for several generations that it will not attack with any severity any other species. Further, taken from such a second species, it will not attack the original host with severity until after several generations have passed. For instance, the Narcissus strain will not affect Onions with any severity, and *vice versa*, although the two strains are absolutely indistinguishable from a morphological standpoint. In like manner it has been suggested by several investigators that the root-knot *colwurm* *Heterodera radicola* may show similar biological strains with no apparent morphological differences.

In conjunction with the series of inoculation experiments performed last September, and to which reference has been made, Mr. RAMSBOTTOM carried out experiments to test the truth of this theory. Healthy bulbs were planted in sterilised soil and Onion seed sown on the surface. The pots were watered twice with *colwurm* cultures, the *colwurms* being originally taken from Narcissus bulbs at the interval of a fortnight. The *colwurms* had their original diet to feed upon, but in contribution to the biological strain theory, all the seedling Onions were attacked. Another similar experiment was made

tions that the disease commences in the neck of the bulb. The leaves at the surface and below the ground level become a decayed, squashy mass, and in consequence they lose their elasticity and topple over in all directions. These leaves do not show the twisting characteristics of the diseased foliage from a diseased bulb. This decay in the neck is usually evident in late May and early June, at a time when the foliage is withering, and the symptom is sometimes confounded with the natural decay of the leaves. Many growers are of the opinion that moist, dull, warm weather favours the spread of the disease at this stage, and such conditions possibly aid the development of *colwurms* and render them more active. Exactly how the *colwurms* gain an entrance has yet to be shown. It is generally believed that foliage injured by frost and other external agencies offers a ready means of access. This may be so, but the best inoculation experiments prove that *colwurm* is capable of itself gaining an entrance owing to its possession of a spearing apparatus—a needle-like structure present in its gullet. In the case of a healthy bulb planted in infected soil, the hard, brittle outer scales would afford natural resistance to the entrance of the *colwurm*, and in preference it would attack the soft-growing foliage. In any case, the *colwurms* usually attack the leaves at the neck, and this is a possible explanation of the decaying of the foliage at this point. Once inside the leaves, the *Tylenchus* makes rapid downward progress to the basal plate, where it appears to find better conditions of growth. Here the *colwurms* propagate most freely, the basal plate splits away from the bulb, and often the *colwurms* are to be seen in masses resembling cotton-wool hanging from the base. At this stage the *colwurms* leave the bulb by way of the broken basal plate, enter the soil, attack other bulbs, and so spread the disease. The bulb rot and fungi, possibly including *Fusarium*, then gain an entrance.

Where the flowers are gathered as in the case in the Daffodil flower industry, where the flowers are picked in the bud stage and opened indoors, the wound so left affords a ready means of entry for *colwurms* from the soil. In order to obtain a long flower stem, the stalks are picked as far into the neck as possible, sometimes below the ground level, and an ugly wound results. No bulb treated in this manner can be expected to remain free from disease in an infertile soil, and the practice doubtless helps to spread *Tylenchus*. Wherever it is practicable, the flower stalks should be cut an inch or so above the ground.

When bulbs are in a dormant state, it is a very difficult matter to distinguish a healthy bulb from one which is slightly diseased; in fact, it seems impossible without cutting open the bulb. Bulbs have been carefully hand-picked, and those passed as apparently sound have been "trayed" within a fortnight. They have then been re-examined and numbers have been destroyed as unsaleable. This goes on and on, so that it is not surprising to hear the remark that the disease spreads rapidly in storage. In all probability, this is not a case of a diseased bulb affecting its neighbours, but rather that the bulbs passed as sound were slightly diseased, and after a week or more the *colwurms* had made their efforts recognizable. That such seems likely is seen from the following: Healthy bulbs have been placed in trays among diseased ones and left over a period of three months, at the end of which time those affected were a decayed and rotten mass and the healthy bulbs still plump and hard, but probably not free from *colwurms* on their outer scales. No trace of *colwurms* could be found inside the healthy bulbs. It is not to be implied that no harm will result by storing the bulbs in bad conditions. Certain factors, such as humidity of atmosphere and variations of temperature may help to bring about the decay of bulbs very rapidly.

(To be continued.)

ENQUIRY

CARP AND TENOR.—I am much troubled with blanket weed in my pools. Copper sulphate checks it for a time, but afterwards the weed is as troublesome as ever. Where can I buy carp or tench to put in the pools?—I G.

THE LATE CAPTAIN HARRY SANDERSON.
(See note on p. 100 in last issue, p. 197.)

by sowing Onion seeds in sterilised soil in pots and watered once before germination with the Narcissus strain of *colwurm*. Six weeks after sowing, although the seed showed a moderate germinative capacity, practically none of the seedlings carried the seed back at their tip, and abnormal twisting or bending was very noticeable. The young plants were of a lighter green colour than those in the control pots. The seedlings in the infected soil gradually died off, and on examination were found to contain *Tylenchus* in numbers.

Scilla nutans has also been successfully inoculated with the Narcissus strain of *Tylenchus*, and other crops are under observation. This phase of the subject was treated in detail because it opens up a very wide field, and of great economic importance on account of its bearing on the rotation of crops. For instance, in parts of the country where bulbs are grown in rotation with agricultural crops, it will be of little use in attempting to control Narcissus disease to grow crops liable to infection, and in which *colwurm* can tide over until the ground is again occupied by bulbs.

An important question under consideration is to ascertain in what manner bulbs become affected. It would appear from field observa-

CROPS AND STOCK ON THE HOME FARM.

ROOKS AND THE CORN CROPS.

At times there is much contention as to the good and harm rooks do on the land. I have always been an enemy of these birds, knowing well the damage they do to the corn crops and roots at certain periods as compared to the small amount of good they do in clearing the land of gnats of insect pests. Rooks have been more troublesome this season than ever in my experience, especially where much Wheat was sown late owing to unfavourable weather. The seed lay dormant in the soil for a long time owing to frost, and the rooks had a fine time; even during frosty weather, after the soil became powder dry, they were able to find the seeds. I have seen acres of Wheat this year with a bad promise of a crop owing entirely to these birds taking the seed. Under the Defence of the Realm Act, Agricultural War Committees have power to reduce the number of rookeries in districts where it is known the birds do harm to crops.

VETCHES FOR HORSES.

No time should be lost in sowing two bushels of Vetches per acre with half a bushel of Oats broadcast for green food for horses during August and September. This is an excellent change for the cattle, and is economical, reducing the Oat supply at a time when this grain may be required for other purposes.

SUNFLOWERS FOR POULTRY.

The common Sunflower (*Helianthus annuus*) will give good returns in hot summers to poultry keepers, as the heads produce a quantity of seed which contains much oil. The plant grows freely in well manured, deeply ploughed land, often reaching a height of 8 feet, and bearing large heads. Sow in drills 2 feet apart.

MAIZE

Maize should be sown during the second or third week in May. Well ploughed and fairly manured land, as a suitable preparation; a slight scattering of superphosphate with the seed will act as a substitute for farmyard manure. Sow the seed about 8 inches apart in each plough furrow, burying it about 4 inches deep, which is better than drilling, as when nearer the surface rooks are troublesome, and once they find the seed they quickly clear large patches.

TRIFOLIUM HYMENEUM.

This Clover should be grown more extensively, as it forms valuable food in May and June for cattle, and if not required as green food, may be made into good hay. The rolling of all cereal crops, Vetches, Sainfoin, Clover and Grass, should be done at once, not purely for the purpose of solidifying the fodder and Hay crops, but for the pressing down of stones which might otherwise inconvenience cutting operations.

DESTRUCTION OF MOLES.

Moles are very troublesome in some districts, although some would have us believe they are useful. The hillocks of soil which they throw up are very dangerous to the operator on the grasscutter, hidden as they are sometimes in a thick Clover crop. Trapping should be rigorously carried out to exterminate the animal.

ITALIAN RYE GRASS.

This crop should be sown now, using 1 bushel of seed per acre, as spring food for sheep, to be ploughed up afterwards and the ground sown with Turnips. The plant grows quickly, and cold weather does not affect it. The stems are succulent, and provide a diable food for lambs and cows. Sown among Oats or Barley early in May, with the hand-sown barrow, harrowed in and rolled, Italian Rye-grass germinates quickly and grows rapidly. *E. Moloney*.

LATE SPRING SOWING.

Spring sowing is late this year, and in some cases there may be difficulty in the choice of a crop. As no guarantee of a minimum price has been given for Barley, an impression seems to

be abroad that it is a less desirable crop than Oats. This is quite wrong. Without any guarantee, farmers can rely on the price of Barley being nearer to that of Wheat than to that of Oats; and, in the national interest, on suitable land, Barley is to be preferred. It is better for mixing with Wheat, both as flour and, since they can be milled together, as grain. Hence farmers, as far as possible, should sow Barley instead of Oats. Any of the ordinary varieties, except Archer's Stiff Straw, can be sown as late as the middle of May.

When it is too late to sow the usual spring corn crops, one of the following may be found useful:—

(1) Linseed on medium or rather heavy soils. It does well after old grass, and can be sown up to the end of May. If seed cannot be obtained locally, it can be supplied by the British Flax and Hemp Growers' Association, 14, Victoria Street, London, S.W. 1.

(2) Buckwheat, on fen land and thin sandy soils, can be sown in late May or early June. Buckwheat flour may be mixed with Wheat flour for bread-making.

(3) Besides the more usual crops, mixed Oats and Vetches, or Oats and Peas, if sown before the end of May, will prove useful either in late summer as green food, or for making into hay or silage. In the Eastern and Southern Counties another useful succulent forage crop is Maize, especially when the pastures fail in autumn. Sowing may be carried on till fairly late in June. It is desirable to take special precautions against rooks and other birds.

Further particulars about these crops may be seen in a leaflet which can be obtained from the Food Production Department of the Board of Agriculture.

TOP DRESSING OATS.

The President of the Board of Agriculture and Fisheries urges upon farmers the importance of top-dressing Oats and "seed" hay. The wet autumn and cold spring have impoverished most soils. Production is needed, and at present prices fertilisers will be amply paid for by the increased yield. The hay crop, where it consists largely of Rye-grass, should receive a dressing of $\frac{1}{2}$ cwt. of sulphate of ammonia per acre. If, however, it consists chiefly or entirely of Clover it should not be top-dressed. Top-dressings for hay should be applied now in the earlier districts, and before the 20th inst. in the latest districts. On all land which is not already in high condition a dressing of $\frac{1}{2}$ cwt. sulphate of ammonia to Oats is likely to prove very profitable this season. Oats which received no sulphate of ammonia when the crop was sown may be top-dressed at any time until the leaf is 4 to 5 inches long. The President also reminds farmers that Barley may be sown with success during the whole month of May. Either as bread-corn, or as concentrated food for live stock, the grain will be invaluable. Farmers are therefore urged to sow the largest possible acreage of Barley on any land that is available, even though by so doing the acreage they propose to allot to roots is reduced.

CIVILIAN PRISONERS AS FARM LABOURERS.

Among the sources of labour now open to farmers, civilian prisoners of war should not be overlooked.

There are many Austro-Hungarian and Turkish subjects in the various internment camps with a practical knowledge of farm work. The conditions governing their release have now been amended, and they can be employed almost anywhere, except in the neighbourhood of the East Coast. When employed they have almost always given satisfaction. Forms of application can be obtained from the Secretary of the Agricultural Executive Committee for the county.

SCHEDULE RECEIVED.

National Dahlia Society's Annual Floral Meeting, to be held in conjunction with the Royal Horticultural Society's meeting on Tuesday, September 11, 1917, in the Drill Hall, Buckingham Gate, Westminster. Hon. secretary, Mr. Jas. B. Riding, Forest Side, Chingford.

ANSWERS TO CORRESPONDENTS.

LIVES INFESTED WITH ISLE OF WIGHT DISEASE: *J. B.* The best method of treating the hives that are infested with Isle of Wight disease is to char the insides thoroughly by means of a blow-lamp. Let the flame penetrate into all the crevices, even if the wood work is scorched in so doing. You must treat the frames, sections, racks, and other parts in the same manner, and burn the old wax. Choose a fresh site for the apiary, as the disease may be harboured in the soil.

NAME OF PLANT: *J. A.* *Dendrobium chryso-toxinum*, a native of Barmah.

PEAS EATEN BY INSECTS: *C. B.* The insect is that known as the Pea and Clover weevil (*Sitona lineatus*, Linn.). It is very injurious to the foliage of Peas, Beans, and other Leguminous crops. As you will have perceived, it begins its work at the edges of the leaves, and gradually eat its way inwards towards the rib. It is difficult to advise you as to means of curing the attack, or preventing its recurrence. It may assist you, however, to know that the eggs of the weevils are laid, during the summer, at the roots of the Peas; during the winter the eggs become chrysalids and the chrysalids maggots, which become at the approach of warm weather perfect beetles. The beetles usually feed at night, and one good way of destroying large numbers is to go out after dark with a lantern and knock or brush them off the leaves into a pail of insecticide. Further, they do most mischief in dry weather, which makes it probable that damping the foliage, especially with some disagreeable liquid, would prevent their attacks. The same purpose would be served by a layer of soot spread over the ground beneath the Peas. It should also be remembered that the best protection any plant has against the attacks of any sort of pest is free, healthy, rapid growth. Any treatment which secures this will be of advantage.

POTATOS - *Shm* The tubers are slightly affected with dry scab disease (*Sponylobolium atro-virens*). The disease is not a serious one, and the tubers may be used for planting.

SUGAR BEET AND BOTTLED PEAS: *E. T.* Sugar Beet as a crop is not so useful as ordinary garden Beet, which is rich in sugar and other valuable food, not difficult to grow, and perfectly simple to cook. Most people spoil cooked Beetroot by immersing it in vinegar; but simply boiled and cut in fairly thick slices, if desired with white sauce (un-flavoured), it makes a delicious vegetable or supper dish. As regards making jam with Sugar Beet, this has been tried by many of our readers with varying results. The general opinion is, firstly, that the Beet takes eight or nine hours' steady boiling before it is really soft; and, secondly, that when it is finally in a state of pulp, nearly all the sugar has been boiled out into the water. Fruit can be preserved without any sugar at all by means of air-tight bottles, filled with the fruit and water, and, after sterilising by heating, sealed with mutton fat. Peas will keep very well as a rule when bottled, and we are surprised at your want of success. The method usually recommended is as follows:—Place the Peas in dry, wide-mouthed bottles, shaking them down until they are tightly packed. Wind some Hay round the lower part of each bottle, and place them all upright in a large sauceman with cold water enough to reach to the necks. Bring the water to the boil, and keep it boiling for two hours. Cork the bottles, and leave them in the water until it is cold. Then remove the bottles, cover the corks with sealing wax to exclude all air, and store the bottles in a cool, dry place; a good plan is to bury them completely in a dry part of the garden. If all air is excluded the Peas will keep for about five months.

Communications Received—*W. R. Wright* (Thanks for 4s. sent for R.G.O.F.); *T. H. W. Smith*—*Prof. E. S. S. Arnold* (Aberdeen, U.S.A.—R. T. W. (May 4th); we will send it possible).

MARKETS.

COVENT GARDEN, MAY 19.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Aralia Sieboldii, Asparagus plumosus nanus, Aspidistra, Beronia, Cacti, Cineraria, Cocos Weddelliana, Erica, Ferns, and Cut Flowers.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Arums, Carnations, Dahodis, Heather, Iris, Lily of the Valley, Narcissus, and Orchids.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Beans, Broccoli, Broad Beans, Cabbage, Carrots, Cauliflowers, Celery, Chicory, Cucumbers, Endive, Green Beans, Garlic, Herbs, and Horseradish.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Almonds, Apples, Bananas, Cranberries, Dates, Figs, Grapes, and Nuts.

Remarks: A few boxes of Apples are still available, the chief varieties being Oregon and Winesap. Supply of grapes are increasing daily mostly Muscat, Black and Blue. Beans and Peas are fairly plentiful but French Asparagus is almost gone. English Asparagus from Worcester, Devonshire, Middlesex and Cambridge is plentiful. Cabbage and the Lettices are scarce and other ordinary vegetables are sufficient for the demand.

THE WEATHER.

THE WEATHER IN SCOTLAND. The week ending 1916-17 has been in the lap of spring that even till mid-April its severity was but temporary. Snow fell frequently, while the temperature in the screen seldom fell as low as 18°. On the whole the month was a dry one, the total rainfall being only 1.28 inch. There were thirteen days of precipitation, and nine rainy days, 12.5 days on which the rain gauge collected 0.04 inch or more. The heaviest fall was 0.26 inch, on the 15th of June, when there were in all 12.86 hours, being an average of 4.3 hours per day, and a percentage of 30. There were only two days on which the sun did not appear. With a mean of 29.818 inches the barometric pressure varied from 30.536 inches on the 22nd to 29.152 inches on the 14th. The highest temperature for the month was 63° on the 22nd, and the lowest 38° on the 1st, giving an absolute range of 25°. The lowest maximum was 37° on the 1st and 2nd, and the highest minimum 47° on the 26th. The means for the maximum and minimum were 48° and 33° respectively giving a mean range of 15° and a mean temperature of 50.5°. On fifteen days the temperature fell below the freezing point. On the grass the mean minimum was 28° the lowest of 17° being recorded on the 1st. There were seventeen nights of ground-frost. At 1 foot deep the soil temperature fell from 38° to 37° and then rose to 46°. Snow fell on seven days. The prevailing winds were from the north-west. James Malloch, St Andrews Training College Gardens, Kirkton of Warr, near Dundee.

GARDENING APPOINTMENT.

Mr Thomas Williams, for over 25 years Foreman in the Nursery, Garden, Flower, and Fruit Department, is now Gardener to Lord Clonsilla, Clonsilla, Clonsilla, Co. Galway.

THE ONLY DIRECTORY OF GARDENS AND GARDENERS.

The Horticultural Directory and Year Book for 1917 is the ONLY Directory that exists of gardens and gardeners in the British Isles.

If you want a list of all Nurserymen and Seedsmen, Sundriesmen, Hot-house Builders and other traders closely connected with horticulture, consult the ONLY Horticultural Directory.

Should you desire to trace the whereabouts of the young men you associated with in the Botany you have no other means of finding out their present addresses than by turning to the ONLY Directory of British Gardeners.

Obtain a copy and see if your own name is there, and if it is not, then send us particulars for inclusion in the edition for 1918.

The Year Book part of this unique volume contains descriptions of all the new plants, flowers and fruits certificated in 1916, notes on the principal gardeners who died during that period, and much additional information of great value to all amateur and professional horticulturists.

We are still able to offer some few copies of the current number. Readers are advised to send their orders early, before the work is out of print.

Apply, enclosing 1/4 for each copy required, to:—

GARDENERS' CHRONICLE, LTD., 41, WELLINGTON ST., COVENT GARDEN, LONDON, W.C. 2.

SUTTON'S VEGETABLE SEEDS
SUTTON'S FLOWER SEEDS
The Best.

SUTTON & SONS, The King's Seedsmen, READING.

BUSINESS METHODS—Experience in the way of a business shows that there are two ways of conducting a business, the one being to charge a high price for what is sold, exacting a high price for the customer, and a low price from another. The first method is to be condemned from a business point of view, mainly because it pains the customer's feelings, and he is ready to pay what he can get for what he is sold, exacting a high price for the customer, and a low price from another. The *Gardeners' Chronicle* adopts the alternative business method, that a business man's rates are based on the value of his goods, and he is ready to pay what he can get for what he is sold, exacting a high price for the customer, and a low price from another. It is not possible to grant concession, but the privilege of the paper to be in the position of a business advertiser that he pays no more than a fair price.

FOUR NEW PRIMULAS, collected by me in 1917: **P. hybrida** A.M., R.H.S., 3s. 6d. per 100; **A.M. R.H.S.**, 7s. 6d.; **P. yuccifolia** A.M., R.H.S., 1s. 6d.; **P. yuccifolia** A.M., R.H.S., 5s. PLANTS, &c., FOR SALE.

JAPANESE MAPLES.—Anyone who grows Shrubs at all should include some of the best of the Japanese Maples. They are among the most attractive plants for the edging of a shrubbery, for the border, and for planting in beds in the glass of a neatly kept lawn. Their chief characteristics are diversity of colour in many varieties; the tints are most brilliant and the attractive appearance of the leaves, which are dissected to such a degree that they attain a lightness and delicacy unapproached by the foliage of any other plant. They are perfectly hardy, most varieties having been known to withstand 30 degrees of frost (Fahrenheit) without injury. I have two thousand specimens of the beautiful genus, from 1 foot to 5 feet high, to be cleared at low prices in September and October next. They include the following varieties: *Aver palmatum purpureum*, *Aver palmatum dissectum*, *Aver palmatum lineatolobum*, *Aver palmatum lineatolobum* (Crippen's variety), *Aver palmatum sanguinatum* (various), *Aver palmatum rotundatum* (not dissected), *Aver japonica*, *Aver palmatum palmatum*, &c. The collection can be viewed at the address given below at any time before the autumn. **WILLIAM HANE**, Hawksworthy, Tunbridge Wells, Kent.

VERBENAS—Miss Willmott (pink), King of Scarlet's Queen of Whites, Lovely Blue (Lavender blue), Princess of Wales (purple), strong, clean, well-rooted stuff from boxes, 50 for 5s.; 9s. per 100; carriage paid for cash.—H. DUBBERIDGE, The Dorset Nurseries, Blandford.

ATROPA BELLADONNA plants, well rooted, 15s. per 100; 50 for 7s. 6d.; carriage paid.—JOHN CARLISLE, Barbon, Kirkby Lonsdale.

ANEMONE PULSATILLA.

THE long winter which we have recently endured seems to have stirred Anemone Pulsatilla, for it has flowered with the utmost profusion. It seems to revel in light sand, which becomes hot and dry in summer. Indeed, it is one of the few plants that can remain in this sand year after year and increase in beauty as it grows older. Experience has shown that in the case of most plants no amount of top-dressing can compensate on this sand for the lack of nutriment distributed through the soil, and that most plants no sooner get established and grow to be reasonable specimens than they begin to dwindle because they have exhausted the soil within reach of their roots. However, Anemone Pulsatilla seems quite satisfied with a yearly top-dressing of old leaf soil and chalk or lime. A well-grown plant bears as many as 40 or 50 blooms, which are followed by the 2 large heads of long-plumed seeds. The latter should be gathered as soon as they can be readily detached, and sown at once in pots or boxes. This is important for stale seeds either germinate very irregularly and scantily or fail entirely to germinate at all. When the seeds are sown at once, the seedlings appear in early autumn, and in some cases grow so rapidly in favourable seasons that they are ready by the following April to be planted out in their permanent positions. Sometimes, as, for instance, after a cold, damp autumn and hard winter, such as we have just experienced, the seedlings are better left in the seed pots, sunk to the rim in the open, until the following year. Plants and seedlings are best moved just when active growth begins in April, and there is then no great check, so that flowers may be expected in the following spring.

A few years ago I found on Monte Maiztotepe, near Fiume, a number of plants of a dark purple-flowered Anemone, to which several botanists give the name of montana. In the wild state, the plants seemed rarely to produce more than one flower, but one of the three plants which I dug up and brought back now has more than 20 flowers and the others each have several. The foliage is practically identical with that of Anemone Pulsatilla, and the flowers are covered with the same silky down that forms one of the charms of that flower. The colour of the flowers was always dark purple so far as I could see when I examined a number of plants in the wild state.

Some gardeners are content to admire the mere beauty of their plants and flowers, while

others are troubled by a desire to know where they come from and how they differ from their nearest neighbours. It was some such desire as this which led me to look up literature dealing with Anemones in the hope of finding the difference between montana and Pulsatilla, for though the flowers of the latter are usually pale purple, or even lilac, they are sometimes almost as dark as those of montana. Moreover, colour alone is hardly ever a true guide to specific difference. I found that the differences between the two species, as described in botanical literature, are somewhat vague. Some botanists hold that the leaves are differently divided, but seedlings vary in this respect, and the only real difference seems to be that, while

lilacs, for Pulsatilla. Anemones in a whole range of colour would be some compensation for the antipathy which many Anemones show for this hot and sandy soil. W. B. Pyles, Charleston, South Carolina.

A coloured plate of Anemone Pulsatilla rosea Mrs Van der Elst was issued as a supplement to this journal, January 25, 1915. (Enc.)

CRUSOE'S ISLAND: JUAN FERNANDEZ.

(Continued from page 208.)

STURKIE had the following effects: A tin stock of clothes, bedding, a musket, a pound of gunpowder, a quantity of bullets, a hatchet,

FIG. 70. ANEMONE PULSATILLA.

Pulsatilla turns its flowers up to the sun almost invariably and opens them out almost flat, the buds of montana droop, and the bell-shaped flowers continue to droop even when fully expanded. The stems only become erect as the petals fall off and the seeds begin to develop into the characteristic globular heads.

There is a beautiful variety of A. montana with flowers of what I can only describe as a bright chocolate colour. When it first flowered here, I could not resist the temptation to try whether it would cross with Pulsatilla, and the first seedling has just produced a first small flower of a colour which approaches nearly to a rich crimson purple. I shall await with interest the development of this batch of seed-

a knife, a kettle, a few pounds of tobacco, a flip-top, a Bible, and some books on navigation and mathematics, with his mathematical instruments and food sufficient for two meals. So he was much better provided for than poor William, the Indian. His grief was great at first, and for a considerable time he scarcely ate anything, nor did he go to bed until he could watch no longer. His melancholy remained for some months, but at last gradually wore off. "Contentual running and climbing about the rocks made him so fleet that the most nimble goats could not outstep him." He knew all the byways and paths on the mountains, could trip from one crag to another, and let himself down the most dreadful precipices." He built him-

FIG. 77. TREE FERNS IN THE VIRGIN FOREST OF JUAN FERNANDEZ.

self two huts with the wood of Pimento trees (*Pimento officinalis*), covering them with long grass, and lining them with the skins of goats. His Pimento bedroom was at first infested by cats and rats in great numbers, which had got on shore from ships that had put in for wood and water. The rats actually gnawed his feet and other parts of his body whilst he was asleep. In time he tamed the young cats, so that they kept off the rats, and it is related that they—the cats—used to lie about him in hundreds. So he had plenty of company in the night as well as the day time. When not hunting for food he employed some of his time in reading, singing Psalms, and praying, so that, as Rogers relates, "he was a better Christian while in this solitude than ever he was before, or than, he was afraid, he should ever be again." The Pimento wood, which burned with a clear light, served for both fuel and candle, and refreshed him with its fragrant smell. Whenever he had time to reflect on his condition, which was during the intervals of obtaining food, he yearned for the society of his fellow men. The monsters of the deep, the fur seals and sea elephants, with their terrible howlings, seemed to add to the terrors of his solitude. In the month of November the seals came on shore in such numbers in order to breed, that Selkirk could not pass through them to the shore, so thick were they. And if he approached them, they would not move out of his way, but run at him like angry dogs, so that it was dangerous for him to go near them.

Selkirk obtained plenty of "Cabbages," the young central part of an interesting endemic species of Palm (*Juania australis*; see fig. 78). It was most abundant towards the tops of the lowest mountains, and was somewhat difficult to collect, owing to the looseness of the soil, which is very shallow every where on the island on account of the volcanic origin of the land. Like most Palm trees, the Cabbage tree or "Chonta" of the Chilians has a straight trunk, with a bunch of leaves at

the top. The young heart is white, tender, and palatable. But in order to obtain the Cabbage it was necessary to destroy the tree. Rogers states that there were then great quantities of Pimento trees, some about 60ft high and bit, through. There was plenty of Turnips, the seed of which had probably been brought to the island by the Spaniards. He had also Parsnips and Watercress. Rogers says, "By degrees, by the force of reason, and a frequent reading of the Scriptures, and turning his thoughts on the study of navigation, after a space of eighteen months he grew thoroughly reconciled to his condition. When he had made this conquest, the vigour of his health, disengagement from the world, a constant cheerful, serene sky, and a temperate air, made his life one continual feast, and his being much more joyful than it had before been irksome. He now, taking delight in everything, made the hut in which he lay, by ornaments which he cut down from a spacious wood, on the side of which it was situated, the most delicious bower, famed with continual breezes and gentle aspirations of wind, that made his repose after the chase equal to the greatest pleasures."

Like his predecessor, William, the Indian, Selkirk hid himself when Spanish ships entered the bay. On one occasion he was seen and chased, but escaped by climbing a tall tree. His pursuers came to the base of the tree, but, not finding him, gave up the chase. One day he had a narrow escape from death when chasing a goat. He pursued it to the brink of a precipice, and in attempting to capture it, goat and man fell over. He lay unconscious for a considerable time, some accounts say twenty four hours, others three days, and when he recovered his senses he found the goat lying dead under him. He crawled painfully to his hut, and it was ten days before he was well enough to get about again. After his recovery he took the precaution, in case of further illness, of taming kids when very young, so that they recovered their health but not their agility. He slit the ears of a large number of goats, and as evidence of the great age of these animals it is recorded that on Anson's visit thirty-two years later several of these venerable creatures were still alive. Walter, who published an account of Anson's voyages, describes the capture of the goats as follows:—"Now it happened that the first goat that was killed by our people at their landing had his ears slit, when we concluded that he had doubtless been formerly under the power of Selkirk. This was, indeed, an animal of a most venerable aspect, dignified with an exceedingly majestic beard, and with many other symptoms of antiquity. During our stay on the island we met with others marked in the same manner, all the males being distinguished by an exuberance of beard, and every other characteristic of extreme age."

On January 31, 1709, Selkirk sighted two vessels, the "Duke" and "Duchess," under the command of Captains Woodes Rogers and Thomas Dover, with Dampier as pilot, on a privateering trip in the South Seas. In the evening Selkirk lighted a fire as a signal, and next day once more beheld the faces of his countrymen.

In Rogers' published account of the circumstances we are told that Selkirk had so far forgotten his language for want of use that there was some difficulty in understanding him. It was some time before he could wear shoes, his feet swelling when he first put them on. The food on board ship, too, did not suit him.

Thus Selkirk abdicated his dominion, where he had been monarch of one of the most delightful islands in the world. He arrived in England, as master of the "Duke," on October 13, 1711. His story was the chief topic of conversation in London, where "it was matter of great curiosity to hear him, as he is a man of good sense, give an account of the different revolutions in his own mind in that solitude" (Steele). According to Wright, the writer of *The Life of Daniel Defoe*, the famous author met Selkirk in a house at Bristol, where he heard the wonderful tale from the hero himself, and whence it was supposed he got the idea of writing *Robinson Crusoe*. Who can estimate the tremendous influence that Defoe and the humble Largo sailor have had on the careers of our young men? May not even the efficiency of our mighty fleet at the present day be due in some small part to these two celebrated men?

Clipperton was the next to visit the island in September, 1719, in the "Success." Harris relates that "the beauty and fertility of the island, compared with the dangers and difficulties they were sure to meet with in the South Seas, tempted four of his crew to enter into a scheme of remaining in possession of so valuable a country. In pursuance of this they actually ran away from the ship, and hid themselves to the mountains. For the first five days they were hard put to it, being forced to subsist wholly on Cabbage trees, of which they found a great quantity, but having, by good fortune, one night found some fire, which had been left by the goat hunters from their own vessel, it served them in good stead, for they were now able to dress their fish and

FIG. 78. *JUANIA AUSTRALIS* (THE CABBAGE PALM) ENEMIC TO THE ISLAND OF JUAN FERNANDEZ.

satisfy their hunger." Two of the men were eventually captured by the goat hunters, who found them more difficult to secure than the goats, and they were fired at several times before they would surrender. The other two men remained a couple of months after Clipperton's departure, when they surrendered themselves to the Spaniards. Captain Shelvocke arrived in the following January, and returned in May, when his ship was wrecked on the island. They were able to land and build a boat out of the wreck, but as was much discontent among the crew, considerable delay occurred before the boat was launched. During the making of the boat a party of the men, eleven in number, decided "that they were not yet prepared for the other world;" and when Shelvocke and his adherents departed, the eleven men remained on the island, together with thirteen black and Indians.

THE ALPINE GARDEN.

ALPINES WITHOUT A ROCK GARDEN

At the present time rock gardens are so much under a cloud that it needs a good deal of mental hardihood to write about them. Their owners seem inclined to regard them with that air of disavowing aloofness that a man assumes when his dog has disgraced himself at the butcher's.

Yet even in normal times it is surprising how many people have a rooted objection to rock gardens, and I have heard many curious reasons given why rock gardens should not be. The perpetrator of a lamentable outbreak of villa, in aggressively good taste, laid it down to me that rock did not occur naturally in the neighbourhood, and that therefore a rock garden would be incongruous. Such reasons as this are of course insincere. All gardening, good and bad, is more or less of a compromise, half nature and half art, and the rock garden is just as legitimate a branch of gardening as the cultivation of the most expensive Orchids or the most hectic Ramblers. Given a fondness for Alpine plants I know of only two good reasons for not having a rock garden: lack of space, and the initial expense. But lack of space is not, after all, a very good reason, for it is possible to have a practical and a perfectly charming rock garden, exactly one foot square, and to grow upon it a surprising number of the loveliest and the best Alpine plants. I have done it. A garden of well-laid rocks and suitable soils is undoubtedly the best possible setting one can have for Alpine plants, but, if these are not available, that is no reason for not growing Alpine plants. The late Canon Ellacombe's rock garden proper was a comparatively small affair, yet he grew Alpine plants successfully, and always charmingly, in almost every part of his garden. They were grown as unconventional edgings to the borders, and one came upon them in all sorts of unexpected, odd corners. An excellent example of rock plants grown without a rock garden is to be seen at Aldenham House. Here, low, simple edgings of small pieces of rock, well sunk in the soil, have been laid as edgings to hand-sown herbaceous borders on either side of a central path in the kitchen garden. These rock edgings are little more than a couple of feet wide, and they are planted with many kinds of showy and low-growing rock plants, Saxifrages, both silver and mossy, Alpine Phloxes, Aubrietias, silvery Achilleas, Alyssums, Rock Roses, Veronicas, Gentians, Arenarias, Thrift, and many others. Rock plants are too seldom used in this way, yet there is endless scope for ingenuity in grouping the plants. The arrangement of the stone should be quite simple: the simpler the better; or one can do without

it altogether. In grouping the plants it is a very good plan to run certain sorts into each other, so that they mix and put up a good fight for existence. A single plant of *Arenaria montana* placed among several plants of *Lithospermum prostratum*, for instance, makes a lovely show of pure white and vivid blue. Dwarf Campanulas, like the varieties of *C. pusilla*, alba, Miss Willmott and pallida, are far prettier if planted in mixed colonies than when carefully shepherded, and the outliers of such a mixed colony might run into and mingle with some of the dwarf-habited Pinks such as *Dianthus caesus* (the Cheddar Pink) and varieties of *D. plumarius*. A splendid mixture which I came across as a self-ranged accident, and duly noted, was a special deep rich purple form of *Campanula unifolia* which I collected at Mr. Coles, growing with the ruby-red *Dianthus deltoides superbus*. To avoid bare spaces in winter, the lighter growing deciduous plants, such as the small Campanulas, may be planted among evergreen tufted plants like Saxifrages, Pinks, and Alpine Phloxes. Spangled patches of rose and lavender or lavender and white may be made by interplanting different varieties of *Phlox subulata*; deep rose and violet with *Phlox reptans* and *Viola gracilis*, and for real barbarism during mixture *Aubrietia Dr. Mules* and *Aubrietias Fire King*, *Royal Purple* and *Magenta Crimson*. The scope for this sort of thing is endless, and experimenting is a great pleasure. Such an edging as that at Aldenham is surely a better foreground to a herbaceous border, and much more interesting, than either Box or a mown turf verge. The effect of a well kept grass edging is certainly pleasing, but from the practical point of view the difficulty is that directly the foremost plants begin to stretch out and enjoy themselves they get mutilated by the mowing machine. The labour of keeping grass verges in good condition is an item that must be taken into consideration.

Then, of course, any old wall can be made a joyous home for Alpine plants. Seeds may be sown, and young plants tucked into crevices. Many good things will grow and thrive without any special attention. *Ranuncula pyrenaica* is a plant which is usually treated with a good deal of respect, and for which special, cool, perpendicular crevices are constructed in the rock garden. But some of the finest and healthiest plants I have seen in cultivation are growing without any fuss at all on a ledge of a mossy terrace wall overlooking a pond. The aspect is north or north-east. It is pleasant to lean over from the terrace and see this thriving, increasing colony, especially in May, when it is covered with large violet, moon-faced flowers.

I have said that it is not necessary to have a rock garden in order to grow Alpine plants. I will go further, and assert that it is not even necessary to have a garden at all to grow them. You can grow them on other people's roadside garden walls. All you need do is to scatter the seeds of Alpine and rock plants in the rotten mortar and crevices on the top of the wall as you pass, though I warn you that someone is almost sure to come along the road just when you are going to throw the seed up. You will then shrink guiltily from the perfectly innocent deed and sow another time. I enjoy several colonies of wall plants in this way, at other people's expense. But, of course, there are failures. I had a lovely Cheddar Pink and several Wallflowers doing splendidly on a certain old lady's garden wall. She discovered them, had them destroyed, and the wall pointed. Fortunately, the man who did the work was a bad workman and used bad mortar. The Cheddar Pink had only been cut off at the neck. Its roots had quested deep among the old bricks, and the stock actually sprouted and pushed aside the ill set pointing mortar, with the result that it is alive and flourishing to this day. *Charles Elliott, Stevenage.*

ON INCREASED FOOD PRODUCTION.

A FEW QUERIES.

SINCE more space has been allotted in the *Gardeners' Chronicle* to vegetable items, many interesting and helpful hints have appeared from different writers, though occasionally a puzzling contribution excites the surprise of the reader. For instance, Mr. Divers, late of Belyof (see page 181), says he planted all Potatoes the same distance apart, and apparently with good results. Mr. Divers' remarks are a great challenge to the experience and practice of gardeners. Either they are deceived, or Mr. Divers could have had still better results by giving robust haulm producers more space than weak growers. Surely the teaching of the majority must be the sounder, otherwise there is no reason why tall and short, or bulky and slim-growing greenstuffs should not be spaced at one distance for the lot, with equal likelihood of success. Another unusual and, I think, questionable practice comes from the pen of another great gardener, Mr. Brotherton. He tells us he has planted Brussels Sprouts between Brussels Sprouts. Perhaps this is only a war-time expediency, but *R. P. B.* should have added such a hint if it were so, and also have said whether the ground thus occupied two years in succession with the same long season vegetable had special preparation before the first crop was planted. Yet another note seemed to me strange; it was on Beetroot (see page 128). The writer stated that this vegetable withstood the severe winter in the South of England though left in the ground. To what county or counties does this apply? I have always followed the teaching that it is best to take up and store Beetroot, and have never tested what degree of cold it could safely bear. One or two of our recognised works on gardening, notably Thompson's *Gardeners' Assistant*, say that Frost is fatal to Beetroot. Perhaps someone who has tested the hardihood of the Beet will tell us his experience, as undoubtedly it would be a boon to those gardeners lacking storage room to be able to leave the roots longer in the ground. *C. Turner, Amphill Park.*

The books, it appears, are not always right. Beetroot at Wisley remained perfectly sound in the open garden during the past severe winter. See *Gardeners' Chronicle*, March 31, 1917, p. 157. *Eds.]*

THE RIGHTS OF ALLOTMENT HOLDERS.

At the beginning of February this year, the Bretham Horticultural Society was authorised by the Borough Surveyor of Ealing, under the Defence of the Realm Regulations (Cultivation of Lands Order), to occupy the grass land (some 1½ acre in extent) at Didden House, Hanger Lane, Ealing, for the purpose of "war" allotments. Thirty-three allotments were pegged out, and cultivation proceeded as rapidly as the weather would permit. Some of the allotments were shared by the holders, and about fifty men in all were working upon them.

Just before Easter, the work of erecting two sheds was put in hand without any notification whatever to the society, for the purpose of test ing smoke-bombs. The attention of the Borough Surveyor was called to the buildings by the Horticultural Society, but as the sheds did not encroach upon the allotment ground, and it was assumed that they were serving some national purpose, it was not considered worth while to press for their removal.

On May 7, however, a notification was received from the Borough Surveyor that the construction of a factory on the allotments was under contemplation. Prompt and vigorous action was necessary if the land was to be retained for food production, and the circumstances were brought to the notice of the Ministry of Munitions, the Board of Agriculture, and the member for Ealing (Mr. H. Nield), who promptly placed questions upon the notice paper of the House of Commons.

As, however, the materials for the factory began to arrive, and no definite action had apparently been taken by any public body to retain the whole of the allotments for food production, the Horticultural Society called a protest meeting of allotment holders on Saturday, the 12th inst. A well-attended meeting, which included representatives of the North Ealing and the Ealing, Hanwell and District Societies, decided to make strong representations to the Board of Agriculture and the Town Council. A tentative proposal was made to the society that eight of the thirty-three allotments should be given up, and the remaining twenty-five fenced off, but the meeting was unanimously of opinion that on grounds of principle this proposal should not be entertained.

After the protest meeting was completed, a notification was received from the Ministry of Munitions that the London District Engineer would visit Didsden House on May 14, and the society asked the Borough Surveyor to attend, and the Board of Agriculture to send a representative. The estate agents acting for the factory proprietor were also present. After the facts had been recited and the position explained, the compromise by which for the present eight of the thirty-three allotments would be taken, coupled with compensation, was definitely refused by the allotment secretary, who represented the society. The stand taken up by the society was reported to the factory proprietor, who arrived at Didsden House just before the meeting broke up, and he decided to abandon the proposal to build upon the allotments and to seek a site elsewhere.

The Brentham Horticultural Society feels that as a matter of public duty the facts of the case ought to be placed on record for the benefit of other allotment holders.

The incident shows the very real danger to which allotment holders are exposed of having their "war" plots confiscated, and it also shows the great advantage of combination amongst allotment holders. Had not the tenants been members of a society which had the organisation for making an immediate and vigorous protest, there is but little doubt that some, if not all, of the plots would have been confiscated, and the food produced in the country would have been correspondingly decreased. *Correspondent.*

HARDINESS OF BROCCOLI.

UNIVERSAL Protecting Broccoli withstood the severe winter better than any other variety I have grown. I planted 4,000 plants of Broccoli in several varieties last year, but not more than 2 per cent. of any other variety survived the severe frost of February, whereas 75 per cent. of Universal Protecting survived, and I am now cutting good heads of this variety. These plants were grown in an exposed situation, where 55° of frost were registered. *W. Anton, Pyrford Court Gardens, near Woking.*

BRUSSELS SPROUTS.

My method of growing Brussels Sprouts is, I think, worthy of consideration by those who are persuaded that the plants occupy the ground too long in comparison with other green crops. My plan is as follows: The plants are put in lines 4 feet apart, with the usual amount of space in the rows. At the same time I plant Cauliflower or Cabbage between each row, these being cut as soon as ready and the stumps pulled up, leaving the Brussels Sprouts ample room for development. I also plant at the same time in lines between the Cauliflowers and Sprouts Cabbage Lettuce, and thus get three crops in continuation. I have proved Brussels Sprouts to be the most profitable crop of all vegetables. There is no reason why the plants should not eventually be lifted and laid in the ground close together in lines where they continue to give plenty of green shoots, and thus permit the ground they have occupied during the winter to be prepared for

the summer crops. *A. J. Elgar, Groggyn Hall Gardens, Newton.*

SUGAR FOR JAM.

A GREAT waste of valuable food in the form of fruit will be inevitable, unless some means of increasing the supply of sugar can be assured. It is not enough to supply the wholesale jam manufacturers with as much sugar as they had last year, which has been arranged, if the hundreds of thousands of housekeepers who usually make jam are almost entirely lacking in sugar. Strawberries will soon be ready, and Currants will follow early in July, with Plums a little later.

The importance of jam as a food for families of poor or comparatively poor people is not sufficiently appreciated. It is used very extensively for children instead of butter, even in years when the butter supply is ample, and will be more necessary than usual while the war lasts. Home-made jam can be produced at half the prices now charged at shops, and is at the same time vastly superior to the stuff consisting largely of Apple, or possibly Turnip, jelly. This is particularly the case in rural districts, where fruit is largely grown, as supplies for jam in those districts can be obtained cheaply. There are considerable quantities of fruit damaged for market, but still sound enough for jam, which pickers get free of charge, while they can obtain undamaged fruit at wholesale prices. To lose this advantage through lack of sugar will be a misfortune of serious character, and the authorities may well be urged to avert this disadvantage if they can possibly do so.

Without a fair supply of sugar it is probable that half the Plum crop will be wasted. *Southern Grower.*

THE GERMINATION OF PARSNIP SEED.

ALWAYS fickle, Parsnip seed appears to be much longer in germinating this year than usual. Seeds that were sown seven weeks ago have not yet shown above ground, though an examination of the seeds proves that the swelling embryo has burst the seed covering, and once this has occurred the seedlings will soon be visible. Considering the length of time Parsnip seed will remain in the ground apparently dormant, growth, once germination commences, is astonishingly rapid, for the seedlings become 3 inches high in a few days. Are the present stocks of Parsnip seed unusually poor, or have the times made one extra critical? For I notice that one advertiser guarantees 60 per cent germination. *A. C. Parrott.*

BUTTER BEANS.

I AM obliged to Mr Bartlett for his remarks on my note which appeared in your journal on May 12.

I believe the variety usually vended under the name of Butter Bean is the Lima, which rarely succeeds in this country, but from my experience many varieties of the Dwarf Beans are equal, if not superior, to the Lima in flavour, notably Magnum Bonum, Green Gem, Canadian Wonder, etc., and by removing the skins after cooking such varieties as Canadian Wonder become more palatable.

We are growing here, this year, for the first time, a small dwarf Bean, brown in colour, introduced from Holland, used extensively by the Dutch, and said to be a very easily-grown farinaceous food. The great point is to sow as early as possible in a sunny position, so that the seed may become thoroughly ripened before late autumn.

The Butter Bean, or Golden Waxpod, which is sold and grown by some in this country for producing a green food, should not be mistaken for the article of commerce generally known as the Butter Bean, the latter being a different variety entirely, with very much larger seed. *E. Beckitt, Altham House Gardens, Elstree.*

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor.

BRUSSELS SPROUTS.—The earliest plants of Brussels Sprouts are ready to plant permanently in ground that was dug and manured in winter. Loosen the surface soil carefully with a hoe to destroy small weeds. Exercise great care in lifting the plants from the nursery bed to retain a good quantity of soil on the roots. Water the plants before they are lifted, and again as soon as they are replanted. Make the rows 5 feet apart, and put the plants 2½ feet asunder in the rows. In dry weather give the roots plenty of soft water. Make successional plantings as soon as the seedlings are large enough for transplanting. This vegetable stands the winter well, and produces a supply of Greens over a long period.

SEAKALE.—Plantations of Seakale recently made require attention. Remove the worthless shoots as they appear through the surface, reduce the growths to one on each plant, and hoe the surface soil carefully. A dusting of soot along the rows previous to hoeing is beneficial to growth.

GLOBE ARTICHOKE.—There is still time to make plantations of Globe Artichokes. The old plants suffered seriously last winter, and new plantations will be necessary in many places. Low-lying, elegant ground is most suitable for the plants; they perish in such conditions. Allow a space of 4 feet between the plants each way. Mulch the ground with long manure to retain the moisture. Cauliflowers or French Beans may be planted between the rows for the first season.

CAULIFLOWERS. Cauliflower plants which were put out a month ago should be given liberal supplies of liquid manure from the farmyard. Hoe the ground deeply between the rows, and give the roots water whenever the plants need moisture. Make further plantations of spring-sown Cauliflowers to maintain an unbroken supply, and see that sufficient moisture is given to promote free growth. Half-grown Giant Cauliflower may yet be sown for late October supplies.

SPINACH. Make frequent sowings of Spinach in a position not fully exposed to the sun. Use the hoe freely amongst the plants during dry weather, and water them during the evening when moisture is necessary. New Zealand Spinach should be sown at once if not already done with a view to producing a supply when other varieties fail through dry weather. Winter Spinach should be removed from the ground before it runs to seed, and the land prepared for some other crop, such as late Carrots, choosing a stump-rooted variety.

PEAS.—Early-sown Peas should be staked. All Peas which are through the surface should receive a good mulching of farmyard manure. Main crop varieties may be sown in well-prepared trenches; some of the late sorts may also be sown now for autumn supplies, and the last sowing of Autocrat made about June 10. Mulching the ground between rows of Peas before the soil becomes very dry will repay for the trouble and expense.

FRENCH BEANS.—The Dwarf Bean may be sown in quantity now. Sow the seeds thinly in rich soil, and allow plenty of space between the rows in order to produce stocky plants which will give plenty of pods. The Belfast and Canadian Wonder are well suited for sowing now. Beans in pots should be well ventilated. The lights may be removed entirely during hot days.

MUSTARD AND CRESS AND RADISHES.—These salads may be sown weekly on a border shaded by a north wall. Radishes should be given plenty of moisture to favour a quick growth.

THE FLOWER GARDEN

By W. J. GUSE, Gardener to Mrs. DEMSTER, K. Hall, Staffordshire.

CAMPANULA.—In order to keep up the stocks, seeds of *Campanula Medium* (Canterbury Bell), *C. pyramidalis*, *C. persicifolia*, and a few others may be sown now in frames in light, rich soil, which should be kept moist. Apply a light shading until the seeds have germinated. Transplant the seedlings in the open directly they can be handled.

BORDER CHRYSANTHEMUMS.—Young plants of border chrysanthemums raised from cuttings rooted this spring should be placed in their flowering quarters forthwith. If the ground has been well prepared beforehand, little more will be required beyond raking at lightly to level the surface. Allow a space of 18 inches to 2 feet between the plants, according to the variety. Place a stake to each plant to the shoots, as they grow, and stop them once or twice to cause growth to be bushy, although this is not necessary with some of the older varieties. The old stools may be divided and replanted at a space of 3 feet apart.

SUMMER BEDDING PLANTS.—Those who are doing a certain amount of bedding this year may be reminded that all bedding plants should be finally hardened, taking care that they do not receive a sudden check from exposure to cold winds. Watering must be done carefully; examine each plant and, if moisture is necessary, use tepid water. The more hardy plants may be placed both with in their summer quarters, commencing with *Azalea*, *Prunus Californica*, *Fuchsia*, *Verbena*, *Portulaca*, *Geranium* (Golden Feather), *Ageratum*, and *Pantheoneum*. These may be followed by *Zinnia*, *Polka Dots*, *Impatiens*, and similar plants. Staked-out pots, sub-tropical plants, and others that are very tender should not be placed in their bedding quarters before June. The planting of the mixed borders, so often destroyed until the general bedding scheme is finished, will be found that the borders receive only the most treatments that are left over. Directly the flower beds are vacant a moderate amount of decayed manure should be dug into the soil, but not an excessive amount, or the plants will make a stony growth and produce but few flowers.

SEED SOWING.—Seeds of most perennials may be sown now in rich soil in cold frames. Prick out the seedlings as they are fit to handle. Another sowing of hardy annuals may be made to furnish plants for late flowering. Thin the plants at an early stage of growth.

FRUITS UNDER GLASS.

By J. D. GOSKIN, Gardener, The Victoria Rooms, 11, Cannon Street, London, E.C.

AUTUMN STRAWBERRIES IN POTS. Plants from which an early crop has been gathered will often give a very satisfactory second crop in September and early October. My plan is to stand the plants, not crowded together, in a little shade for a time, and give the roots only sufficient water to keep the foliage healthy. At the end of June the old useless foliage and runners are removed. At the same time one of the surface soil is taken away, and, after seeing that the drainage is satisfactory, a top dressing of fresh material applied. The plants are then treated as are newly planted ones. I have found as a rule, that 75 per cent. of the plants will respond to this treatment and fruit again in the autumn. The best varieties for second fruiting in one season are Royal Sovereign, George V., and the old well tried variety *Vicomtesse de Thury*.

MELONS.—The earliest Melon fruits, even in plants that have not been tied hard, will soon be showing signs of ripening. When that stage is reached a slightly less amount of water should be given, and manure stimulants withheld entirely. Let all the sunshine possible reach the fruits, and remove any unnecessary foliage. Do not keep the atmosphere too dry, as this would favour the spread of red spider. Melon nets should be used for the fruit, in preference to any other means of support. I have used both

raffia and boards, but have cast these aside in favour of the nets, for they both retain a little moisture, whereas in the case of the nets this is not so. Later plants should be given every encouragement to develop. Where the fruits are swelling, freely pinch the young growths frequently. Do not attempt to overburden the plants with an excess of fruit beyond what can be reasonably expected to ripen perfectly. Plants in flower, or nearing that stage, should be kept growing freely. Do not give an excess of water at the time the fruits are setting. Now is a suitable time for sowing seeds for what may be considered the latest crop that can be grown in normal conditions, that is, with but little help from fermenting material or artificial warmth. The fruits will ripen during September and be found extremely useful for dessert. Reliable varieties should be selected for this crop, well proven by the grower, for it is not a time for experimenting with novelties.

THE ORCHID HOUSES.

By F. F. WATSON, Gardener to Sir J. HAMILTON GOMY, Belmont Park, Belfast.

DENDROBIUM PHALAENOPSIS CHRODIERIANUM.—Young plants are developing on plants of *Dendrobium Phalaenopsis Chrodierianum*, and as soon as they appear at their bases fresh cutting material should be divided. The plants grow equally well suspended from the roof rafters or placed on stages, provided they are exposed to the sunlight. If suspended the plants should be grown in shallow pans, but pots are preferable to those grown on the stages. It is not advisable to repot plants which were potted last season in the compost, as still good, but some of the old material and replace it by fresh material. The receptacles should be the same size that will accommodate the roots, for old and young roots plenty of water they receive, but when the potting material dries out, the old roots, by retaining half the receptacle with their cork top drainage, and let the young roots be left with the time. Pack the compost firmly about the base of the plants, making them secure by tying the pseudo-bulbs to the stage. Those in pots may be secured to the receptacle. A suitable potting medium consists of three parts *Orchid* fibre and 1 of *Chlo*, with 1 part *Sphagnum* moss, the whole of the material being cut into short pieces. When the plants are grown freely in the compost they should be kept liberal supplies of water. The plants may be kept healthy and moisture in summer, and should be sprayed overhead at least twice a week, and during the sun's rays for three or four hours during the middle of the day. *Dendrobium bigibbum* and *D. superbum*, closely allied species, require similar treatment.

THE HARDY FRUIT GARDEN.

By W. A. WATSON, Gardener to His Honour DEVEREAUX, Esq., W. W. Castle, Dublin, Ireland.

WALL TREES. Fruit trees on walls should be inspected carefully at regular intervals. The young shoots will indicate by their degrees of elongation that portions of the tree most of the sap is flowing. Early attention is very necessary in the case of trees trained vertically, for if some of the gross shoots are not checked they will soon monopolise an undue share of the tree's energies. An equally vigorous growth should be encouraged all over the tree by stopping the stronger growths at about 6 inches, and if required, be training in two shoots instead of one. All unnecessary shoots should be removed as early as possible in order that the weaker ones may be strengthened. As a rule, horizontally trained trees do not grow unevenly, but sometimes the upper branches take a pronounced lead, and such shoots should be stopped at an early stage. Make secure the new shoots by tying or nailing early to prevent damage by winds and storms. Where the old spurs have been cut back on Plum and Pear trees, and the shoots are growing well, thin the latter to the required number and stop the remainder at the third or fourth leaf. Such treatment will result in spurs forming quite close to the main branches, and will possibly pro-

vide fruiting wood for another season. There is nothing to be gained by leaving numbers of strong growths on any tree, even if there be no fruit, as excessively vigorous wood is seldom productive. By constant stopping of the shoots fruit-buds form and the tree becomes fruitful.

WATERING NEWLY PLANTED TREES.—Rain has fallen freely in many parts of the country, but in some parts the ground may still be dry, and the newly planted fruit trees need watering. If a mulch of short manure is spread over the roots it will help to check evaporation and conserve the soil moisture.

STRAWBERRIES. Place litter along the rows of early Strawberries. Straw is scarce, and only sufficient to keep the fruit clean should be used. Thin the flower scapes as soon as it can be seen that the berries have set. Strawberries on borders should be sprayed with clear water, as this favours free setting of the fruits, for the roots need to be well supplied with moisture at that stage. A good soaking with manure water from the sewage tank will materially assist the plants, and especially the early varieties, on which the berries are swelling.

PLANTS UNDER GLASS.

By F. F. WATSON, Gardener to Lady NORTHGOTE, Eastwell Park, Kent.

THE CONSERVATORY AND FLOWERING HOUSE. Very little fire heat is needed in the conservatory and plant house at this season. Plants in bloom always last much longer in good condition in a house having a cool, dry, and atmospheric, stagnant humidity quickly setting up decay. A little ventilation should be permitted at night to allow superfluous moisture to escape, and the blinds should be lowered fairly early in the morning before the sun has much power. In dull, damp weather, after the daily watering, all water should be mopped up, and the house dried as soon as possible.

THE PALM HOUSE.—Where a collection of Palms is grown in a special house a heavy, permanent shading is best for the plants, and obscures the daily labour of lowering and pulling up blinds. Palms thrive in dense shade, and keep their colour much better than when exposed to the sunshine, especially under faulty glass. If growing in a mixed collection of plants, arrangements must be made for shading the Palms, otherwise the leaves will almost certainly receive injury. The Palm house should be kept fairly hot and damp; excessive ventilation is unnecessary. Close the house early in the afternoon and syringe the plants and house heavily. The temperature may be allowed to fall considerably at night without incurring any risk to ordinary Palms, such as *Kentias*.

BEGONIAS FOR HANGING BASKETS. The newer varieties of tuberous Begonias of pendulous habit are fine acquisitions for growing in baskets. The dormant tubers, having been started in boxes, should be transferred at a suitable stage direct to the baskets instead of to pots. Line the baskets with moss, and over the moss arrange some of the rougher portions of the compost. Select plants of similar strength and size for each basket to ensure evenness of growth. *Marie Bouchet* and *Fleur de Chrysanthemum* are two excellent varieties for large baskets. *Golden Shower*, *Lola*, *Mrs. Bilkley*, *Corallina* and *Ruby* are newer sorts of great merit.

RICHARDIA AFRICANA.—As plants of the white *Richardia* pass their best condition remove them from the greenhouse and place them in a cold frame, or, failing this, in the open on a bed of earth. Gradually reduce the amount of water at the roots, and after the foliage has died down place the pots on their side or put them in a glasshouse where they can be rested by withholding water. This treatment is recommended for plants that are required to flower early in the winter. Planting them out in shallow trenches in the reserve garden is equally successful for the later batches. In this case the old foliage dies off, and eventually new growth starts away very strongly. The plants should be carefully lifted in September and potted.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication.—as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich 56.5°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, May 24, 10 a.m.: Bar. 29.5; temp. 63.5°. Weather—Cloudy.

**Twenty-five Years
with the
"Gardeners'
Chronicle."**

With the beginning of the present month Mr. R. Hooper Pearson, managing Editor of this journal, completed twenty-five years' service with the *Gardeners' Chronicle*. His many friends, both upon the staff and also among our readers, will congratulate him on having for so long a period rendered great service both to this journal and to horticulture in general. At the time when Mr. Pearson joined the editorial staff the late Dr. Masters had already been Editor for a quarter of a century, having succeeded Dr. Lindley, the first Editor, in 1865. For fifteen years Mr. Pearson assisted Dr. Masters, the relations between the two being of the closest description, the result being that as his chief grew old a larger share of responsibility naturally fell on Mr. Pearson's shoulders. But, as he is always eager to state, he owed no little of his capacity to undertake this responsibility to the admirable training which he had received at the hands of his chief. Masters possessed a knowledge of horticulture that was unique, and his unvarying courtesy, not ruffled even by the *contemptus* which arise inevitably even in the best-regulated office, served as an admirable model to his staff, and so long as he lived everybody connected with the paper realised that it is possible to be strenuous without being ill-tempered. The grace of urbanity descended from Dr. Masters to Mr. Pearson, and during the many years which the present writer has

enjoyed his friendship he can remember no occasion when Mr. Pearson found it necessary to lose his temper in order to gain his end.

Of the staff of the *Gardeners' Chronicle* as it existed when he joined the paper only Mr. Pearson is left. During that period of twenty-five years six members of the staff has passed away—one of whom has given his life for his country in the present war. Of the proprietors who, when Mr. Pearson first came to Wellington Street, were actively interested in the *Gardeners' Chronicle*, Mr. W. H. Bradbury died in 1892, and Sir Charles Dilke, chairman of the Board, died in 1911, but Lord Lindley, though prevented by increasing age from taking a part in the direction of the journal, still shows, whenever matters of importance are under discussion, the great interest which he takes in the journal of which his father was so distinguished an Editor.

During his long association with the *Chronicle* Mr. Pearson has seen many changes in the mode of production of newspapers and journals. When he began work on the staff the pages were printed by movable "compositors'" type, which had to be cleaned after printing and was used again week after week. The great disadvantage of this form of type is that it deteriorates with use owing to the "face" becoming battered, and hence an editor has to watch the pages week by week in order that the printers, when the impression begins to be blurred, shall be required to discontinue the use of the type, and send it to the foundry to be recast. The advent of the linotype machine did away with the need for the continuous use of the same type. With this process the metal is melted every week, and each issue is printed with freshly-made type. But like the old method which it superseded, the linotype has its defects. Thus, since the letters in a line of type are all joined together in a solid piece, if a meticulous editor inserts but a comma by way of correction in his proof the whole line has to be thrown out and recast, whilst if the alteration consists in the insertion of a word several lines may have to be sacrificed in order to gain the space necessary to let it in. Herein lies the opportunity for the compositor to make a new mistake in the course of setting an old one right, and this new mistake cannot be discovered till the paper is printed, when the error is detected no less quickly by readers than by editors. Fortunately, however, the linotype operators are so skilled that mishaps due to this cause but rarely occur.

As printing has changed, so has the method of illustrating journals. In 1892 wood-engraving was used almost exclusively, and anyone who turns to the pages of the *Gardeners' Chronicle* of that period will find examples of the admirable work of Mr. Worthington G. Smith, whose contributions to those pages extend over a period of forty years, and whose hand still retains its cunning. Wood engraving

has given place, for better or for worse, to the process block, and drawings have been largely superseded by photographs, whilst the advance in colour photography made it possible in 1909 to introduce illustrations in natural colours into the pages of the *Gardeners' Chronicle*.

In illustration of the variety of work which falls to editors and their staffs, Mr. Pearson is wont to recall with a certain amusement the part which was played by Dr. Masters and himself at the period when opinion was divided upon the alternatives which then appeared to confront the Royal Horticultural Society, of either building a Hall or securing a new garden in the place of Chiswick. The *Chronicle* was a warm advocate of the view that priority should be given to the Hall, and Mr. Pearson's rôle was to visit each site proposed by the champions of the garden idea, to discover why that particular site would never do for the purpose for which it was recommended, and to descant on its shortcomings in these pages. The curious will find in the issues of that time reason both to applaud the ingenuity with which the work was done and to appreciate the efforts put forward on behalf of the "Hall," which, when it was built, everyone recognised was essential to the prosperity of the Society.

After Dr. Masters' death in 1907 Professor Brethland Farmer became Editor of the *Gardeners' Chronicle*, and Mr. Pearson, by reason of his long experience, was able to smooth the path which besets the "commencing" editor. The call of other duties prevented Professor Farmer from remaining with the *Chronicle* for very long. His successor recognised, as Professor Farmer had done, the invaluable services which Mr. Pearson had rendered to the journal for so many years, and felt the burden of his duties lightened when his colleague consented to accept the title of Managing Editor, a part which, for all practical purposes, he had filled already for many years.

So in sign of friendship to the most loyal and clear-headed of men this brief record is written. May the service which Mr. Hooper Pearson renders to horticulture and to the *Gardeners' Chronicle* long endure.

RUST-RESISTANT ASPARAGUS.—A variety of *Asparagus* has been produced by the joint work of the U.S. Department of Agriculture and the Massachusetts Experiment Station, which is said to be resistant to rust. Seed of the new variety is being distributed by the U.S. Department of Agriculture.

WATERING ALLOTMENTS.—An announcement in the *American Florist* holds out as an encouragement to inhabitants of Tacoma, Washington, to grow more food or cultivate vacant plots that the City Commissioners "will make no charge for sprinkling."

THE FAIRCHILD LECTURE.—The Thomas Fairchild Lecture will be delivered at Shore ditch Parish Church by the Rev. W. H. THOMPSON, vicar of St. Stephen's, Eading, and Gresham Lecturer, on Wednesday, the 30th inst., at 6 p.m. The Worshipful Company of Gardeners will attend in state.

SOCIETIES.

ROYAL HORTICULTURAL.

MAY 22.—The fortnightly meeting of the Royal Horticultural Society on Tuesday last, in the Drill Hall, Buckingham Gate, was as successful as the previous one. The hall presented a very gay appearance, filled with a variety of spring flowers, in which Tulips predominated; the weather was warm and summerlike, and large numbers of visitors were present. Tulips are much later this year than usual, and this fact seems to have effected an improvement in the quality—probably in great measure because they have missed much of the inclement weather which usually causes a good deal of surface injury to the blooms.

The National Tulip Society's annual exhibition was timed to take place in conjunction with the R.H.S. meeting; but, as in the case of all the special floral societies in present circumstances, the response was much below that of normal times. The Florist's Tulip is a very specialised flower, and is only cultivated by enthusiasts, whose activities serve to perpetuate the efforts of the old raisers. Messrs. BARR AND SONS included several of the more notable sorts in their exhibit of cottage and May flowering varieties.

Several novelties were submitted to the Floral Committee for award, but only one received recognition, namely, *Eryochorda macrantha*, a hybrid raised by Messrs. V. LEMONNE AND SONS, of Nancy. The members of the Committee were much interested in a beautiful new *Primula*, raised from seed collected by Mr. R. Farrer in China. The plant was sent from the Society's gardens at Wisley. It is a very vigorous grower, producing a large tuft of dwarf, dark-green, palmate leaves and long scapes of deep-mauve or purple flowers. Another interesting plant from Wisley was *Meconopsis quinquefida*, with a solitary, drooping, dull purple flower (see fig. 79). It was put up for award, but as there was only one flower on the plant the Committee preferred to see the species again. Several good groups of Roses were exhibited, in which pillar varieties were given special prominence. Tall, weeping standards of White Dorothy in Messrs. FRANK CANN AND CO.'S exhibit were very ornamental. Messrs. R. R. CANN AND SONS showed arching sprays of the beautiful Fortune's Yellow variety, and also staged two large, showy single varieties, one of which was Silver Moon (white, with a prominent golden centre). Mr. ELSYB HICKS exhibited a good selection of Roses, including many of his own novelties. Roses were also shown by Messrs. W. PATE AND SON, including Scarlet Rambler. Messrs. PETERS' box group of pear trees and climbers was very imposing. As a centre piece they showed a fine, old, ragged *Wistaria* of the white variety, in a Japanese porcelain pot. The Clematis in this collection were also unusually fine, and another striking feature was the various coloured Asters in their new spring growth. Messrs. J. CHRY AND SONS exhibited sprays of flowering trees and shrubs, in which forms of *Pyrus Malus* and varieties of *Malus* predominated. Branches of *Eryochorda Albertii* were interesting, as this species formed one of the parents of the variety which received an Award of Merit. The species has broader petals and a darker eye than the variety, with stamens in groups of five. Carnations were shown extensively, among others by Messrs. ARMYEN EGOS, and Messrs. SIBBELL LOW AND CO. The latter firm had also fine *Aconites* and other greenhouse flowering plants. Messrs. JAS. CARRIE AND CO.'S strain of *Streptocarpus* was much admired, the flowers being of large size and the colours varied. Messrs. H. B. MAY AND SONS' usual exhibit of Ferns was noticed, besides which they showed *Hippocrepis* and *Veronica*. The YOKOHAMA NURSERY CO. showed fascinating little model gardens in small porcelain pans, in which were introduced all the typical features of the Japanese gardener's craft, with haidee, summer house, and stream complete. Messrs. W. CARRIS AND SONS showed forced shrubs and hardy flowers. The selection of Tulips shown by Mr. CANN'S FIRM comprised all the best and newest varieties, including Reanmur (the variety which gained an Award

extent, but the two above-named were the principal species in cultivation. The tall *Latanias* were more in demand than the shorter ones. In order to develop the plants as quickly as possible the houses were heavily syringed about three p.m., shut up close, and the blinds pulled up, even in the height of summer. The result was an intense, moist heat, which in no way injured the foliage of the Palms. Growth with this treatment was rapid, and the plants were suitably hardened before they were sold. *Hippocrepis* and *Gloxinias* may be subjected to similar treatment, though the frames in which they are grown should not be shut up so soon as the more lofty Palm houses. They may, however, be closed in time to receive a reasonable amount of direct sunshine. W. T.

RHUBARB LEAVES AS SPINACH (see p. 195).—Professor Church, in his admirable book *Food*, gives, on p. 153, the following analysis of Rhubarb stalks which had been grown in the open air.

	In 100 parts.	In 1 lb. oz. 21b.
Water	95.1	15.94
Albuminoids, etc.	0.9	0.63
Sugar, glucose and gum	2.1	0.147
Oxalic acid	0.5	0.21
Cellulose	1.1	0.77
Mineral matter	0.5	0.35

He states: "Its sour taste is due to oxalic acid, rather than to the acid oxalate of potash; oxalate of lime is also present. There are some conditions of the human body, the oxalic acid diathesis in which it is probably wiser to avoid eating Rhubarb and other plants, as Sorrel, in which oxalic compounds predominate. As 1 lb. of Rhubarb contains less than 1 ounce of solid matter, and even of this solid matter more than one-quarter is not nutritive, it is obvious that the food value of this vegetable is very small." No mention is made of the leaves, but they probably contain more poison than the stalks. As further cases of poisoning are reported, too much prominence cannot be given to the above warning of Professor Church. I am informed that cooking Rhubarb in bell-metal vessels causes them to brighten inside, thus showing the presence of oxalic or some other acid, and pointing to another source of danger from the metal dissolved. It is therefore safest to cook Rhubarb in earthenware vessels only. W. H. DODDS.

POMPON OR POMPONE?—The small double *Fuchsia*, hitherto properly called Pompon, is printed in all the National Fuchsia Society's publications "Pompone." Why this extraordinary innovation—and upon what authority?—Also "Callarott" instead of Callerott still prevails, a mongrel English word instead of a proper French one. W. H. P.

PROPAGATING VIOLETS (see p. 206).—The finest double Violets I have ever seen were those grown by Mr. Bandle, gardener at Tredeley, North Cornwall, and he was consistently successful. His method of propagation, which by the way, was also practised by most of the other Violet exhibitors in the West of England, was to take unrooted cuttings early in April. These were inserted in boxes of suitable soil, planted out in the open in due course, and placed in the frames in September. I cannot follow Mr. Jenkins' announcement that the spring cuttings are from an exhausted stock, for surely these fresh runners are Nature's method of rejuvenation, and are certainly much more robust than those produced in the autumn. The runners which have flowered may possibly have become exhausted, but being grown in the cool, dry conditions essential for success with frame Violets, grow freely in April, and show no signs of exhaustion. T. C. BARTHOLOMEW.

PEACHES AND NECTARINES.—Last year I recorded an almost total failure of the Peach and Nectarine crops here, owing to imperfect setting of the flowers in late houses, and, for some unexplained reason, poor crops were almost general throughout the British Isles. This naturally made one anxious this season, but I am glad to record that the blossoms on our trees in early, mid-season, and late houses, as well as on trees outside, have set remarkably well and promise fine crops. E. BECKETT.

NATIONAL CARNATION AND PIVOTEE SOCIETY.—Mr. J. J. KEEN, of 54, The Avenue, Southampton, has been appointed secretary and treasurer of this Society, in the place of Mr. CHAS. HENWOOD.

VEGETABLE-GROWING IN FRANCE.—We learn from the *Revue Horticole* that the French Minister of Agriculture has entrusted to the Société Nationale d'Horticulture de France the task of distributing seeds of various market garden crops among growers in the principal agricultural departments, with a view to increasing the cultivation of the most useful vegetables. M. VISCÉY, Director of Agricultural Services of the Seine, has been appointed to organise, with the assistance of the Market Growers' Syndicate of the Parisian Region, the production of a large number of plants of Cabbages and Leeks, which will be sold to anyone making application to the Ministry of Agriculture at a special market in the Halles de Paris. M. VISCÉY, at a recent meeting of the Société Nationale d'Horticulture de France, gave particulars of the present shortage of food, due chiefly to the failure of cereals. In order to meet this deficit, it is necessary to replace the cereals by Potatoes, Beans, Carrots, and other vegetables.

POULTRY AND FOOD.—A booklet has been issued by the Board of Agriculture drawing attention to the inadvisability of feeding poultry on food for human consumption. It is stated that now there is a shortage of Wheat, Barley, Rice, Maize, and other cereals, they should not be fed to poultry, as the results in eggs and meat do not warrant the utilisation, in present circumstances, of food grains. If, on the contrary, the birds, on a few scraps, waste, tail combs, or other materials not fit for human food, the result is to increase the food supply.

WAR ITEMS.—We learn with regret of the following casualties: Lieut. BERTRAM WATSON, killed in action on April 12 last. Before the war Mr. WATSON was engaged in gardening and fruit growing at Sedgemoor, near Evesham.

Sergt. JOHN W. PARSON, Oldswinford, near Stourbridge, employed before the war as gardener to Major G. H. GREEN, killed in action.

By drawing on May 4 in the Mediterranean, Mr. LEONARD CRAWSHAW, son of Mr. DR. RICHIE CRAWSHAW, Rosedale, Scarborough. Mr. CRAWSHAW had been selected as one of a batch of men to be transferred to active service in Egypt, where he was to take up a commission. He had studied the scientific side of plant life, and on several occasions brought interesting subjects before the Scientific Committee of the Royal Horticultural Society.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE VALUE OF SUN HEAT.—The remarks of R. P. B. on this subject on p. 209 are, considering the dearth of fuel and shortage of labour, particularly well timed. The value of economising fuel by making the most of the heat of the sun was brought forcibly home to me between forty and fifty years ago. At that time I was engaged in the nursery of Mr. Herbst at Richmond. He was the first to take up the culture of Palms for the supply of Covent Garden Market, and, having spent some years in Brazil, he was particularly well qualified to do so. At that time Kentias and *Cocos Weddelliana* were comparatively unknown to the general public. The most popular Palm of those days was *Latania borbonica*, now known as *Livistona chinensis*, though the older name is still in general use. The nearest approach to the Kentias of to-day was *Areca lutescens*, which, like most Palms, has also changed its name. It is now known as *Chrysalidocarpus lutescens*. Many others were grown to a greater or lesser

of Merit at the last Chelsea Show), Congo and Belle de Nancy. Hardy plants were well shown by Mr. G. W. MILLER, Mr. G. REUTHE, and Messrs. R. TUCKER AND SONS. Sweet Peas were exhibited by Mr. RONERT BOLTON, who showed some lovely bunches, including several new varieties. One of these was Orange King; another, a bluish variety—Valentine—was an improved Mrs. Hardcastle Sykes; and the lavender-coloured Victory gained an Award of Merit at the National Sweet Pea Society's trials in 1915. Mr. J. DOUGLAS showed a fine exhibit of Auriculas. Mr. CLARENCE ELLIOTT showed Alpines in pots, including some fine examples of Androsace Chamlyi. Messrs. WHITELEGG AND Co. exhibited their own strain of Schizanthus, and Messrs. R. TUCKER AND SONS, besides a number of Alpines, showed a tiny Juniper, *J. communis compressa*. Messrs. BAKER'S, Codsall, also showed Alpines, including the pretty rosy Saxifrage, Codsall Gem.

FIG. 79.—*MECONOPSIS QUINQUEFIDELIS*, PHOTOGRAPHED BY MR. E. FARRER IN ITS NATIVE HABITAT. (See p. 215.)

Floral Committee.

Present: Messrs. H. B. MAY (chairman), W. P. THOMSON, T. STEVENSON, G. PAUL, J. W. MOORMAN, J. DICKSON, C. DIXON, J. W. BAILEY, R. FLOOPER PEARSON, C. E. PEARSON, W. CUTHBERTSON, J. W. BLAKEY, J. F. McLEOD, J. BEAL, E. F. HAZELTON, G. HARROW, W. J. BEAN, G. BENTHE, S. MORRIS, J. HUDSON, CLARENCE ELLIOTT, E. H. JENKINS, and R. C. NOTCUTT.

AWARD OF MERIT.

Exochorda uncinata, a hybrid raised by M. Lemoine, of Nancy, from *Exochorda Albertii* crossed with *E. grandiflora*. The inflorescence is a short raceme of snowy white flowers, the blooms being about 1 inch in diameter. The plant is exceedingly floriferous, and a very ornamental shrub, flowering in April and May. Shown by Messrs. PAUL AND SONS, Chesham.

GRAPES

The following medals were awarded for red sections.

Silver-gilt Banksian Medals to Messrs. B. R. CANT AND SONS, Colchester, for Roscs, and

Messrs. PIPERS, Bayswater, for shrubs and chubers. *Silver Flora Medals* to Messrs. F. CANT AND Co., Colchester, for Roscs; Messrs. J. CHEAL AND SONS, Crawley, for flowering trees and shrubs; Mr. E. J. THICKS, Twyford, for Roscs; Messrs. STUART LOW AND Co., Enfield, for Carnations and Acaecias; and Mr. G. W. MILLER, Wisbech, for hardy plants.

Silver Banksian Medals to Messrs. J. CARTER AND Co., Raynes Park, for Streptocarpus; Messrs. H. B. MAY AND SONS, Edmonton, for Ferns and indoor-flowering plants; Messrs. W. PAUL AND SONS, Waltham Highgate, for forced shrubs and Alpines. *Bronze Banksian Medals* to Messrs. ALWOOD BROS., Weybridge, for Perpetual-flowering Carnations; and Messrs. W. CUPHER AND SON, Highgate, for forced shrubs and Alpines. *Bronze Banksian Medals* to Messrs. BAKERS, Ltd., Codsall, for hardy plants; Mr. R. BOLTON, Halstead, for Sweet Peas; Mr. J. DOUGLAS, Great Bookham, for Auriculas; THE YOKOHAMA NURSERY Co., Clayton House, Kingsway, London, for model Japanese gardens; and Messrs. R. TUCKER AND SONS, Oxford, for Alpines.

Orchid Committee.

Present: Sir Jeneimah Colman, Bart. (in the chair), Sir Harry J. Veitch, and Messrs. Jas. O'Brien (hon. secretary), W. Bolton, Arthur Day, R. G. Thwaites, Gurney Wilson, B. A. Rolfe, Frederick J. Hambury, Paulina Balli, E. R. Ashton, T. Armstrong, Stuart Low, J. J. Cypher, H. G. Alexander, J. E. Shill, A. McBean, J. Charlesworth, W. Colb, G. J. Lucas, S. W. Flary and R. Brooman White.

AWARD OF MERIT.

Odontodia General Hong (*Odm. Aglaon* × *Oda. Faghtskera*), from Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells. A beautiful new hybrid of large size and fine shape. The ground colour of the sepals and petals is creamy white, with numerous large and well-displayed, irregular red blotches, the margins being tinted with a shade of violet colour. The lip is blue colour in front with red blotches around the yellow crest, and the midlobe and margins on the reverse side of the flower are purple. The spike bore sixteen flowers.

PRELIMINARY COMMENDATION.

Odontoglossum Fabia splendens (*Aglaon* × *crumena*), from Messrs. ARMSTRONG AND BROWN. A fine representative of this famous strain. The plant, flowering for the first time, bore a large, broad-petalled flower of dark claret purple colour with a thin white margin and a small elongated white blotch on the tips of the petals.

GENERAL EXHIBITS.

Sir JENEIMAH COLMAN, Bart., Gattou Park, Surrey (gr. Mr. C. Cyber), staged a selection of fine scarlet *Odontodia*s splendidly grown and profusely flowered, the best being *Oda. Lady Colman*, scarlet *Oda. Bradshawian American Triumph*, of fine shape and bright orange-scarlet colour; *Oda. Bradshawian Fine King*, with a branched spike of very brightly coloured flowers; and the new *Oda. Ada* (*Oda. Bradshawian* × *Odm. Thompsonianum*), reddish claret colour, with prominent yellow crest.

G. W. BIRD, Esq., The Manor House, West Wickham, Kent (gr. Mr. H. Redden), showed a fine plant of *Odontodia. Gladys van Familie Rose* (*Odm. Pescatorei* × *Oda. Bradshawian*), with handsomely marked flowers. The original form received the R.H.S. Award of Merit on March 23, 1916.

MESSRS. CHARLESWORTH AND Co., Haywards Heath, were awarded a Silver-gilt Flora Medal for a fine group, one end of which was made up of the various forms of seedling *Miltonias* raised by the firm, varieties of *M. Charlesworthii*, *M. Bismam*, *M. Venus* and *M. vexillaria* Lyoth being conspicuously good. The rest of the group was of good *Odontoglossums*, *Odontodias*, *Laelio-Cattleyas* and others. Novelties flowering for the first time were *Odontoglossum Trentino* (*Harrayan-crispum* × *Alexanderi*), white, heavily blotched with deep purple; *Odm. Isonzo* (*filustrissimum* × *crispum*), rich claret-purple, with white margin and tips to the segments; *Odm. Gorizia* (*Jasper* × *President Polivare*), a finely marked flower; *Odm. Hybla* (*eximium* × *perculum*), dark reddish-purple with white margins; and *Odontodia Hiawatha* (*Charlesworthii* × *Coronation*), purplish-rose, with a yellow crest.

MESSRS. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells, were awarded a Silver Flora Medal for an excellent group in which a plant of *Coelogyne pandurata*, with a spike of thirteen flowers, white *Cattleyas*, and good *Laelio-Cattleyas*, showed well. Novelties included *Brasso-Cattleya Digbyano Mossiae* splendens, of a rich rosy mauve colour, and the darkest of the cross yet shown; *Odontodia Henri* Orchidhurst variety (*Odm. haavengtense* × *Cochlioda Noezliana*), bright orange-scarlet, with yellow crest; *Odontoglossum Fabia splendens* (see Awards); *Odm. Bullecoot* (*Wilkeanum* × *Mars*), a large, handsome flower, red, on a gold-coloured ground with white margin, the petals being finely fringed; *Odm. Aeglianum* (*Aglaon* × *Lambaniamum*), claret-red with white margin, the broad lip being white in front; and *Odontodia Madeline auriferum* (*Oda. Charlesworthii* × *Odm. crispum*), a large, clear yellow flower with red blotches on the sepals and petals.

MESSRS. J. CYPHER AND SONS, Exotic Nurseries, Cheltenham, were awarded a Silver Flora Medal for a well-arranged group containing over fifty distinct species, hybrids being included. The variously tinted *Masdevallias*, arranged with a selection of *Laelio-Cattleyas*, *Brasso-Cattleyas* and *Odontoglossums*, the last named having fine forms of *O. excellens*, *O. Jasper*, *O. Fascinator* and *O. ardentissimum*, *Brasso-Laelio-Cattleya Veitchii* and *B. L.C. Trine* were specially good; *Epidendrum gattonense* (*Bouddii* × *xanthinum*) bore numerous heads of reddish-yellow flowers, the plants having flowered continuously for the last eight months.

MESSRS. J. AND A. McBEAN, Cooksbridge, staged a group of scarlet *Odontodias*, showy *Odontoglossums*, and *Laelio-Cattleyas*, for which a Silver Flora Medal was awarded. Specially noteworthy were the new *Odontodia Brenda* (*Oda. Bradshawian* × *Cochlioda Noezliana*), a bright scarlet flower with well-defined yellow crest to the lip; *Odontodia Elaine* (*Oda. Charlesworthii* × *Cochlioda Noezliana*), a good red; blotched *Odontoglossum crispum*, and *Cattleya Mendelii striata*, with purple lines on the bluish white petals.

MESSRS. SANDER AND SONS, St. Albans, were awarded a Silver Banksian Medal for a varied group of *Laelio-Cattleya Fascinator*, the handsome *L.C. Hyeana* Sander's variety, good *Brasso-Cattleyas*, *Odontoglossums*, and an interesting selection of rare species.

MESSRS. STUART LOW AND Co., Jarvisbrook, Sussex, were awarded a Silver Banksian Medal for a group in which the *Laelio-Cattleyas* and forms of *Cattleya Mossiae* were very attractive. Mr. J. E. SHILL, The Dell Gardens, Englefield Green, showed fine cut spikes of *Laelia purpurata Schroderea*; *Laelio-Cattleya Anholite*, L.C. Anceuda, the new L.C. Monte Rosa (*L. purpurata Schroderea* × *C. Suzanne Hye de Crom*), white with purple front to the lip; and *Brasso-Laelio-Cattleya Schreglossa* (L.C. *callistoglossa* × *C. Schroderea Niobe*), a rose-coloured flower with yellow disc to the lip.

Messrs. FLOREY AND BLANK, Slough, again showed *Ochotinda* St. Quentin (Oda, Zephyr \times Odm, *Wiganianum*), with two spikes of clear yellow flowers with red blotches on the inner parts of the segments; also the new *Laelia-Cattleya* Cadorna (L.C. *Ceres superba* \times C. Mendelii), with bluish-white sepals and petals and ruby-purple front to the well-formed lip; and a large white form of *Miltonia Bleuana*.

Narcissus and Tulip Committee.

President: Mr. E. A. Bowles (in the chair), Miss Willmott, Rev. Joseph Jacoby, and Messrs. J. T. Bennett Poe, J. Duncan Pearson, F. Herbert Chapman, W. F. M. Copeland, Herbert Smith, Chas. H. Curtis (hon. secretary), and C. W. Needham (visitor).

AWARD OF MERIT.

Tulip Eclipse.—This is a large, handsome Darwin variety, with bold, rounded segments of fine form and substance. The base of the flower is exceptionally beautiful, being deeply glistening blue, outlined with dazzling white. In growth and general appearance this variety appears to be robust and vigorous, and it is a brighter and more attractive flower than *Harold*, with brownish-red colouring that is redder than bright mahogany. Exhibited by Messrs. DORRIS AND CO.

GROUPE.

Messrs. DORRIS AND CO., Edinburgh, put up an extraordinarily fine group of May-flowering and Darwin Tulips. The blooms were remarkably clean and fresh, and of large size. The staging of large stands of the different varieties was first-rate, none of the colours clashing. White Swan and Inglescombe Yellow were splendid, while *Norah Ware* was so well presented that a Cultural Commendation was awarded for these flowers. *Eclipse* and *Harold* were shown; the former proved the brighter and more attractive variety, and a fine addition to the deep red section. (Gold Medal.)

In point of variety the group of Tulips contributed by Messrs. BARR AND SONS, King Street, Covent Garden, was the most interesting, as Cottage, Darwin, Old English and Bombardier varieties were all represented. A bold effect was produced by grouping the mauve and lilac shaded varieties together, but we have seen the firm arrange their flowers more artistically than on this occasion. The Black Kepla and the glowing pink Duchess of Westminster were two outstanding varieties in this exhibit (Silver-gilt Florist Medal).

Tulips were shown in capital style by Messrs. SUTTON AND SONS, Reading. It was unfortunate that so many of the blooms showed the marks of hailstones; however, this did not detract from the general effect, which was fine. The deep yellow *Avis Kemford*, an American variety, was very noticeable in this collection. (Silver-gilt Bankian Medal.)

Clara Butt, the pale, creamy *Gertrude* and Orange King attracted attention in the display made by Messrs. R. WALTER AND CO., Goldchester (Silver-gilt Bankian Medal.)

Messrs. R. H. BARR, LTD., Wisbech, set in a large group of sturdy, stout-stemmed flowers, which were particularly fresh and erect; Darwin varieties were those mostly represented, but the late-flowering sections were also included in this comprehensive group. (Silver-gilt Bankian Medal.)

Fruit and Vegetable Committee.

President: Messrs. J. Cheal (vice-chairman), Owen Thomas, J. Harrison, W. H. Dwyers, J. G. Weston, A. Bullock, F. Jordan, Edwin Bockett, J. C. Allegro, A. W. McCallie, G. P. Berry, and W. Wilks.

Messrs. SUTTON AND SONS, Reading, were awarded a Silver Knightian Medal for remarkably fine tubers of this season's crop of Potatoes. The varieties were *Ashley*, *Harlinger*, *Carrisbrook Castle*, *May Queen*, *Kingleader*, *Dunmottar Castle* and *Gladstone*.

The Hon. Mrs. R. GREVILLE, Polsofen Lacey, Borking (gr. Mr. H. Prince), was awarded a Silver Knightian Medal for a collection of vegetables.

HORTICULTURAL CLUB, May 8.

LECTURE ON NARCISSUS DISEASE.

(Continued from p. 207.)

For experimental purposes, it was necessary to divide bulbs into two classes, viz., healthy and diseased, and a simple method was devised in order to distinguish them. As clean a sample as it was possible to obtain was classed as healthy, and a diseased stock was obtained of the same variety. Of the diseased stock, all bulbs which were evidently badly diseased and incapable of growth were discarded. The others were topped by cutting off a quarter of an inch or so of the bulb at the neck. After a little experience, it was possible to distinguish with confidence the brown scale affected with *elworm* from the brown scale resulting from natural decay and withering. The healthy bulbs were treated in the same manner. Topping is not detrimental, providing it is performed shortly after the bulbs are lifted. At such a time the growing part is not touched, and the bulb heals its wound before planting time arrives. As a precaution the cut neck should be dipped in sulphur as a preventive against other diseases. There is a point in connection with the topping of bulbs which must not be lost sight of, more particularly in compound bulbs. It sometimes happens that the *elworm* spreads from the neck of the parent bulb down to the basal plate, along which it travels to the offset. Should the disease originate in the offset, it may in like manner affect the parent bulb. The disease then spreads upwards from the base, usually attacking all the scale leaves. In such cases each nose of the bulb must be topped, as there may be no trace of the rot, but if one nose only is cut. Bulbs thus affected, however generally exhibit rotteness at the base.

It will be of interest to mention the fact that *Tylenchus* has been found in both the mature and immature carapels of the flower. In the mature carapels examined no seeds had formed, but it is quite possible that had seeds developed they would have contained *elworm*, *pedum*, from the analogous case of *Oats*, which when infected in the grain, presents an appearance as though attacked by rot. It has often been said that the disease never makes its appearance in seedlings until after the bulb flowers. This seems unlikely, and experiments to test it are being arranged. One raiser went so far as to say that as soon as he found a seedling he killed the bulb. On going into details of cultivation the writer was informed that the seedlings were pricked into beds in cold frames, where they remained until they were of flowering size, and then they were planted in the open ground. The bulbs flowered the first year, and those found desiring of a name obtained ground. The next year the disease made itself evident, and thus this hybrid is no doubt justified in making the above remark. If, however, the seedlings had been pricked out into beds in the open air instead of in cold frames, the results might have led him to a different conclusion. If *Onions* are affected as soon as they germinate, there is every reason to assume that *Narcissus* may be likewise attacked.

I am of opinion that *Fusarium* plays only a small part in causing disease. During the investigation at least two species of *Fusarium* have been isolated in pure cultures and plants have been inoculated in the following manner: (1) On the wound left by removing the flower stem; (2) on the injured foliage; and (3) on the uninjured foliage. The plants were grown under bell glasses in the greenhouse at a temperature of about 60° C. The experiments are at present in progress, but the fungus is of very slow growth, and any effect which it produces in a given time cannot be compared with that produced by *Tylenchus*. When healthy leaves are placed on moist blotting paper in Petri dishes, and kept at room temperature, the *Fusarium* makes rapid growth, both on injured and uninjured leaves.

Bulbs have also been revived affected by *Merodion* *Sclaria*, *Bulla* *Mite*, and *Emurcus*, while among fungi *Sclerotinia bulbosum*, *Phyllosticta Narcissi*, and *Stagonospora Narcissi* have been seen; the two latter appear on the leaves, and have not previously been recorded for this country. A quarter of a century ago there was

much controversy in the horticultural press regarding the mysterious disease known as "basal rot." It will be interesting to hear more of this disease from present-day cultivators, as it is not certain whether it is connected with the one under consideration. In an article written in 1894 by the late Rev. C. Wadley Dod on "basal rot," the word "*elworm*" is mentioned, but as to whether it was of a parasitic nature or a free-living form no remark was made. I have not seen a bulb affected with a basal rot other than that due to *elworm*.

A delicate method has been devised for testing soil for the presence or absence of *elworm*. Ten grams of soil are ground up in a mortar with 100 ccs. of water, and the muddy liquid poured into the cups of an electrical centrifuge. The centrifuge is then worked at a fairly high speed until the soil lies at the bottom of the cups. The opalescent liquid is then decanted off and spun a second time at a higher speed; the sediment now sinking to the bottom contains the *elworms*, together with other living organisms of the soil. This test is too delicate to apply to large areas of ground unless a number of samples are taken.

Tylenchus can remain for lengthened periods of desiccation as if dead, yet still retain the power of resuming vital functions on being moistened. As far back as 1744 this power possessed by *elworms* was investigated.

An experiment was performed last August by placing *elworms* on slides in a desiccator for eight weeks. On examination they were found curled up like catheine wheels, but on application of moisture a large percentage showed the eddike movement when examined three hours later. Dr. Ritzena Bos has investigated this power of *Tylenchus* with a thoroughness which stamps most of his work. He has shown that unsegmented eggs of *Tylenchus* might be safely dried for a period of two months, but if allowed to remain dry for a year only about one third recovered on being moistened; the other two thirds were dead. Eggs, however, of which the contents were divided into 2, 3, or 4 divisions, could not bear desiccation for even six days. Eggs further advanced and containing the *elworm* in embryonic condition could remain in a state of suspended animation for six months (possibly longer) without losing the power of re-animation on the application of moisture. The power of larvae to regain conditions of active life after desiccation was found to be very great, and the results of experiments carried out by Ritzena Bos showed that after suspended animation during a period of 2½ years they returned to the normal state.

The adult *Tylenchus* (that is, those in which difference in sex are discernible) could not survive under desiccation.

From the results gained it is possible to suggest some general principles which should guide the attempt to find effective and economical remedies and preventive measures. There seem to be four possible ways of this: 1, Rotation; 2, treatment of infected ground; 3, treatment of bulbs; 4, trap or "Cure" cropping.

Rotation is included among the measures of prevention. It is of importance to follow a crop susceptible to *elworm* with another that is immune. *Oats*, *Onions*, and *Chervil* are the crops which suffer most severely with us, but many other plants are liable to be attacked. When a field of *Oats*, for instance, is infected, it is a difficult matter to clear, and also to prevent the attack being carried in the manure, as some of the *elworms*, very possibly most of them, customarily leave the dying plants and go into the soil. Some are carried away with the cut crop, and being mixed up in the straw with farmyard manure are presently carried out again and spread quite unimpaired on clean fields, or perhaps in the very fields from which they came, in readiness to attack a susceptible crop. *Narcissus*, for example, if it is planted in such fields.

It should also be borne in mind that *elworms* can be conveyed in infested earth. They can be conveyed on wheels of carts and ploughs, in earth clinging to boots of workers and to farm implements, and from their power of propagation a small beginning makes much trouble. To carry out the rotation so as to starve out the *elworm*, the crops planted must be immune towards nematode attack, so that the larvae in the soil cannot find nourishment. The crop grown should

be economically profitable, and, if possible, it should be such as to enrich the land, or at least not impoverish it. It should also be one of vigorous growth so as to choke out all weeds or other plants which might harbour eelworms and permit of their development.

An ideal method of starving out the eelworm would be to allow the ground to be fallow for a long period, keeping it free from weeds by thorough cultivation. It is evident that by such a method the eelworms would be ultimately starved out, but the method would appear impracticable in the majority of cases because of its costliness.

Treatment of ground. Trenching can be applied in small areas, and to bury the eelworms as low as possible would do much to check their progress. On larger areas ploughing with a skin coultter attached will also bury the eelworms to a fairly low depth. To resort to ordinary ploughing or digging would only aid in distributing the eelworm over a larger area than previously. In the *Journal of Agriculture* for 1915 there appears a contribution on "Clover Sickness," in which it is stated that "it has been proved" in which it is stated that "it has been proved" that when eelworms are buried to a depth of 5 inches they are killed." I have, unfortunately, not yet succeeded in tracing a record of the experiments which led the writer to arrive at these conclusions. Bulls planted 8 inches deep have been found on lifting to be badly diseased.

Rich manuring, so long as there is no risk in bringing eelworms to the ground in infested manure, has been advised for other crops. One recipe found to answer well for attack in Oats and Onions was:

Sulphate of ammonia, 4 parts.
Steamed bones, 2 parts, and
Sulphate of potash, 1 part.

This was applied at the rate of 1½ cwt. to the acre, followed by a dressing of 2 cwt. of sulphate of ammonia to the acre. This mixture gave such a luxuriant growth that in a little more than a fortnight after the second dressing the unhealthy plants, if any remained, ceased to be noticeable. Sulphate of potash is also confidently recommended. Applied at the rate of 3 cwt. to the acre it answered admirably for infested Oats, and no doubt such a dressing applied to ground occupied by bulbs might definitely help the plants to resist the attacks of eelworm by increased luxuriance, and by reason of the potash hardening the leaves in texture and so impeding the entrance of the pests. It must be clearly understood that these experiments refer to the Clover crop alone. The eelworm exists equally well in heavy and light ground.

It has been seriously proposed to use steam to destroy eelworms in the field in view of the fact that this treatment has met with great success when used in the greenhouse for Cucumbers and Tomatoes attacked by the root knot eelworm. No experiments have been made in this direction owing to the expense of the undertaking. Small areas or beds, especially those to be occupied with seedlings, might be profitably steam sterilised by the inverted fan method. Sterilisation with chemicals, such as formaldehyde, toluol, carbon-bisulphide, or naphthaline, also offers possibilities of cleaning infested ground.

(To be continued.)

ENQUIRIES

WATERPROOFING.—Can any reader inform me how to render cotton sheeting and cartridge paper waterproof and transparent, as a substitute for glass, in making temporary shelters for Vegetable Marrow plants and others? *T. H.*

RABBIT MANURE. Is it advisable to use the droppings from domesticated rabbits for vegetable culture? There seems to be some deleterious property, for although grass around the stools of wild rabbits always grows luxuriantly, neither horses, cattle, nor the rabbits themselves will eat it, so it is possible that vegetables grown with the aid of rabbit manure may likewise be affected. *B.*

CROPS AND STOCK ON THE HOME FARM.

ROOT CROPS.

The preparation of the land for the root and forage crops intended as food for sheep and cows should now claim the attention of the farmer. Turnips are required for sheep in July and the following six months, and for cows in milk in October and November. The crop makes a good preparation of the soil for future crop crops. Swedes are valuable for cattle in small quantities in October and onwards, and for sheep from February until the end of May. Rape is mainly grown for sheep in August, September, and October, as a preparation for Wheat, and again for the ewes and lambs in January and onwards until the end of May, to be followed by Oats and Barley, or again sown with Rape, fed off by sheep, and sown afterwards with Wheat.

Root crops generally follow straw crops, which have exhausted the natural properties in the soil. The artificial manure added for the root crop, the preparation of the soil and the feeding of the crop on the land, is an excellent procedure for another corn crop to follow. In this way the land is systematically recuperated, and thus shows the value of sheep, especially on light soils in hilly districts, where it is not possible to obtain sufficient farmyard manure.

Where roots are required to be fed to cattle in stalls the Turnips and Swedes are carted off the land, as artificial manure has to be supplied, although the cultural method of manipulating the soil is the same.

Often the root crop follows Oats, which may have succeeded Clover or old Sanfoin ley, in a foul state—through such weeds as Couch and Dock. Such land needs much preparation before it is in a fit state to receive another crop. The month of May is a good time for weeding and cleaning operations, as the weather at that time is often hot and dry, thus facilitating the cleaning of the land. Assuming that the land was water ploughed, it should now be cut across to disturb the growing Couch and disintegrate the soil thoroughly. Dragging should be the next operation, to loosen the Couch and bring it to the surface. A light roller will crush the clods and make easier the removal of the soil from the Couch by the chain harrows, which, following, will roll the Couch into small heaps. The weed should then be burned in small quantities. The present lighting regulations forbid fires at night. After the Couch has been cleared, the land should be again ploughed, repeating the dragging and harrowing operations until but little Couch can be seen. These details require much time and labour, but when complete there is the satisfaction of a good prospect of a clean field for some years; it is useless to attempt to grow good root crops in foul land.

All too often, owing to dry weather at drilling time, in May and June, it is difficult to obtain a satisfactory root "plant"; the seed does not always germinate freely in the dry soil. The best method of ensuring an even "plant" is to plough the land afresh and sow at once before the surface soil becomes dry again, even if this entails ploughing and sowing the same day. The extra ploughing will provide a better tilth, the soil moisture is conserved, the seeds germinate quicker, and the plants make headway faster than when the surface is rough and cloddy. Moreover, the Turnip tilth is more troublesome in lumpy soil; therefore, the value of a fine tilth cannot be over-estimated. The time to sow the seeds varies according to circumstances, such as requirements and locality. Turnips may be sown from the middle of May until the early part of August. Swedes in the Southern Counties should not be sown before the middle of June, as they are liable to attacks of mildew in dry weather in July. In the North of England and Scotland sowing is done much earlier.

The varieties of Turnips are numerous. For the first batch, for use in July, the White Pomona or White Globe produces much food. For October, Lincoln Red is suitable, growing in bulk; Imperial Green Globe is an excellent variety for use from October to February; it is proof against ordinary frost, and maintains its quality and good qualities. For late use Horns Green Round may be recommended as almost

proof against frost, the roots burying themselves under the surface of the soil.

Of Swedes there are many varieties. Dunn's Delance is a heavy cropper of excellent quality. Imperial Purple Top is a capital type for evenness of crop and quality. *E. Molyneux.*

APPLE SHOOT DYING. *Pulver.* The branches were attacked by canker, which is probably the cause of the large branch dying. American Blight may, as your gardener suggests, have infested the tree at one time, causing the swellings to which you refer. The fungus would gain admittance through the wounds caused by the American Blight. You can do little to check the disease beyond cutting out the affected parts below the cankered portions.

GARDEN BEET FOR SWEETENING JAM. *R. C. H.* We question whether the garden Beet would be effective in sweetening Plum jam, if both are used in equal proportions. It does not seem to be sufficiently recognised that sugar forms only a very small percentage of the Beetroot, and when this is extracted there is a very great deal of residue. By using it for jam this residue would go into the preserve, giving it a rankish flavour. Most people who are trying Beet for preserves are using the white-rooted Sugar Beet, because its sugar contents are larger. The reports from those who have tried this blending of Beet with jam are conflicting, but there is nothing to prevent your making a further trial, provided you can get your roots ready for the Plum harvest. It should always be borne in mind in regard to such matters that a result which some would regard as a failure would appear to others as a satisfactory makeshift during a time when the best jam cannot be made. (See also pp. 111, 119, 123.)

NAMES OF PLANTS. *Constant Reader.* 1. *Swainsona galegifolia* alba; 2. *Centaurea gymnocarpa*; 3. *Byonia dioica* (Bryonia).—*Reader (Kent).* *Lepidium Smithii* (one of the Cresses).

NARCISSUS FLORE PLENA. *W. G. R.* It is not surprising that your plants of the double-flowered Narcissus failed to bloom indoors, for the variety is totally unsuited for forcing. The plant needs moist, cool conditions, and is a very uncertain bloomer even in the open. Old-established clumps give the best results.

PEACH LEAVES. *Prob.* The foliage of your Peach tree is affected with Shot-hole disease, caused by the fungus *Cercospora circumscissa*. Spray the trees with the ammoniacal solution of copper carbonate, and repeat the spraying at intervals.

PERPETUAL FLOWERING CARNATIONS. *R. W.* Shorten the shoots of the old plants growing in 6-inch pots and repot them into receptacles 8 or 9 inches in diameter. With regard to those rooted this spring, and now in 5-inch pots, shift them into 7-inch pots and transfer to a cold frame.

VINE UNHEALTHY. *W. S.* As four out of five of your Vines are doing well in the same house, the fault is probably with the soil in which the one in question is planted. It may have been too wet, too dry, or sour through having too much manure. From your description, it appears that there is not sufficient root action to support the leaves and flowers. If the Vine is retained, its roots should be laid bare in early autumn, and replanted in fresh, sweet soil.

Marigold.	per doz.
Primula.	per doz.
Rose.	per doz.
Salvia.	per doz.
St. Geranium.	per doz.
Tulip.	per doz.
Verbena.	per doz.

These are the principal flowers now on sale. A few bunches of Double White Stocks find a ready sale. Best blooms of Double Roses and Carnations are a little scarcer. Some fine spikes of Larkspur and Antirrhinums are on sale, and small quantities of house-grown Gypsophila are available, which find a ready sale. There is an abundant supply of outdoor Tulips, chiefly Parvius, Richardia (Arms) are finishing, but Liliums are so far sufficient for the demand. Lily of the Valley chiefly consists of outdoor blooms. Orchids are more plentiful, and are offered at low prices. They chiefly consist of Cattleyas and Odontoglossums, with a few spikes of Cymbidium. All scarlet flowers are expected to advance in price towards the end of the week. White and scarlet kinds will be in demand for the Whitstuntle decorations. There is still a limited supply of Smilax but Asparagus and all other foliage is reduced in price.

Vegetables: Average Wholesale Prices.

Strawberries.	per doz.
Tomatoes.	per lb.
Walnuts.	per cwt.

REMARKS.—The market may now be said to be almost empty of Apples, and Peas are likewise not obtainable. Mangoes and Lemons are scarce and expensive, but Grapes, both Black Hamburgh and Muscat of Alexandria, are fairly plentiful for the time of year. Supplies of Peaches and Nectarines are increasing daily, and Melons and Figs are also more plentiful. Supplies of no-fringe coloured Strawberries are arriving daily, and supplies of green Gooseberries are also increasing. Continental Asparagus is practically over, but much larger quantities of English Asparagus are arriving. Cucumbers are much scarcer than is usual at this time of year, but Tomatoes, both English and Channel Islands, are daily increasing in numbers. New Potatoes, Peas, Beans and Radishes are sufficient to meet demands. There are some good Cabbages and Broccoli on offer, but Spring onions are at present limited in supply. Mushrooms are fairly plentiful, and Rhubarb is both plentiful and cheap. Potatoes (South African) are now on offer in cases of about 84 lb. R. H. R. Covent Garden Market, May 25, 1917.

THE ONLY GARDENERS' DIRECTORY.

The Horticultural Directory and Year Book for 1917 is the ONLY Directory that exists of gardeners and gardeners in the British Isles.

If you want a list of all Nurserymen and Seedsmen, Sundriesmen, Hot-house Builders and other traders closely connected with horticulture, consult the ONLY Horticultural Directory.

Should you desire to trace the whereabouts of the young men you associated with in the Botchy you have no other means of finding out their present addresses than by turning to the ONLY Directory of British Gardeners.

Obtain a copy and see if your own name is there, and if it is not, then send us particulars for inclusion in the edition for 1918.

The Year Book part of this unique volume contains descriptions of all the new plants, flowers and fruits certificated in 1916, notes on the principal gardeners who died during that period, and much additional information of great value to all amateur and professional horticulturists.

We are still able to offer some few copies of the current number. Readers are advised to send their orders early, before the work is out of print.

GARDENING APPOINTMENT.

Mr. George Rowland, for the past 4 years and 6 months, Gardener to Lady Stray, The Bell, Blandy, as Gardener to Lady Howard, Gilmear, Bland, Blandy (Thanks for 1s. 6d. for R.G.C.F.P. box.—E.H.).

SELECT LIST OF BOOKS ON GARDENING

To be obtained at the "GARDENERS' CHRONICLE" OFFICE from the Librarian.

Prices Quoted are in all Cases Post Free to any part of the United Kingdom.

- English Flower Garden, The.** An Illustrated Dictionary of the Plants Used, and Directions for their Culture and Arrangement. By W. Robinson. With numerous Illustrations. 15s. 7d.
- Ferns, The Book of British.** By C. T. Drury. Illustrated. 5s. 10d.
- Ferns, Choice, for Amateurs.** For the Garden, Conservatory and Stove. Illustrated. With full directions for their Cultivation, and Formation of Ferneries, Rockeries, etc. By George Schneider. New Edition. 3s. 11d.
- Fern Culture.** By A. Hemsley. Well illustrated. 2s. 9d.
- Ferns and Fern Culture.** By J. Birkenhead. Third Edition, revised by F. Parsons. 1s. 2d.
- Fertilisers and Manures.** By A. D. Hall, F.R.S. 5s. 5d.
- Flora, British, Handbook of the.** By Geo. Bentham. Revised by Sir Joseph Hooker. Seventh Edition. 9s. 5d.
- Flora, British, Illustrations of the.** By W. H. Fitch and W. G. Smith. 1,315 Wood Engravings. Revised and enlarged. 9s. 5d.
- Floral Decoration, British.** By R. F. Felton. Containing 26 full-page Illustrations (12 in colour). 4s.
- Florists' Bibliography, The.** By C. Harman Payne. Second Edition, with Supplement and Index. Cloth, 5s. 4d.
- Flower Garden, The.** By T. W. Sanders. The Formation and Management of a Garden, and the Culture of Outdoor Flowers and Plants. 450 pages, 104 Illustrations. 8s.
- Flowering Plants, Classification of.** By Alfred B. Rendle, M.A., D.Sc. Vol. 1. Gymnosperms and Monocotyledons. 400 pages. Illustrated. 10s. 10d.
- Flowers and Flower Culture.** By H. W. Ward. 8d.
- Flowers, The Book of Hardy.** By E. H. Jenkins. A Practical Guide to the Cultivation of Hardy Flowers. Illustrated. Cloth, 2s. 11d.
- Flowers, The Book of Old Fashioned.** By Harry Roberts. 2s. 10d.
- Forestry, The Development of British.** By A. C. Forbes. Illustrated. 11s.
- Forestry, The Practice of.** By Percival T. Maw. A voluminous and practical manual. It deals also with the financial aspect of Forestry. 17s. 6d.
- French Market Gardening.** By John Weathers. With practical details of "Intensive Cultivation" for English Growers. Preface by W. Robinson. 3s. 11d.
- Fruit Farming, Practical, for Commercial Fruit growers and others.** By Cecil H. Hooper. 3s. 10d.
- Fruit Farming for Profit.** By George Bunyard. A practical treatise on all the more profitable Fruits. Sixth Edition. 2s. 9d.
- Fruit Garden, The.** By George Bunyard and Owen Thomas. 15s.
- Fruit Growing, Profitable; for Cottagers and Small Holders of Land.** By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiteers. Illustrated. 1s. 3d.
- Fruit, Hardy, Culture for Amateurs.** By S. T. Wright, with notes by W. D. Drury on Fungi affecting Fruit Trees. Illustrated. 1s. 3d.
- Fruit Ranching in British Columbia.** By J. T. Bealby. Illustrated. 3s. 11d.
- Fruit Trees and Their Enemies, With Spraying Calendar.** By Spencer Pickering, F.R.S., and Fred. V. Theobald. Cloth, 1s. 9d.
- Fruit Trees in Pots.** By Josh Brace, twenty-two years Foreman for Thos. Rivers and Son. Illustrated. 5s. 4d.
- Fruit Trees, The Scientific and Profitable Culture of.** From the French of M. Du Breuil. Fifth Edition, carefully Revised by George Cluney. With 187 Woodcuts. 3s. 9d.
- Fruit and Vegetables, Packing and Selling; for Cottagers and Small Holders of Land.** By R. Lewis Castle. A Gold Medal Essay, written for the Worshipful Company of Fruiteers. Illustrated. 1s. 3d.
- Fungoid Pests of Cultivated Plants.** By Dr. M. C. Cooke. Many Coloured Plates. 5s. 6d.
- Garden Beautiful, The, for Home Woods and Home Landscape.** By W. Robinson. Illustrated. 7s. 10d.
- Garden Planning and Planting.** A Guide to the Laying out and Designing of Flower Beds and Borders. Illustrated. Paper, 1s. 5d.; cloth, 1s. 9d.
- Garden, Chemistry of the.** A Primer for Amateurs and Young Gardeners. By Herbert H. Cousins, M.A. 1s. 2d.
- Garden Craft in Europe.** By H. Juigo Trizgs. 21 15s. 6d.
- Garden Designs, The Book of.** By Charles Thonger. 2s. 10d.
- Garden Flowers for Town and Country Gardens.** By John Weathers. Coloured Plates. 5s. 4d.
- Garden Furniture, The Book of.** By Charles Thonger. 2s. 9d.
- Garden Guide.** By Walter P. Wright. A Practical Handbook for all Garden lovers. 100 Illustrations. Cloth, 1s. 9d.
- Garden Plants, A Practical Guide to.** By John Weathers. Contains descriptions of Annuals, Biennials, Perennials, Flowering and Ornamental Trees and Shrubs, Conifers, etc., and also the best kinds of Fruits and Vegetables that may be grown in the open air. 1,192 pages. 163 Illustrations. 21s. 6d.
- Garden Receipts.** Edited by Charles W. Quin. Fourth Edition. 1s. 8d.
- Garden, The Well Considered.** By Mrs. Francis King. 4s. 10d.
- Garden Under Glass, The.** By W. F. Rowles. Contains much practical information. Price 6s. 6d. Illustrated.
- Garden Series** (edited by R. Hooper Pearson).
My Garden in Spring. By E. A. Bowles, M.A., Chairman of Scientific Committee of Royal Horticultural Society. With Preface by Reginald Farrer. 320 pages. Contains 16 Coloured Plates and 24 Half-tones. Price, 5s. 6d.
My Garden in Summer. By the same author as above. Price 5s. 6d.
My Garden in Autumn and Winter. By the same author. Issued 1915. Price 5s. 6d.
- Gardener's Assistant, The.** New Edition by William Watson, Curator, Royal Gardens, Kew. 6 vols., cloth, 8s. 5d. each. Also in 2 vols., Roxburgh binding, 52s.
- Gardeners' Chronicle Horticultural Directory** (58th Year.) Revised edition for 1917. This unique Horticultural Directory contains, amongst other valuable information:—A Register of the principal Nurserymen, Seedsmen and Florists, Mansions of the United Kingdom, with their Occupiers and Head Gardeners, Horticultural Builders and Engineers; Landscape Gardeners, Horticultural and Floral Societies; Fruit, Flower and Vegetable Trades Societies, Principal Fruit and Flower Salesmen and Commission Agents in London. List of County Staff Instructors in Horticulture appointed by the County Councils. Principal Public Parks in Great Britain and Ireland. Indispensable to every Nurseryman and professional Gardener. Every possible means is taken to revise this work each year; this involves over 15,000 communications by post, as a form for verification is sent to every name included in the lists. Published on January 1 each year. Price 1s. 4d.
- Gardening, Alphabet, of.** By T. W. Sanders. Illustrated by diagrams. 1s. 9d.
- Gardening, Encyclopedia of.** By T. W. Sanders. A Dictionary of Cultivated Plants, Flowers, Fruit, Vegetables, Trees and Shrubs, with Description and Popular and Technical Names, Cultivation, etc. 466 pages. 3s. 11d.
- Gardening, Home.** By W. D. Drury. A manual for the Amateur, containing instructions for the Laying out, Stocking, and Cultivation of Small Gardens. 1s. 3d.
- Gardening, Pictorial Practical.** Edited by Walter P. Wright. Illustrated. Paper, 1s. 3d.; cloth, 1s. 9d.
- Gardening, School, A First Book of.** By A. Logan. 1s. 9d.

EXPENSIVE ADVERTISING. In these days, when every firm has to advertise or so it may be, it is necessary to make sure that the best plan possible is obtained. The results justify the expenditure. It is this consideration that has led most keen business men to discontinue the wasteful method of advertising by catalogue. It compares the make of any printing firm it will be found that catalogue printing has fallen away since the war by about 80 per cent., not is this to be wondered at. The price of paper is nearly three times what it was formerly, printing rates are higher, and the cost of postage is now increased. But the wholesale distribution of large catalogues is now too expensive for business purposes. The newspaper, though they themselves are produced at a high charge, a space all round have nevertheless retained it from more a long time, for advertisements and it is by utilizing those permanent media that profitable advertising may still be practised.

SPORTSMEN Farmers, Horsemen, try our splendid Yorkshire Whipcord, made by the leather, also a pair of 75 yards for 7s. 6d. Patterns free.—**BRADFORD WOOLLEN CO.**, 71, Bradford.

Protect Your Potatoes

Works: Stoke-on-Trent.

PROTECTION against the Potato's worst enemy—Blight—is absolutely essential. Blight cannot be cured; but it can be prevented if the crop is sprayed in time with a reliable mixture such as

Keelings Spraying Mixture (Kilin Brand)

which is the mixture approved by science. Can be used with an ordinary garden sprayer—keeps in any climate—good for fruit trees. Harmless to other plants.

4 lbs. (makes 25 gallons of mixture, sufficient for 1 acre). Price, in 4 lb. bags, 4 6; 8 lbs., 8 -; 16 lbs., 13 6; 32 lbs., 24 -; all carriage free in U.K. Special prices for larger quantities. Send P.O. with order direct to the Manufacturers.

NOTES FROM A GALLOWAY GARDEN.—VI.*

ON a morning in April I watched a thrush plastering the inside of her new nest with the orthodox mixture of mud and rotten wood. It was a pretty sight, for the bird had chosen a bush of Rhododendron arboreum set with rose-coloured flowers, wherein to rear her brood. I have described the medium as mud; Yarroll and other writers on ornithology specify clay; but this thrush would have to fly long journeys to find real clay, and doubtless used the ordinary loam of the borders. The weather, and consequently the surface of the ground, were very dry at the time, and it occurred to me to wonder how she (or he) moistened the dry soil to make it plastic. There is no water near enough to be handy; yet when I put my hand into the nest, the walls were quite wet. Is it possible that the song thrush is enabled to finish its nest in the manner peculiar to it by a development of the salivary glands similar to that of birds of the swift family? The extreme instance is the Chinese architect of the edible birds' nests (Collocalia), which nests are esteemed by the Chinese gourmets as stuck for soup, though they consist almost entirely of the salivary secretion of the birds. To-day (May 3) there are four eggs in the nest that was being plastered a week ago.

The gardener's task at this season always consists largely of a hand-to-hand conflict with weeds, and this year victory rests in most gardens with the weeds. Amateur aid may be forthcoming, but is not always free from risk, as I felt when a fine tuft of *Wahlenbergia graminifolia* was rooted out of our rock garden by a good-natured young lady who had undertaken to conduct a raid upon Dandelions and grass so easily recognisable. The plant was duly labelled, but her education had not included Latin, therefore "*graminifolia*"—grass-leaved—conveyed no warning to her diligence!

Occasionally a garden gains fresh beauty through neglect; at least, one learns what good effect may sometimes result from following Lord Melbourne's axiom in politics: "Why can't ye leave it alone?" I came across a notable instance of this lately in the garden of Glasserton, in Wigtownshire, the residence of Admiral Johnston Stewart. The grounds, originally laid out on a grand scale, require

gravel paths, to which a clipped Yew hedge runs at right angles, cutting off another side of this mighty bush. But for this it must have spread to a circumference of 200 feet. The height I could not ascertain, but it is certainly between 18 and 20 feet. The whole plant was a sheet of golden blossom a magnificent sight. These dimensions considerably exceed those of a bush of *Berberis luxifolia* (dulcis) which we have here, viz., 114 feet in circumference and 18 feet high. It is not often that flowering shrubs are given room enough to show their full capabilities for display. The time arrives to every planter when he finds himself in a painful dilemma as to what must be sacrificed in the interest of something else. If he shrinks from the sacrifice, the result is disastrous, for a congested shrubbery is a distressing sight.

Owing to scarcity of labour this season many shrubs must have escaped the mischief so generally inflicted on them through a rage for "tidying up." The annual leaf fall provides not only natural

FIG. 80. TRILLIUM GRANDIFLORUM AT MONREITH.

more than an ordinary amount of labour to dress and keep them, owing to an extensive and complex arrangement of grass terraces. These cannot now be shaven and shorn as in the piping days of peace, neither can the flower beds be made ablaze with colour in spring and summer, as of yore. But sweet are the uses of adversity. Round a large circular bed, formerly studded with bulbs which are no more, there was planted as part of the design a ring of *Scilla sibirica*. The plants have endured, outlasting more ephemeral things; and not only endured, but prospered exceedingly, spreading into a broad, dense band of azure, whereof the beauty has to be seen in order to realise how to treat this hardy little bulb. To me, at least, the appearance it presented in mid-April was a revelation of its capabilities.

This mention of Glasserton must serve as an excuse for referring once more to *Berberis pinnata*, for I think a specimen there must break the record for size. I measured the circumference carefully last week and found it to be 135 feet. One side has been severely cut back from a

nourishment, but an excellent mulch, protecting the soil from frost and scorching sun. This is especially important for such shallow rooters as *Rhododendrons*; yet it is a common practice to rake the dead leaves off and wheel them away. One day last winter I was sorely tempted to renounce with two men whom I saw diligently engaged in scraping bare the ground under the shrubs in St. James's Park. Methought they might have been put to more profitable employment.

Staphylea trifoliata, raised from seed introduced by Mr. Wilson in 1908, is flowering here for the first time. The blossoms are pink, in short, few flowered corymbs, decidedly pretty, but not showy.

One has heard complaints about *Morista hypogaea* that it suffers from cold feet, is prone to damp off in winter, and should be treated to the luxury of a Moraine. We have no Moraine bed here, but plenty of patience, and exercise of that quality is certainly necessary in getting young plants established, for they are not only slow in getting on their legs, so to speak, but until they increase into considerable

* For previous articles see Jan. 13, p. 15; Feb. 17, p. 69; March 10, p. 105; April 14, p. 149; and April 25, p. 169.

patches, run serious risks at the hand of an inexperienced or careless weeder, so nearly do the leaves resemble those of some of our native crucifers. A pugny in height, *Morisia* owes its value to the luminous yellow of its blossoms, which it produces in such profusion as to conceal all the foliage except the outer fringe of the patch. Moreover, it continues a long time in bloom; having opened its first flower here on January 10, it is still a brilliant object on May 25. In his useful handbook on Alpine plants, Mr. W. A. Clark recommends a top-dressing in November of gritty loam and leaf mould, but we never succeeded well with it till we applied some sifted mortar rubbish. It is a most companion for *Diaba* (*Petrocallis*) *pyrenaica*, flowering simultaneously, and being of similar lowly stature.

The cultist of the terrestrial Orchids to flower is *Cypripedium calceolus*. Like most other things, it is a fortnight behind time this year, the first bloom opening on May 25, whereas it generally begins to flower in the first or second week of that merry month. It is more than thirty years since I bought up the whole stock—some twenty clumps—of an amateur who was leaving his home in Surrey, and it has been a joy ever since, growing vigorously in half-shade in a border of loam, peat, and lime. Somewhere or other, I have read a pathetic story about this, the queen of British Orchids. Long after the ruthless greed of collectors had caused it to disappear from the rest of its native haunts in Yorkshire, a few plants remained in a woodland attached to a certain vicarage in that county. The vicar, dreading the inevitable result of allowing these survivors to flout their showy blooms of canopy and chocolate, took the precaution every spring of picking off the flower-buds before they opened, whereby the roots escaped detection by raiders.

Not until mid-summer shall we know the full extent of loss ensuing upon the severest winter in two-and-twenty years. Meanwhile, we appear to have fared better than we dared to expect. The Chinese plants introduced by Messrs. Wilson and Forrest have stood the test bravely; and older species, retarded by the cold of April, have produced a deluge of blossom the like whereof is seldom seen. *Herbert Maxwell, Monroth, Weymouthshire.*

ORCHID NOTES AND CLEANINGS

NEW HYBRIDS

BRASSO-LAELIA JESSICA. A two-flowered inflorescence of this pretty and delightfully fragrant hybrid between *Brasso-Laelia Jessopii* (B. Digbyana × *L. xanthina*) and *Brassavola glauca* is sent by Pania Rath, Esq., Ashford Park, Surrey (Orchid grower, Mr. W. H. White), in whose gardens the plant is flowering for the first time. The flowers are finely formed, five inches in width, the petals broad, well displayed, and the whole flower partaking of the thick, wax-like texture of *Brassavola glauca*. In *Brasso-Laelia Jessopii* the assertive yellow of *Laelia xanthina* prevailed, but in the crossing again with the white, greenish-sepalled *Brassavola glauca*, the yellow has nearly vanished, showing only a faint trace on the greenish-white sepals, and still less on the white petals. In the lip the tubular form of *B. glauca* appears, but in the expanded white front lobe, with its slightly fringed margin, *B. Digbyana* shows its features. The disc of the lip is pale yellow, and the under side of the column purple.

CYPRIPEDIUM GENERAL PÉTAIS. Mr. F. C. Puddle, gardener to W. H. St. Quinton, Esq., sends a flower of *C. General Pétain*, raised between *C. Hera Euryades* (*Boissalii* × *Leucumii*) and *C. Psyche* (*bellatulum* × *niveum*) in Scampston Hall Gardens, Rillington, Yorks. The flower, which is finely formed, has petals nearly

two inches in width and of firm substance. The ground is white, the dorsal sepal having broad, irregular lines of claret-purple, and the petals profuse spotting of the same colour. The lip and staminate have minute purple markings, and the reverse side of the flower is tinged and spotted with claret colour. Mr. Puddle, in his letter, makes an interesting remark, showing the variation in complex hybrids. "Of this cross we have flowered two plants in which *C. Hera Euryades* dominated, and they were weak, whereas, as you can see by the flower sent, with *C. Psyche* dominating, the hybrid is quite a good thing."

SOPHRO-LAELIA STELLA.—A two-flowered inflorescence of a remarkable hybrid, obtained by crossing *Laelia superbiens* with the pollen of *Sophronitis grandiflora* some years ago in the Tring Park Gardens, Tring, is sent by Mr. Arthur Dye, the gardener. The seed capsule and young seedlings were watched for years with considerable interest, and imagination pictured a very much greater departure from *Laelia superbiens* than is shown in the resultant hybrid. Evidence of the correctness of the cross, however, is ample, and the conclusion is that, as

FIG. 21. HYBRID SOPHRO-LAELIA STELLA.

in some other cases of wide parentage, *L. superbiens*, while taking on certain minor features of the other parent, does not yield in point of size, colour, and habit. The flowers are over four inches across, and coloured rosy mauve, with white midribs. The petals are broader than those of *L. superbiens*, and the curve of the sepals faintly suggests *S. grandiflora*, whilst the shorter lip deflected in front with yellow markings in the centre, and the thinner dark roscolumn, with white anthercap, also indicate that species.

LAELIO-CATTLEYA PSYCHE. Mr. Dye also sends a fine three-flowered inflorescence of *Laelio-Cattleya Psyche*, raised in Tring Park Gardens between *Laelio-Cattleya elegans* and *L.C. Nysa superba*. In size and general appearance of the flower, it is nearest to *Cattleya Warecewiczii*, which, with *Laelia crispata*, produced *L.C. Nysa*, and the usual defects in the labellum caused by *L.C. elegans* (*C. Leopoldii* × *L. purpurata*) are happily obliterated. The sepals, petals, and tube of the lip are silver-white, flushed with rosy lilac. The front of the lip is coloured mauve-purple, the disc being pale yellow, deepening into light orange at the base.

CRUSOE'S ISLAND: JUAN FERNANDEZ.

(Continued from p. 211.)

ANSON'S VISIT IN 1741.

IN 1741 the island sheltered Anson's expedition on its voyage around the world. The chaplain of the "Centurion," the Rev. Richard Walter, gives a very complete account of the doings of the expedition which is well worth reading. The "Centurion" arrived under the lee of the island on June 10, after a dreary voyage from Cape Noir. A great number of the crew had died of scurvy, and very few were left to man the sails and work the ship. Walter says: "those only who have endured a long series of thirst, and who can readily recall the desire and agitation which the ideas alone of springs and brooks have at that time raised in them, can judge of the emotion with which we eyed a large cascade of the most transparent water, which poured itself from a rock near a hundred feet high into the sea, at a small distance from the ship. Even those amongst the diseased, who were not in the very last stage of the distemper, though they had been long confined to their hammocks, exerted the small remains of strength that were left them, and crawled up to the deck to feast themselves with this reviving prospect." One can imagine the disappointment of these much tried mariners when night closed in and still no suitable anchorage had been discovered. Owing to the imminent risk of running on shore with the strong current, the anchor was let go during the night, and their helplessness was such that next morning the anchor could not be started from the ground until a friendly breeze filled the sails and dragged it from its resting place. The crew of the "Tyral" sloped in as even a worse plight, since no fewer than thirty-four men had died of scurvy, and those that remained were so afflicted with the malady that only the captain, the lieutenant, and three of the men were able to stand by the sails. The stricken crews were at length landed on Juan Fernandez, not a few of them dying en route, and afterwards on account of their weak condition. The Cabbage trees, goats, Water cress, and a vast profusion of Turnips and Sicilian Radishes, with abundance of fresh water, soon restored the health of the survivors. They found many acres of ground covered with Oats and Clover. "The excellence of the climate and the looseness of the soil render this place extremely proper for all kinds of vegetation, for if the ground be anywhere accidentally turned up, it is immediately overgrown with Turnips and Sicilian Radishes." Mr. Anson, therefore, having with him garden seeds of all kinds and stones of different sorts of fruits, he sowed Lettuces, Carrots, and other garden plants, and set in the woods a great variety of Plum, Apricot, and Peach stones, and these last, he has been informed, have since thriven to a very remarkable degree.

Describing the interior of the island, Walter continues: "Some particular spots occurred in these valleys, where the shade and fragrance of the contiguous woods, the loftiness of the overhanging rocks, and the transparency and frequent falls of the neighbouring streams, presented scenes of such elegance and dignity, as would with difficulty be rivalled in any other part of the globe. It is in this place, perhaps, that the simple productions of unassisted nature may be said to excel all the fictitious descriptions of the most animated imagination." Walter speaks of the malicious manner in which the Spaniards had introduced a large number of dogs into the island in the endeavour to extirpate the goats in order to deprive their enemies of provisions with which goats' flesh furnished them. At the time of Anson's visit there were not more than two hundred goats left, and these had taken refuge in the most inaccessible localities and were very difficult to approach. The shallow nature of the soil was the cause of a fatal accident to one of the sailors. Whilst pursuing a goat he caught hold

of an overhanging tree to prevent himself from slipping, but it unfortunately gave way. In his fall he seized hold of another, but it also broke loose, and he fell amongst the rocks and was dashed to pieces. Describing the sea elephants or sea lions as he calls them, which were at first such a terror to poor Solliak, Walter says they are, when mature, anything from 12 to 20 feet in length, and from 8 to 15 in girth. Some idea of the appearance of these curious creatures may be gathered from the accompanying sketch (see fig. 82), copied from *Anson's Voyages*. They appear to divide their time equally between land and sea, continuing at sea all the summer and coming on shore at the setting in of the winter, where they reside during the whole season. At this time they bring forth their young, of which they generally have two at a birth. These they suckle with their own milk. Walter relates that a sailor was one day carelessly employed in skimming a young sea lion, when the female from which he had taken it came upon him unperceived, and getting his head in her mouth scored his skull in many places, wounding him so severely that he died in a few days. They live in families and societies, and feed on fish and mollusks, especially turtle-fishes. The skin furnishes leather, the oil is valuable for burning; the tongue alone is really palatable. At the time of Anson's visit, the Parahis had been practically exterminated by the dogs introduced by the Spaniards, as also the progeny of Solliak's cats. The expedition remained on the island about three months, when they were sufficiently recovered to commence serious operations amongst the Spanish merchant ships.

In 1750 the Spaniards decided to establish a colony on Juan Fernandez, and the President of Chile sent one of his superior officers as Governor, with a strong detachment of soldiers. They occupied Cumberland Bay, built a small township, and at great expense erected several forts and batteries at different points. The situation was evidently a suitable one for the practice of corruption and waste, and the Spanish proverb was often levelled at the administration, "Entre piosos y azules, van el bones" (between pick axes and hoes, many a million goes), though fortunately in this case millions of pesos and not pounds! Guns without mountings were dragged up the heights, where they were quite useless as weapons for the defence of the place, which, indeed, was never likely to be attacked. The establishment was kept up for several years at great expense, sheltering a number of political exiles as well as convicts condemned to hard labour during their term of imprisonment. Among them was a French military officer of rank and superior scientific attainments, who threw himself into the bay where he was confined, now called El Francois, no doubt on account of this melancholy occurrence. *J. Hutchinson, Ken.*

(To be continued.)

ON INCREASED FOOD PRODUCTION.

NOTES ON PLANTING BROCCOLI.

Broccoli is liable to severe injury from frost, and for this reason cultivators should take every precaution to keep the plants sturdy and hardy. The seed should be thinly sown in an open position, upon soil not too rich, ample space being allowed between the plants. Firmness of soil will check luxuriance, and encourage fibrous root growth, and it is sometimes advisable to plant upon plots that have remained undug after having been cleared of their previous crop. Quarters cleared of Strawberries have, for instance, been utilised in this way. Where the soil is very retentive, however, this method has sometimes led to failure owing to the soil being excessively hard. In the kitchen garden here, which is in a low position, and has for years been deeply trenched and well cultivated, every

Broccoli plant was lost last winter, while in the fruit garden, placed on a higher elevation, crops planted on less well cultivated land were saved. *Thos. Coomber, The Hendre Gardens, Monmouth.*

WIREWORMS

The following remarks on wireworms have been forwarded us by the Board of Agriculture:—

In some places, recently planted Potatos are being damaged by wireworms, and inquiries are being made as to the means to be taken to get rid of these pests. Inasmuch as harmless soil insects are sometimes mistaken for wireworms, it is important, that the inexperienced should be able to recognise them.

A wireworm is light brown in colour with a slightly polished and somewhat tough body. It is more or less worm shaped, and has a distinct head and three pairs of small legs just behind the head. Wireworms measure up to about three quarters of an inch in length.

A wireworm is the young or larval stage of a click beetle. The insects live as wireworms for three years or even longer. They are most active in spring and early summer; in the late summer, when they often burrow deep into the soil, they are likely to do less harm. In winter, especially during cold weather, they may go so far down into the soil that they are not seen when the ground is being dug. A full fed wireworm, after burrowing deeply into the soil in late summer,

FIG. 82. SKETCH OF SEA ELEPHANT OR ELEPHANT SEAL. (V. PERRINUS). (FROM 'ANSON'S VOYAGES')

changes into a chrysalis, or "pupa," which later on turns into a beetle. In the following summer, the beetle lays the eggs from which fresh wireworms are produced.

Almost all plants are attacked by wireworm, Broad Beans less, perhaps, than other garden vegetables.

To rid a piece of ground of wireworms requires much trouble and considerable time. There is no simple remedy for this pest.

If the ground is bare of crops, digging it exposes the wireworms to the attack of birds; similarly, poultry penned on a newly dug piece of ground are useful in devouring wireworms. Naphthalene, too, at the rate of not less than 2 ounces per square yard, dug in, helps to destroy the pest; but the price of this may be prohibitive. Only so much should be spread as can be dug in on the same day that it is applied. It is not advisable to use this insecticide when the ground is under a crop. Proprietary insecticides have sometimes given good results, but at other times they have failed completely. It is unlikely that any of these remedies will succeed if they can only be applied on the surface, whilst the wireworms are far below.

The chief means for reducing damage by wireworms is to encourage the rapid growth of the crop. This may be done by applying, in the form of a top-dressing, either sulphate of ammonia at the rate of 1 lb. per rod, or soot, 1 gallon per rod. In applying sulphate of ammonia, which should preferably be in the form of a fine powder, care should be taken to

spread it uniformly and to hoe the ground immediately after the application, in order to prevent the material from burning. If the soil is dry and water is available, a thorough watering after the sulphate of ammonia has been spread will help to wash it down to the roots.

In the case of soot, this material, if taken direct from the chimney, should lie in a heap for a week or two before being spread on the soil. Another means of reducing the damage done by the pest is thorough cultivation. If frequently. If any such roots as Carrot, Beet or Mangold are available, they may be used as "baits." For this purpose, cut the roots in pieces and put a piece at the end of a short stick. Bury the pieces in the ground with the stick projecting, pull the "baits" up and destroy any worms feeding upon them.

In the case of Potatos, even if some wireworms are found attacking the seed, it should not be assumed that complete failure of the crops will result; provided that the growing parts of the plant are not destroyed, a partial crop may be obtained in spite of the presence of the pest. If, however, the attack is so severe that it becomes evident that no crop is to be expected, before planting another crop, dig up the Potatos and treat all those containing wireworms in such a way that the pests are killed. For instance, Potatos may be fed to pigs or poultry.

If transplanted plants can be obtained, Onions and Leeks may be planted. Turnips and Swede Turnips may also be sown, but care should be taken to sow sufficient seed to allow for a certain amount of loss. When thinning the crop, do not at first thin to the distance at which the permanent plants are to grow. At each thinning remove only sufficient plants to give room to the growth of the others. In the case of crops which are pricked out, keep a reserve bed to replace failures.

Good and constant cultivation extending over one or two seasons will generally reduce the number of wireworms in the soil.

THE GERMINATION OF PARSNIP SEED.

Parsnip seed may be longer in germinating this year than usual, as stated by Mr. Bartlett on p. 212, but it is habitually slow any year, and that applies to the whole of the Umbelliferae. Seeds that I sowed in April were covered with snow a day or two afterwards, yet the seedlings are up and making good progress. I have seen soft sown Parsnip seed germinate in February. It is a question of time and the warmth of the soil. Parsnip seeds need not necessarily be dormant, although they lie long in the soil. The embryo of any of the Umbelliferae ceases growing at an early stage, and at the maturity of the seed forms a very tiny body embedded in a mass of hard, oily perisperm. This latter has to undergo chemical changes by the aid of warmth and moisture in order to feed the tiny embryo, which has to make considerable growth before it can germinate. This growth can be hastened by artificial heat, as may be remembered in the case of Celery and Parsley. The seeds and embryo of the Rannunculaceae are similar in condition and behaviour; compare the slow rate of germination in Delphinium, Anemone, and Clematis. *J. F.*

BROAD BEANS AND POTATOS.

The cottager's plan of sowing Broad Beans amongst his Potatos is worthy of consideration. The Bean seeds are placed singly in alternate rows from five to six foot apart amongst the Potatos. The tuberosus crop does not suffer, and the Beans, having ample room for development, are usually very fruitful. As beans are fond of the flowers, this is an additional recommendation in many cases. *A. C. B.*

BUTTER BEANS.

The Butter Bean is the Lima (*Phaseolus lunatus*) or a variety of it, as Mr. Beckett states on p. 212. It was introduced to this country in 1818, and is stated to be a native of the Tropics, perhaps Tropical South America, but its habitat

is not positively known. Butter Beans are largely cultivated in the United States, West Indies, Madagascar, and Burma. Even in the United States the crop sometimes fails, and it cannot be grown with any certainty of success in this country. There are many varieties, the climbing sorts being known as Pole Beans. There are also Bush Limas, 18 inches to 2 feet high, some spreading and others strictly erect. The older varieties of Pole Limas have pods about 5 inches long and four-seeded. The Giant-podded Pole Lima has pods 7 inches to 8½ inches long, 5-6 seeded, and borne in clusters of four to eight. The older Bush Limas have pods 2½ inches to 5 inches long, and three to four seeded. The Burpee Improved Bush Lima has pods 6 inches long, five-seeded, and borne in clusters of five to eight, occasionally ten. Most of the varieties have white seeds, but those of the last-named are tinted with green when mature and dried. In America the term Butter Bean seems to be restricted to the small-seeded Lima, Carolina, Sieva, or Sewee, grown in the south of the United States. Some of the old Bush Limas have dry and mealy seeds, but the Fordbrook Bush Lima has juicy and sweet seeds even when mature. This is another improvement which Mr. Beckett may note when thinking of the Butter Bean of the shops. I quite agree with him that some of the Dwarf or Haricot Beans are better in flavour than the Butter Bean of the shops. I can speak from experience of Green Haricot, which must be closely related to Green Gem. *J. F.*

THE BROAD BEAN

I AM growing three to four times the usual quantity of all kinds of Beans, but prefer the Broad Bean as a food to any of the others. In some seasons large quantities of Broad Beans are dried here by laying the pods on the borders of fruit houses. There is, perhaps, a danger in using too many Kidney Beans. Some cases of Beri-beri which were brought to an infirmary were said by the medical authorities not to be traceable to any known cause, and it was suspected that the eating of large quantities of these Beans had something to do with the attack. I grow some of the Beans, and they turned out to be a variety with black and white pods. *R. P. Brotherton, Tynningham, East Lothian.*

HONEY AND FRUIT PRESERVING

THE question of the possible use of honey as a substitute for sugar in jam making and fruit preserving having been raised, the Food Production Department has considered the question. Bee-keepers who have honey to spare and, to jam, or otherwise to preserve, may utilise honey instead of sugar quite satisfactorily. The general rule is to use honey in the same quantities and in the same way as sugar for other jam or marmalade. Whether it is worth while so to utilise honey depends on individual circumstances and personal taste. Those who do not keep bees may find the price of honey much higher than that of sugar; indeed, practically prohibitive. Moreover, the supply of honey at present is very short and not likely to be large at any time this year.

BRUSSELS SPROUTS

MR. TURNER'S query, on p. 211, as to my method of growing Brussels Sprouts is reasonable. I may say that I make it a point to prove the merit of practical methods by repeated trials before publishing them, one season or two being too brief a period in which to determine the value of any practice or theory. Our Brussels Sprouts have been grown on the same ground for more than twenty years, and before that they were taken from another piece of ground for fifteen years, the rows one year invariably being planted between those of the previous year. Cultivation consists

largely in turning over the ridge of soil occupied by the crop in the preceding year, to earth-up the crop, and when pheasants are more than usually greedy, each plant has a dessert spoonful of sulphate of ammonia at the end of summer, which, however, is very seldom needed. Now, why treat them in this seemingly haphazard manner? The reason for trying it was that the Sprouts produced under the treatment usually adopted were too large and rough, while I obtain better produce by my own method. The soil here yields good crops of Broccoli and Scotch Kale, without being cultivated specially for those vegetables in any way. When pressed for time, I never hesitated to plant Cabbages and Coleworts in undug ground. Winter Spinach, of which a very large quantity has to be grown, is usually sown in Potato ground that is merely levelled before sowing the seeds. But Cabbages and Kales, as soon as time permits, have the ground between the rows forked over. Soot is applied thickly over the whole surface, but, of course, I do not limit the manure to soot. *R. P. Brotherton.*

POTATOS AND BEET.

WITH regard to my method of planting Potatoes, as recorded on p. 131, there are several limiting factors which my critics fail to notice. In regard to the Evergood variety, which ultimately grew 5 feet high, if I had known the haulm would reach that height, and had allowed a space of 5 feet between the rows, the question arises, should I have got so great a weight of produce as 22 tons? My opinion is that I should only have lifted three-quarters of that amount, or even less; therefore, instead of 22 tons 2 cwt. ware and seed per acre, I might possibly have had 16 tons 11½ cwt. My reasons for this conclusion are that the tops would have fallen down flat at the wider distance, instead of supporting each other as they did at 2 feet between the rows, and air would not have reached the roots, so well as it did. The point where overcrowding commences and the weight of crop diminishes can only be determined by experiments with each variety, and on various soils.

Mr. Beckett (p. 201) imagines, I might have grown the varieties with smaller tops closer together; yet he overlooks the fact that those early varieties require earthing-up several times if the nights are frosty, and frost is especially frequent in the Midlands. Two feet between the rows often proved an insufficient distance for this operation, for it did not permit of enough soil to cover the tops.

The fact that Beet will survive the winter in the open, unprotected, has been a revelation to many of us. I saw the plot referred to on p. 211 at Wisley, on April 25. The young leaves were coming up thickly all over it, and I have seen other cases of Beet out-of-doors this spring in gardens close to my present residence, where frost and snow were severe. But I still hold the opinion that the old plan of lifting and storing Beet in late autumn is best, provided one has a cool, moist shed where the roots can be kept from withering if a sudden frost occurred. It would be no easy matter to lift Beet from the open without injuring the roots. *W. H. Davies, Wisdhan, Hook, Surbiton.*

PEAS AND BEANS INJURED BY WEEVILS

I NOTE in your "Answers to Correspondents" a reference to weevils. Unfortunately this year these have done a considerable amount of damage in this locality to second early Peas, and also to Broad Beans. One or two long rows in our case were so disfigured that we had to sow again, and there are very many other such instances in the neighbourhood. I am wondering if it is general this season, for I know of no effectual remedy. No doubt after the welcome rains the ravages of this pest will be lessened, as they are generally most active when growth is slow owing to dry weather. *Edwin Beckett, Aldenham House, Blotter.*

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor.

COLEWORT.—Seeds of this useful vegetable should be sown at once, selecting Rosette, the best variety for early winter supplies, and Hardy Green, as this latter variety will stand through the winter and furnish good heads in early spring. Sow the seeds in an open position where the soil is not too rich, so that the plants may be grown as stocky and hardy as possible. When they are of sufficient size they may be planted in rows 15 inches apart. Continue to plant out, as opportunity arises, such crops as spring sown Cabbages to furnish heads throughout the autumn. Brussels Sprouts for late supplies should also be planted now. Autumn Broccoli and Hollow-leaf Giant Cauliflower should not be allowed to become crowded and drawn in the seed-bed, but should be planted in their permanent quarters as soon as large enough. Other plantations may be made later to continue the supply as far into the autumn as possible.

CELERY.—As soon as Celery plants are large enough they should be carefully transferred to the trenches, and a sufficient quantity of clear water applied to settle the soil about the roots. It is a mistake to leave these plants too long in the nursery bed, as transplanting them late causes a check from which it takes them a long time to recover, especially if the weather is dry at the time of planting. When the plants begin to make fresh growth, frequent light dustings of soot may be applied. Careful attention must be given to watering throughout the season. Continue to prick out plants for late supplies, giving each plant plenty of space.

EARLY POTATOS.—Special attention should be given to early plantations of Potatoes. Stir the ground deeply between the rows and earth-up the plants as they become large enough. Do not draw the soil up to a sharp ridge, but leave the top as broad as possible, so that the rain-water may reach the roots. Potatoes in cold pits should have all the air possible. Remove the lights and give a good supply of clear water to the roots. Old Potatoes in store should be examined, and all young shoots removed.

TOMATOS.—Plants intended for cultivation out-of-doors should be planted with as little delay as possible, and if wall space is available the best results will be obtained by planting 18 inches apart and confining the plants to single stems. Remove all side-shoots as they appear. A mulching of decayed manure should be applied as soon as the plants become established, and when sufficient fruits are set, liberal supplies of manure water may be given. Tomato plants from which ripe fruits are being gathered should be assisted to ripen the remainder of their crop by frequent applications of manure water from the farmyard, or by sprinkling the surface of the soil with guano previous to watering with clear, soft water. It is important that fresh air should be admitted to these plants night and day, and that the fruits be gathered before they become over-ripe.

MUSHROOMS.—The beds from which Mushrooms are being gathered should not be allowed to become too dry. Remove the litter from the surface of the beds in order to see if water is necessary or not. When necessary, rain-water may be given through a fine rose and the covering replaced the following day. Beds in the open should be protected from drenching rains, or the material may become sour and fail to produce a crop.

LEEKS.—Continue to plant Leeks as they become large enough, and keep the soil stirred between the plants to promote free growth. If dry weather sets in, give the roots a liberal supply of water.

LETTUCE.—The recent heavy rains have done much to promote the growth of early planted Lettuce, which will benefit by the free use of the Dutch hoe between the rows. Plant suc-

cessional batches, and make small but frequent sowings of approved varieties which are known to succeed well in summer. For these sowings a border should be selected where some protection from the hottest sunshine can be afforded. No time should be lost in digging all land recently occupied with winter and spring crops, so that other crops may be got in for autumn and winter use. Garden Swedes may be sown now and thinned to 1 foot apart in the row as soon as large enough to handle.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR DAVEY, Abbotts Wood, Godalming, Surrey.

INSECT PESTS.—Notwithstanding the severe winter and repeated sprayings with insecticide, there are many maggots on Plums, Damsons and Pears. The trees should, as far as is possible, be looked over and the grubs removed by hand-picking. Afterwards spray with a nicotine insecticide on both sides of the foliage. This spraying should be followed by another of a strong solution of Quassa Extract. Peaches and Nectarines should, if free from aphids, be syringed frequently with clear water in bright weather; if not clean, use about 1 quart of soluble petroleum to a garden engine of 50 gallons capacity. Direct the spray into the joints of the shoots and wet every portion thoroughly.

CHERRIES.—Cherry trees have set plenty of fruits, which should be thinned where too numerous, and more especially on early varieties, such as Early Rivers. Knight's Early Black is a good prolific early fruiting variety, whether grown as trained cordons or in fan shape. The shoots need to be stopped early to enable the fruits to develop. Nail in the branches roomed for extension, and stop all laterals about the third or fourth leaf. Use the garden engine to keep down aphids, and look over the trees diligently for maggots, which pull up the leaves to hide themselves. Protect the fruits of early varieties before the birds attack them, which they do as soon as they begin to show colour. Fasten the netting so that it hangs quite a foot from the trees.

WALL TREES.—The material used for protecting wall trees should be removed entirely and stored; the foliage will now afford sufficient protection for the fruit. Many of the new shoots on Pear and Plum trees are ready for stopping and tying. If the trees have been disbudded carefully the shoots will now require to be pinched about four or five leaves, and extra vigorous ones on the upper branch should be attended to first, allowing a few days to elapse before completing the operation. In the case of very old trees some of the more vigorous of the new shoots may be trained in to take the place of worn-out branches. Fruit trees on warm, south walls require copious supplies of water.

FRUITS UNDER GLASS.

By JAS. HEDDER, Head Gardener to the Hon. ARTHUR DAVEY, Abbotts Wood, Surrey.

PINEAPPLE.—Fruits of the Queen variety of Pineapple are swelling. Give closer attention to watering, affording occasional applications of a weak stimulant. Peruvian guano sufficient only slightly to colour the water may be used for feeding the roots. Attach much importance to watering Pineapples with water as warm as the plunging material. Let the house be closed early, use the syringe freely, and keep the evaporating troughs filled with weak liquid manure from the farmyard. Later plants of the Queen variety should be showing fruit for the autumn. Where the growth has been some that free it will be well to keep the plants drier for a few weeks, then water again; this treatment will have the desired result if, so far, they have not showed for fruit.

LATE GRAPES.—The Latest Vines, such as Lady Doreen's variety, will soon be in flower. I have noticed that this Grape usually flowers at the end of May without any attempt at forcing. When the Vines are in flower a night temperature of 67° Fahr. is suitable. This is not a free-

setting variety, and special attention should be directed to the pollinating of the flowers. It necessary use a camel's hair brush and dust with pollen from a free-setting variety, such as Black Alicante. More attention will be needed if the weather be dull and sunless. No varieties repay for careful thinning more than these late ones. Bear in mind, too, that medium or small bunches are the best for keeping in bottles in the spring.

THE FLOWER GARDEN

By W. J. CRUISE, Gardener to Mrs. DEMESTER, Keele Hall, Staffordshire.

ANTHRINUM.—The early plants of Anthrimum are ready for placing in their flowering quarters. In well-prepared ground the tall varieties should be placed 13 inches apart, but for the dwarf varieties 12 inches is sufficient. When planting beds with distinct colours examine the plants carefully for weevils, which may be detected by the difference in the foliage.

ROSES.—Syringe Rose trees occasionally to keep aphids in check, and make an examination of the foliage for grubs. Quassa Extract is a suitable insecticide for Roses. The removal of the weaker shoots will result in increased vigour in those that are left for flowering. Established plants will be benefited by liquid manure given in dry weather.

CLIMBERS.—Climbers on walls and pergolas should be trained before the shoots grow entangled. Clematises grow very quickly and need constant attention in this respect. Climbing Roses should receive similar treatment to that advised above.

HARDY ANNUALS.—Hardy annuals should be thinned directly they can be handled. A space of 12 inches is sufficient for dwarf plants, but such kinds as Lupins, Lupinus, Malope, and Lavatera need at least 18 inches. For supports place small brushwood between the plants. Soot heaped lightly in the soil serves to keep slugs in check and stimulate the roots.

ASTERS AND STOCKS. These half-hardy annuals need a light, rich soil, heavy, retentive ground may be made suitable by the addition of old potting soil, wood ash, and decayed stable manure. The plants are in good condition for planting, and the first showery day should be chosen to get them into their flowering quarters. It is advisable to have reserve plants to replace any failures.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMY COLVILLE, Bury, Garton Park, Brixton.

ODONTOGLOSSUM GRANDE AND O INSELEAYI. These Mexican Odontoglossums are developing young growths, and as soon as roots push from their base they should be repotted or top-dressed. Those that have sufficient root room for another season and with the compost in good condition should be immersed in water to soak the soil; afterwards allow them to become partially dry, when portions of the old materials on the surface should be picked from between the roots and replaced with fresh compost. Plants that need repotting should have all the old compost shaken from the roots, and be potted afresh in receptacles large enough to accommodate them for two seasons. Use a compost similar to that advised for *Dendrobium*, adding some crushed rocks. Plants of *Odontoglossum Fraz-Schuereri* are active at the roots, and should also be repotted or top-dressed as is considered necessary. All these plants grow best in summer in the warmest position of the Odontoglossum house, but they should be removed to the intermediate house for the winter. *Odontoglossum Bossii majus* and its many hybrids will require attention at the roots as they pass out of flower. These plants are best grown in plain shallow pans, and suspended from the roof rafters in the cool Odontoglossum house. Any specimens that have grown over the sides of the pans should be broken up, removing the back, leafless pseudo-bulbs save three or four behind the head, and the plants potted afresh.

STANHOPEA. This Orchid is best grown in shallow oak wood baskets, and suspended from the roof rafters in a moist, shady position, in the

Cattleya or Intermediate house. The pendulous inflorescences push downwards through the bottom and sides of the receptacles. For that reason, when replacing them in the baskets a thin layer of peat rhizomes should be placed over the bottom for drainage purposes, in preference to broken pots. At this period of the year, or directly new roots develop, fresh rooting material, consisting of a mixture of equal parts *Osmunda-fibre* or A 1 fibre and Sphagnum moss in rather coarse portions, should be afforded the plants. Plants that require increased rooting space should be given receptacles that will accommodate them for at least two seasons, as they dislike frequent root disturbance. Plants that have sufficient rooting space and good compost should be merely top-dressed afresh, removing a portion of the old soil to permit of this being done. Water the roots sparingly during the earliest stages of growth. Spray the foliage on frequent occasions, and especially the under sides of the leaves, to prevent attacks of red spider.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORFOLK, Eastwell Park, Kent.

TUBEROUS BEGONIAS.—Tuberous-rooted Begonias give the best results indoors when they are grown in cool conditions, but if the plants are required to bloom early in summer it is necessary to encourage growth by a little extra warmth, though conditions approaching forcing treatment must, at all times, be strictly avoided. Tubers that have been stored during the winter will start freely into growth if placed in boxes containing a little rough leaf soil. The mould should be kept slightly damp. As soon as they have rooted the plants should be potted to prevent damage to the roots in separating them. Place them in receptacles of suitable sizes according to the strength and age of the tubers, or, if preferred, direct into their flowering pots. Do not allow the roots to become pot-bound or growth will be checked. Use a light, open soil consisting chiefly of turfy loam and rough leaf-mould. If the latter is not of good quality a little manure from a spent Mushroom bed may be added, with a little sharp sand and soot. Grow the plants in a low box or frame with a moist bottom, and damp them lightly overhead in bright weather, but do not over water the plants in the early stages. As growth advances more space should be given, for on plants that are crowded the leaves and stems become drawn, and the blooms suffer in quality. Shade the plants from hot sunshine. Pick off all the flower buds until the plants have filled their pots with roots, when the latter may be stimulated by regular feeding.

SALVIA SPLENDENS. Cuttings of *Salvia splendens* struck last month should be potted on as required. Pinch the points of the shoots at intervals to ensure a bushy habit. Plants rooted from cuttings, early in the season, make large specimens in the same year if treated liberally. *Salvia* may be planted out during the summer and lifted in September. If lifted carefully and shaded heavily for a time afterwards the plants give good results indoors. Those grown in pots should be plunged in a bed of ashes in the open. Syringe the foliage regularly in the afternoon, using weak, clear soft water occasionally to keep down attacks of red spider.

BOUVARDIA. *Bouvardia*, raised from cuttings rooted this spring should be repotted as required and kept growing in a house having an intermediate temperature. The compost should consist of turfy loam mixed with leaf soil and sand. Pinch out the points of the shoots to ensure a bushy habit. Do not over water the roots, but damp the plants overhead lightly twice daily, and keep the surroundings damped. Old plants which were cut hard back after resting and shaken out, should be potted on, or as an alternative planted out in a frame, or on a south border, but planting out of doors is not suitable for gardens in cold districts. Pinch the shoots once or twice, but do not continue this practice too late in the season. Syringe the plants regularly in hot weather.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. All communications should be written on ONE SIDE ONLY of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR JUNE.

TUESDAY, JUNE 5.—

Roy. Hort. Soc.'s Com. meet. Masters' Memorial Lect. at 3 P.M.

Orchids, at 67 and 69, Chiswick, E.C. 2, by Prothero & Morris, 11, Arwick.

Pure Line Breeding.

The usefulness of the now well-established method of breeding from single plants is well illustrated by the work in the breeding of improved races of Oats which has been carried on in Maine by Messrs. Surface and Zinn.* In the case of Oats, as in that of most other cereals, there is no complication due to crossing, and once a pure line is established as the result of breeding from a single individual, it maintains its characters indefinitely. This method of improving varieties lends itself particularly to practice by commercial men who have seed-testing stations, for they begin with the knowledge only obtained as a result of prolonged experience of what are and what are not qualities which it is desirable a given plant should possess. In order to make clear the principle underlying the method of pure line breeding, the famous example given by Johannsen may once again be described.

In a commercial sample of Beans it will be found that seeds of various sizes small, medium, and large—occur. If

the object sought be a large Bean, a plant breeder might think that by picking out a single large Bean and growing it he would next year obtain a plant all the seeds of which are large. In point of fact, he might or he might not. For the large seed which he chose might be a member of a line pure for large seedfulness, or again it might only represent the largest seed which a race of average size is capable of producing. Therefore, in order to obtain a race with uniform large seedfulness the plant-breeder picks out and grows separately, not one, but a dozen or more large seeds. The behaviour of the plants shows him at once which are pure to large seedfulness: for in those that are, although their seeds will show a range of size, all the seeds are on the large side. Those seeds in turn, whether the largest or the smallest are grown, will produce plants which are large-seeded. Once the pure line is isolated, selection will do nothing to improve the quality of size, and the larger and smaller seeds will produce similar sized progeny.

In the case of Oats studied by Messrs. Surface and Zinn, pure-line breeding led to the isolation of races which gave an average yield of 80.8 bushels as against 75.2 bushels—the average of eleven commercial varieties. Needless to say, in breeding for a particular quality the other necessary qualities must not be lost sight of; and it is because seedsmen who regularly conduct trials are of all people those most familiar with the necessary "points" of plants that we suggest that this method of pure-line breeding should be adopted as part of their routine of plant-improvement.

SUSPENSION OF THE KEW BULLETIN. The Controller of H.M. Stationery Office, hitherto publisher of the *Kew Bulletin of Miscellaneous Information*, has advised the Editor of the *Bulletin* that he has been instructed to form a priority list for printed books, and to defer the publication of everything which is not essential; that it has been ruled that the *Kew Bulletin* is not essential, and that its publication has, therefore, been suspended.

A FUNGUS WHICH ATTACKS CANVAS.—A communication* from Mr. J. RAMSBOTTOM on the subject of the destruction of canvas by fungi draws attention to the work of F. GRÉGARIS (*Comptes-rendus*, t.lix, [1914], p. 781), who has identified the canvas-attacking fungi as members of the Pyrenomyces (*Phlepospora infectoria* and *P. hebarum*).

OVERHEAD ELECTRICAL DISCHARGE AND CROP PRODUCTION.—Under the above title Professor BLACKMAN and Mr. L. JORGENSEN describe the remarkable results produced by the overhead electric discharge on Oats grown by Miss DEBORAH at Dunfermline. The discharge was started on April 14, the day after the seedlings appeared. Already, by May 16, a marked difference was apparent between the electrified and unelectrified areas, the electrified plants being taller and greener. The difference in yield was enormous, for whereas the controls yielded from 20 to 22 bushels the electrified area (1 acre in extent) yielded about threefold these amounts (62.3 bushels). The authors have also observed that the discharge appears to have a beneficial after-effect, for the Clover-Hay produced in

1916 on the area electrified in the previous year was distinctly better and gave a bigger crop than in the non-electrified parts of the field. The experiments which were begun last year at the R.H.S. Gardens, Wisley, and which are being continued in the present year, should, in view of these remarkable results, prove extremely interesting.

HUMOGEN.—An account of the tests made by Dr. RUSSELL at Rothamsted and by the authorities at the Harper Adams Agricultural College, is no more favourable to humogen than have been other recent tests carried out in the open at Wisley and elsewhere. It would serve no useful purpose to describe the results, since, in a note attached to Dr. RUSSELL'S paper, Professor BOTTOMLEY attributes the failure of the humogen to an error in its mode of preparation. We trust that before further experiments are made Professor BOTTOMLEY will give the experimenters a guarantee that the material has been properly prepared. It is a serious tax on the patience of investigators to go through all the laborious work of making a test and then to learn that the material has not been properly made. The error appears to have been due to causes beyond Professor BOTTOMLEY'S control, but it is none the less to be deplored.

THE GERMINATION OF SEEDS.—In a paper* read before the Horticultural Society of Charlotte, TOWERS, Mr. E. MANN drew attention to the great differences in germination of seed according to the place in which it was raised. He cited the case of Phlox, seed of which imported from England gave only 10 or 20 per cent. germination in Queensland, whereas seed of his own raising in that hot climate gave 85 per cent. Raisers of new seedling Chrysanthemums might take a hint from this. Mr. MANN avers that Aster seed gives even worse results than Phlox, and states that from £5 worth of seed, enough to raise 20,000 plants, he succeeded in getting only three seedlings. On the other hand, in the case of Lupinus, Mr. MANN finds that seed ripened in Queensland is so hard that it has to be chipped before it will germinate. If, however, the seed be taken before it is ripe, it germinates readily enough. Mr. MANN mentions a curious observation which he has made with respect to Sweet Peas. If planted in April in Queensland, the Sweet Pea grows well with out a check and flowers in August; but if, in order to produce early flowers, the seeds are sown in March, the seedlings, after growing about 2 inches, die off. The earlier planting is done the more the seedlings die off. He cites as examples of the irregularity of germination so common among seeds, the case of the Petunia, and, if planted in hot weather, Celery and Lettuce.

AUSTRALIAN VEGETABLE RESOURCES.—Mr. R. T. BAKER, the Curator of the Technological Museum, Sydney, New South Wales, is directing the energies of his staff to the utilisation of home products in the preparation of articles of domestic and other requirements, such as were imported previous to the war. The Institution was primarily founded to assist trade developments by scientific, industrial research, by advice, and by furnishing reports on the natural resources of the country. The Museum exhibited various articles at the Panama Exhibition, and from Mr. BAKER'S annual report we learn that the awards were a Gold Medal of Honour for Eucalyptus oils and tanning barks; a Gold Medal for prepared timber, and for Australian flora in enamelled and silver work; Silver Medals for office furniture, ceramics decorated with Australian flora, essential oils, and ornamental building stones. The Department of Agriculture was equally successful in its exhibits. Australia is peculiarly rich in vegetable resources, and a filip has now been given to their scientific investigation.

* "Studies on Oat Breeding." IV.—Pure Line Varieties. Ann. Report of the Maine Exp. Station for 1916.

* Notice, May 10, 1917.

* Queensland Agric. Journal, VII.

DIDYMOSPERMA DISTICHUM see fig. 851.—The name of "Fan-palm" may well be applied to the remarkable and rare Indian Palm, *Didymosperma distichum*. This curious tree grows to a height of 50 or 40 feet, the leaves being arranged along two sides of the stem only, after the manner of a gigantic fan. The leaf bases are effectively set off with sheaths of a very fine network of brown fibre. An avenue of this Palm forms a striking feature in the Botanic Gardens at Peradeniya, in Ceylon. The figure in the photograph, kindly sent us by Mr. HUGH F. MACMILLAN, is a Kandyan native (of Ceylon), in the typical dress of his race.

THE WORD "POMPON."—Mr. HARMAN PAYNE writes to say that we misprinted his paragraph on the word "Pompon" last week. It should have read that the final "e" appears in the N.D.S. schedule this year for the first time, not that it appears in all the society's publications.

MR. PROTHERO AND THE GARDENERS COMPANY.—On Thursday last Mr. R. E. PROTHERO was elected a member of the Worshipful Company of Gardeners, one of the old City companies, in accordance with the following resolution:—"That the honorary freedom of this Company, and (with the approval of the Court of the Lord Mayor and Aldermen) the freedom of the City of London, be given to the Right Honourable ROLAND EDWARD PROTHERO, M.V.O., M.P., President of the Board of Agriculture and Fisheries, in recognition of his distinguished services to agriculture and horticulture in the present national crisis. The ceremony took place in the Bakers' Hall, Han Lane.

AN OLD REMEDY.—We were somewhat taken aback the other day by the makers sending us a sample package of the insecticide Cyclist Compound. It was quite unnecessary, for it is nearly forty years since the writer first employed this preparation, and he has always found it as "safe as the lead," for use against the common garden insects, particularly aphides, red spider, and thrips. No gardener need be afraid of ill-effects from the use of this old remedy if he will take the trouble to follow directions.

FLORA OF NEW SOUTH WALES. The first supplement to MAIR'S and BUCHANAN'S *Flora of New South Wales*, Plant has appeared. It comprises the Freshwater Algae by G. T. PRYDE, following G. S. WEST'S classification in his *Fresh Water Algae*, of 1904. Preceding the enumeration is a summary of the differences between West and ENOTHER'S systems, the chief of which is the exclusion by West of the Flagellatae and Bacteria, the former being referred to the animal kingdom and the latter treated as a group outside the Algae. Upwards of 1,000 species and varieties are enumerated. These belong to 150 genera, grouped under eight orders.

WAR ITEMS.—Captain (Acting Major) J. L. VETTER, youngest son of Mr. PETER C. M. VETTER, of Exeter, has been mentioned in a despatch from the Commander in Chief, Sir DOUGLAS HAIG.

Mrs. LLOYD GRUBB has joined the Ladies' Committee of the War Horticultural Relief Fund.

PUBLICATIONS RECEIVED.—*Jottings of a Gentleman Gardener*. By I. T. ELLIS (London: L. Reeve & Co., Ltd.) Price 3s. 6d. net.—*Agricultural Co-operation and Organisation*. By George Radford, 2nd Edit. (London: Hodder & Stoughton.) Price 3s. 6d. net.—*The Forest Flora of New South Wales*. Vol. VI., Part X, Part IX. of the complete work. By J. H. MAIDEN. (Sydney: Government of the State of New South Wales.)—*The Rose Annual, 1917*. By H. R. DARRINGTON and COURTNEY PAGE, (National Rose Society, 25, Victoria Street, Westminster.) HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE GLORY OF APPLE BLOSSOM.—People travel considerable distances to see the Plum blossom at Evesham and Pershore, and the great sheets of whiteness presented to view are no doubt very striking. There is a monotony in the display, however, which contrasts unfavourably with the brighter colouring, and size of Apple blossom, which stands supreme over even that of the Cherry and the Pear in beauty. The sight presented by Apple orchards recently in the southern parts of England was more splendid than I can remember ever having seen it before. There was hardly a variety grown by me which failed to show at least a fair quantity of the strongest

blossom to a sudden collapse, littering the ground with petals. *Southern Grower.*

PEA WEEVIL (SITONES LINEATUS).—This most injurious beetle is very much on the increase both in field and garden, and the damage done to crops is enormous. I find in many gardens that the unweaved Pea foliage is often ascribed to birds, but in the majority of cases this is not so, the gnawing being due solely to the destructive influence of the Pea beetles, and not the birds. The beetles are rather difficult to detect, as they are very sensitive to danger, and when anyone approaches them they invariably drop from the plant to the soil, and either hide under particles of earth or remain as if dead until the danger is past. One would think after a severe winter such as we have experienced that the chrysalids would have been killed, as they hiber-

FIG. 851. DIDYMOSPERMA DISTICHUM IN THE BOTANIC GARDENS, PERADENIYA, CEYLON.

blossom, and in most cases there was a great profusion. The only exceptions were among trees too young to make much display, and patches of alternate year trees, which bore great crops last season. There are gradations of beauty even among the varieties of Apples, however. Lord Derby stands first among varieties grown by me in beauty of blossom, particularly when its flowers are only partly expanded, so that the deep shade of pink of the buds is noticeable. Royal Jubilee ranks next in colouring, followed by Domino, Irish Peach, Lane's Prince Albert, Guy's Orange Pippin, Pat's Seedling, Blenheim Pippin, Bramley's Seedling, Newington Wonder, James Grieve, Forge, and a few others. Among the least coloured are Bismarck, Duchess of Oldenburg, Worcester Pearmain, Lord Grosvenor, and Early Julian. The thunderstorm of Sunday night brought the glory of Apple

into only a few inches under the soil. I have tried several remedies for the destruction of these beetles, such as spraying with a strong solution of nicotine, and dusting on separate occasions on the damp foliage shaked lime, wood ashes, and soil. I have also tried a solution of paraffin 2 ounces to 1 gallon of water, but this latter proved injurious to the foliage of Beans. The above remedies seem to hold them in check, but do not kill outright; therefore I should be grateful to any reader who could recommend a practical remedy for their immediate extermination. *G. H. H. H.*

PROPAGATING VIOLETS (see pp. 206 and 215). Fresh numbers are Nature's method of reproduction. I admit, but I read the statements of Mr. E. H. Jenkins from a different point of view from Mr. Bartlett's, and agree with the

former. Many fail to grow Violets to their satisfaction, for, instead of making a new plantation in spring from a bed in the open, they use runners, or divide the old plants that have been in the frames all the winter, and have had their constitutions badly impaired by insufficient ventilation. Such plants generally become a prey to Violet disease (*Phyllosticta violacea*), which destroys the leaves, as I have had ample evidence during recent years. J. F.

ANEMONE PULSATILLA.—I was interested in Mr. Dyke's statement on p. 203 of the way this flower flourishes in poor, sandy soil. Here I have it growing in stiff clay, practically free of lime, and with no lime added. The plants were raised from seed about six years ago, and have had no manure of any sort, yet they flourish exceedingly. C. E. Fletcher, Bromfield, Yalding, Kent.

ΧΙΟΝΟΔΟΧΑ ΤΜΟΛΙ.—Referring to the remarks on this very pretty (*Chionodoxa* on pages 186 and 206, it is, I suppose, undisputed that it takes its name from Mount Tmolus, in Asia Minor, in the ancient province of Lydia, referred to by the Roman authors Ovid and Pliny. The plant has certainly been very unfortunate in the variety of ungrammatical appellations given to it, especially as to their endings, though such spellings as *Tmolus* and *Tmolusii* (with an "n" replacing the "m"), are, no doubt, printers' errors. There is not the very smallest doubt as to what the spelling should be. The word *Tmolus*, being actually Latin, or at least adopted and formed as such by the Romans, had its genitive, *Tmolusii*, formed as all the other words in "us" of the second declension. It therefore requires no special connecting of a genitive, as when a purely English name like Jenkins has it tacked on to it as in *Dendroica Jenkinsii* in supposed imitation. I presume, of a Roman clan name such as *Cornelius*, making its genitive *Cornelii*, but of course in this case the first "i" formed part of the stem, not of the ending marking the case. Surely, when the Latin word is in actual existence, and known, we do not want to improve on it, either by inserting an "i" before the casual ending, or still worse, by tacking a genitive ending on to a nominative one. The word *Tmolus* also existed as an adjective derived from *Tmolus*, and meant "of or belonging to Tmolus," or, as one might say, *Tmolian*. *Chionodoxa Tmolii* would therefore strictly mean not the *Chionodoxa* of Mount Tmolus, but of some person or thing connected with the mountain. This is not what was meant, of course. The inserted "i" is apt to be very misleading, and is quite out of place where names of Latin origin, in which it does not occur as part of the stem, are used, as, for instance, in the case of *Leopold*, latinised into *Leopoldus*, the genitive of which is certainly *Leopoldi*, not *Leopoldii*. But certainly the addition of one ending on the top, so to speak, of another, is worse, as in *Tmolusii*, which I believe is the form usually appearing in catalogues. It reminds one of the abbreviation, *Cathaya Trianae*, used instead of *C. Trianae*, appearing some time ago frequently in the *R.H.S. Journal*. The improver on the name did not content themselves with substituting the masculine termination "i" for the supposed feminine one, i.e., but tacked the former on to the other as if the man's name had been *Triarius*. There were, of course, many Roman masculine names of the first declension in "a," so *Triarius* was quite right. It would almost seem as if some classical author (as) was required as censor to prevent too great havoc being made with the Latin language. *Eustace F. Clark.*

HARDINESS OF SHRUBBY VERONICA.—The two Veronics enclosed are commonly cultivated here in Broadstairs, both on the "front" and in all sorts of gardens in and around the town. Both are New Zealand types, I believe, and they weather ordinary winters without injury, but the odd last killed the one with thick leathery leaves whilst the other, having rigid pointed, Pimpernel-like leaves, is unscathed. The small leaved, bushier kind is of fastigiate growth, with, usually, several nearly equal stems from near the base, rising to a height of 7 or 8 feet. *H. Bolting Irishy.* The large leaved variety is a form of *V. Andersonii*; the other is *V. Traversii*.—E.J.S.]

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

MAY 22. *Present:* Dr. A. B. Rendle, F.R.S. (in the chair), Col. H. E. Rawson, Messrs. W. J. Benn, J. Fraser, W. Hales, W. Allard, J. W. Odell, W. C. Worsdell, and F. J. Cliftenden (hon. secretary).

Gall on Rhododendron ferrugineum.—Mr. W. C. Worsdell showed specimens of the well known gall on *Rhododendron ferrugineum*, due to the attack of the fungus *Exobasidium Rhododendri*. This gall usually occurs on the leaves, but in one case on the plants shown it was on the corolla.

Varieties of Pyrus Aria.—Mr. J. Fraser showed specimens and commented upon the forms of *Pyrus Aria* which he had collected from wild sources in Surrey. Among them was one approaching the variety *sulcifolia*, and another of the variety *magistica*. The latter is particularly interesting for it is the form known as the Nepal Service tree, or *Pyrus Aria nepalensis* (though it is not known to occur in Nepal), and is generally assumed to have originated in nursery grounds.

Attention in folioli of Tropaeolum.—Col. Rawson exhibited a plant of *Tropaeolum tuberosum* to show what he considered to be the sun's influence in causing the leaves to divide, as they normally do, into any number up to five lobes. The division had been observed taking place at critical altitudes of the sun, which had confirmed previous years' observations. Prior to the leaf dividing, precipitation was seen to take place from the margin inwards, which indicated the exact vein affected. This precipitation, which was reversible, he associated with the starch of the tuberosus plant considered to be a colloidal phenomenon.

Tuberous flowers of Narcissus.—From two sources came tetramerous flowers of *Narcissus*; in each case there were eight perianth pieces, eight stamens, and four carpels. The tetramerous condition of these flowers seems, therefore, not uncommon, and it is not rare in nearly allied plants.

NATIONAL TULIP.

MAY 22. The National Tulip Society usually holds its annual exhibition on the second day of the R.H.S. show at Chelsea, but the latter exhibition having been abandoned, it was held in conjunction with the R.H.S. fortnightly meeting on the 22nd ult. The exhibits were much fewer in number than usual.

Mr. A. D. Hall, Eburyast, was the largest exhibitor, but neither he nor Mr. W. Peters, Gun Lodge, nor Mr. H. S. Bartlett, Shooters Hill, nor Messrs. Barr and Sons, entered for competition, though they all grouped their flowers more or less in accordance with the schedule.

Mr. HALL'S exhibit of Old English florists' Tulips contained a fair number of varieties, and his specimens of Annie McGregor and Tabman, both flamed and feathered, were especially good. Mr. HALL showed several new seedlings of his raising; these were of good quality, and one, of rose colour, with a fine, pure white base was much admired. The bases of many of the seedlings were of cross shape, very few having the circular base which is considered necessary to perfect form. Mr. HALL was awarded a Silver-gilt Flora Medal, while his variety named *Attraction* was adjudged the premier feathered variety, and his *Glean* the premier breeder flower. This collection was awarded a Silver-gilt Flora Medal by the Royal Horticultural Society.

Mr. WALTER PETERS, Forest House, Cambridge, had a small collection of sloped and finely-coloured Old English Tulips. Mr. PETERS, like Mr. C. W. Needham (who was present) and Mr. A. D. Hall, is an enthusiastic member of "the tany." Some of his best flowers were *Lazze*, *Mabel*, *Sam Barlow* (the premier flamed Tulip), *Annie McGregor*, *Elizabeth Pegg*, *Adonis*, *Sir Joseph Paxton* (rather dark, and needing a little more yellow), and *Garibaldi*. Mr. PETERS has rarely shown better, and his three flamed flowers, *Sir Joseph Paxton*, *Mabel*, and *Duchess of Sutherland* were capital specimens. The

Royal Horticultural Society awarded the collection a Silver Flora Medal.

Mr. H. S. BARTLETT showed a fine bloom of *Goldfinder*, the "runner up" for the premier breeder flower, while his bloom of *Adonis* was excellent.

MESSRS. BARR AND SONS had a small stand containing *Adonis*, *Annie McGregor*, *Sam Barlow*, and other old favourites.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MAY 14.—The monthly meeting of this society was held at the R.H.S. Hall on the 14th ult., Mr. Chas. H. Curtis in the chair. Five new members were elected. Seven members withdrew double the amount of interest, amounting to £22 15s. 10d. Three members over the age of seventy years were allowed to withdraw sums from their deposit accounts amounting to £34 8s. 2d. The death certificate was produced of one deceased member, and the Army Forms of Sergeant W. T. Almond and Private J. Perks, who had been killed in action, and the sum of £93 12s. 10d. was passed for payment to their nominees.

HORTICULTURAL CLUB, LECTURE ON NARCISSUS DISEASE.

(Concluded from p. 218.)

MAY 8.

The treatment of bulbs by soaking has received much attention. Last autumn about 3,500 diseased bulbs and the same number of healthy ones were treated with different chemical solutions. The experiments are being continued, and the results will be published in due course.

Hewitt recognised some time ago that *Tylenchus* was connected with the disease, and in a paper entitled "Edworm in Narcissus Bulbs," published by the Department of Agriculture and Technical Instruction for Ireland in 1912-1913, recommends soaking the bulbs in copper sulphate solution at a strength from 5½ per cent. to 7½ per cent. for 17 hours. On a recent visit to Ireland it was understood from one firm who had worked in conjunction with Hewitt that the treatment advised had been abandoned, as the results did not prove satisfactory. Hewitt died before his investigation was concluded.

Experiments designed to ascertain the temperature which edworm will stand give the following results:—Between 45° and 44° C. all edworms were killed at the end of 45 minutes; at a temperature between 43°-49° C. the edworms succumbed at the end of 15 minutes; 52°-53° C. 11 minutes; 53°-54° C. 9 minutes; 55°-56° C. 9 minutes; and 57°-58° C. 5 minutes.

The effect of temperature on the eggs was not considered. When bulbs are placed in hot solutions, the temperature of the bulb in the interior is 5° F. below that of the solution at the end of one hour; at the end of two hours the temperature is 3° F. lower; and at the end of four hours there is no difference.

No matter in what manner the bulbs are treated it is courting disaster to plant again in infested ground, and even land which has never before been utilised for bulb culture is not necessarily free from *Tylenchus*, seeing that this edworm is capable of attacking some of our commonest grasses and weeds.

TRAP OR "CREP" CROPPING.—In 1880 Kuhn devised a method of reducing the injury caused by the edworm *Heterodera Schachtii* in Sugar Beet, based upon the principle of trapping the edworms in some susceptible plant and destroying the crop before the nematodes again entered the soil. He used a species of Rape for the trap crop, which was sown and removed from three to five times in the season. The number of edworms was reduced by this method, and profitable crops could be grown again for several years. This method has more recently been employed in America for controlling the root-knot edworm, but without success. For the edworm under investigation a suitable trap crop may be found, but it will have to be one of which the seed is cheap, of easy culture, showing great susceptibility to attack, of quick growth, and one which can be readily removed.

It appears to be generally held by growers that bulbs naturalised in grass escape the attacks of *Tylenchus*. If this be true, can it be certain grasses attract the eelworm, or that soil conditions of grass land, such as lack of air, are unsuitable for the development of eelworm? Or is it, as is well known, that certain grasses excrete toxins, which in their turn render the soil unfit for the eelworm? On the other hand, bulbs grown for naturalising are generally planted in drifts and left undisturbed for years, and, as a consequence, grow freely, so that should any succumb to the disease they are not missed. One large grower in Guernsey seems so convinced that bulbs in grass land are unaffected that he has left his beds unworked, and is experimenting in other directions.

In this country the treatment of *Narcissus* bulbs attacked by eelworm had received no attention except from Hewitt. Last July, when I had convinced myself that eelworm was probably the cause of the disease, I wrote to Prof. Litzenma Ios concerning *Fusarium*, and he gave his opinion that eelworm is the cause of the disease. I then wrote to Dr. Westeryk, Director of the Pathological Laboratory of Amsterdam, asking her to enlighten me on certain points in the investigation. In her reply she informed me that she was engaged upon the study of *Narcissus* bulb diseases in general, but that she thought eelworm was the most serious, although it had only been known in Holland for one year. Contributions from Dr. Westeryk have appeared in the Dutch trade paper. According to this author the disease which we attribute to Holland is ascribed by her to England.

The origin of the first outbreak of the disease in this country cannot be traced. Some growers say it came from Holland, others say from Guernsey, while there are others who maintain that the disease never appeared until new varieties were introduced in their collections. At first sight it certainly appears that the newer varieties are more addicted to the disease than the older ones. This may possibly, however, not be the case. If certain varieties prove to be immune we have a possible means of attacking the problem. Walder, Orton, and others in America have endeavoured successfully to breed varieties of cactus and other crops resistant to root-knot. If in a field of *Narcissus* badly infected with *Tylenchus* certain of the plants remain outstandingly free, it would probably pay to begin propagating bulbs by offsets from these plants.

The Discussion

The chairman (Mr. H. R. Darlington) stated that he had been experimenting with various chemicals that might generate a gas which would kill the disease. He had tried formalin, but this had too caustic an effect on plant life; in the case of Roses he found that formalin killed the plants entirely. Treatment with lime sulphur had yielded some success. He had soaked bulbs of *Wardale Perfection* Daffodil in this specific for half an hour on three or four consecutive days, and the bulbs were unharmed, and apparently cured. Soaking the bulbs for three months, however, killed them. He had left one in the solution for a week, which apparently cured it of disease, and did not seem to have done it any harm. He thought, however, that this method would only be effective in the case of bulbs only slightly affected with the disease. The real difficulty was to get rid of the disease from the soil; it seemed almost impossible to do this without at the same time killing the bulbs.

Mr. J. W. Barr thought it would be interesting to those present to hear that Miss Wel-ford, of the Royal College of Science, had been working on this disease of Daffodils, and that Professor Farmer had given him permission to read extracts from her notes. The conclusions of this investigator were that *Tylenchus* devastatrix was clearly the source of the disease. Both Miss Wel-ford's and his (Mr. Barr's) experience was that in the sheds where the bulbs were dried many of the mature insects emerged from the centre of the bulb, became dormant, and in this condition dropped from the bulb often on to a healthy bulb, thus infecting it if the condition were favourable. It was found that dry, cool conditions checked the spread of the disease.

Bulbs that were affected by disease began to grow earlier than healthy bulbs, and produced crinkled leaves.

Mr. Chittenden interposed with the remark that precocious flowering could not always be accepted as evidence of disease. Mr. Barr, continuing his remarks, advised the destruction of all diseased bulbs, no matter how valuable the variety, and said it would help to check the spread of eelworm if weeds were prevented from growing, as weeds were a source of infection. He had experimented in immersing the bulbs in water, which had given good results. The water was warmed to 110 Fahr., and the bulbs remained immersed for one hour. Another experimenter, Mr. J. C. Fryer, found that by the hot-water treatment all the eelworms were destroyed, and 30 to 90 per cent of the eelworm eggs. Another advantage was that the gnats of *Meloida* and *Humerus* flies were destroyed. His first experiment with heated water resulted in the bulbs throwing split flowers, but this year the bulbs had been cooled more gradually, on wood instead of on stone, with the result that none of the flowers had split.

Mr. Peter R. Barr stated that he believed that soaking the bulbs in hot water for one hour would destroy the *Tylenchus*. Last year his firm had removed every diseased-looking bulb from their Daffodil beds, and in cases of a few

were made had an influence on the health of the bulbs. He had seen a consignment of bulbs in which all the bulbs in cases made of a certain kind of wood were diseased, while all the rest, in cases of a different wood, were perfectly healthy.

The Rev. J. Jacob considered that the nature of the soil had a great deal to do with the question of disease. He thought that in cold, wet ground the spread of the disease was much more rapid and more certain. He planted a bed some 30 feet long in his own garden with *Narcissus*. The soil in the bed varied in different parts. One part was unmanured, another part had received a dressing of manure, while the remainder was peat with a damper bottom. The bulbs in the damp, peaty ground were badly affected with the disease, whereas those in the part which had been manured were very little affected, not so much as those in the unmanured part. This he considered was because the soil which had been dressed with manure was more open and in consequence drier and warmer. He thought also that it was quite possible to "over-protect" the bulbs and to lift them too often, which had the effect of weakening the stock.

Mr. W. B. Cranfield remarked that over propagation would not be likely to produce the disease, but it might render the plants more susceptible to attack. It was well known that certain varieties were more prone to attack than others.

Mr. Backhouse said that he had found eelworm in two-year old seedlings in the seed-pan. He drew attention to the fact that the older growers had noticed the discoloured tissues and irregular, dwarf growth mentioned by the lecturer in the variety *J. M. Camm*, but the disease did not then appear to spread.

Mr. W. Cuthbertson said that he grew a small collection of *Narcissus*, which was very successful until about two years ago, when he had introduced some of the newer varieties. Since then 90 per cent of the bulbs had failed. He considered that in his case the disease was introduced with the new bulbs.

Mr. Leek said that in his experience the older varieties were subject to the disease as never ones. In some cases, indeed, they were affected more severely. For instance, he found that bulbs of *St. Watkin* must be moved at least once in three years.

Mr. A. M. Wilson said that in the most highly cultivated and most richly manured garden he had ever seen the disease had never rotted an apple tree.

THE LATE SIR LEOPOLD DE ROTHSCHILD.

rate and in quantities where the offsets were found to be unhealthy, these were dipped in permanganate of potash and replanted, when upon they recovered and were showing healthy growth this season. With regard to soaking in hot water, he would recommend growers not to do this more than once in three years, as it gave a check to the bulbs. In reply to Mr. Jacob's question as to treatment of soil, Mr. Barr stated that nothing was done except to place lime in the holes where the diseased bulbs had been, as was practised in Holland. He said that in the old nursery at Surbiton they used to apply kaurit to the soil in August, when the *Tylenchus* is breeding. The best plan would be to sterilise the soil by heating, but this was too expensive for large areas.

Mr. Frank Law maintained that eelworm only attacked plants which were in feeble health. He considered that the disease was caused more often by wrong methods of culture than by eelworm. The *Narcissus* was "over-cultivated" and that was the cause of the newer varieties being the more susceptible to the disease. Growers who transplanted their bulbs every year predisposed them to the disease, as transplanting was unnatural, and led to the bulb becoming dried out. Bulbs growing in grass, which were left undisturbed for years, were usually perfectly healthy. He thought also that the material of which packing boxes

LEOPOLD DE ROTHSCHILD—It is with deep regret that we learn of the death, after an illness of six weeks, of Mr. Leopold de Rothschild, one of the most enthusiastic and discriminating of gardeners. Mr. Rothschild was devoted to the interests of Horticulture. In 1912 he acted as President of the Jury at the Royal International Show, was Vice-President of the Gardeners' Royal Benevolent Institution, and presided at the Festival Dinner in 1889, and again in 1915. He held a life office in connection with the Royal Gardeners' Orphan Fund, and, indeed, his generosity, on which there were many calls, was consistently devoted to the aid both of Horticulture and of gardeners. Not a few had, owe to his liberality their opportunity for making a start in life, and to this day are members of the source whence proceeded the help they received. The beautiful garden which Mr. Leopold established at Ascott has frequently been described in these pages. A perfect host, Mr. Rothschild took the keenest pleasure in showing his visitors round the garden and in explaining the stages by which he and his gardener had turned the countryside into a perfect garden, full of charming surprises and fine specimens of tree, and shrub, and flower, all so ably arranged as to give the greatest measure of diversity. In Gunnersbury House Gardens he took no less an interest, and the many successes of Mr. Hudson were always a source of the keenest pleasure to Mr. Leopold.

Obituary.

One of the most versatile of men, Mr. Rothschild knew how to win the hearts, not only of visitors, but of all those who worked for, or, as he preferred to call it, with him on his estates.

In the last months of his life Mr. de Rothschild threw himself with ardour into the work of increasing the production of vegetable food. With his experience and far-sightedness, he knew that the situation with respect to food supplies, with which this country is menaced had to be taken seriously, and that he might play his part in producing more food. He was prepared to convert the garden at Ascott and also that at Gomersbury into a market garden. As described recently in these pages, Roses in borders were replaced by vegetables, and the glasshouses converted into places for the intensive cultivation of food-yielding plants.

Of his many and great qualities, that which was most conspicuous was his simple kindness. He found the highest pleasure of which men are capable in love of friends and love of gardens, and his friends will always hold his name in high honour.

CROPS AND STOCK ON THE HOME FARM.

MANGOLDS.

It is important to keep Mangold plants free from weeds, and early and continuous stirring of the soil between the rows by horse or hand labour is imperative. The stirring of the soil about the plants admits air to the roots, and the resultant extra yield well repays any additional outlay in labour. Early thinning of the plants is also important. It is a mistake to delay the setting out of the plants after the second pair of leaves is formed. There is a difference of opinion among growers on the subject of the ground space required by the plants. Some consider that a medium-sized root, tolerably abundant, will yield the heaviest bulk of the finest quality; others say that extra large roots, obtained by allowing ample space to develop the leaves, yield the best results. In my opinion, however, the larger roots contain more water and less saccharine. The closest woody rings in the roots, the greater their value, as the sugar is stored mainly in these parts; therefore it may be assumed that the medium-sized roots are the more useful. The drills should be 20 inches apart and the plants thinned to 18 inches in the rows.

STIMULATING THE OAT CROP.

On p. 187 I advised the use of sulphate of ammonia for accelerating the growth and increasing the corn yield of this cereal. I note the President of the Board of Agriculture, p. 208, refers to the same subject. With a view of encouraging others who may be loth to make use of this stimulant, I will briefly give the result of an experiment I tried last year on a field of Oats. In the autumn of 1915 I ploughed and pressed 16 acres of an old Salford ley of fifteen years' existence, which was full of grass roots and a thick sward, just the home for wireworm. Early in March the plot was sown with Black Tartar Oats at the rate of 5 bushels per acre. Directly the Oat plant showed through the soil, I applied sulphate of ammonia (a little over 1 cwt. per acre), afterwards rolling the plot with a heavy ring roller. From the beginning the Oats grew luxuriantly, attaining the full height for the variety. The crop was not laid by storms of rain, but stood erect, ripened perfectly, and was safely stacked. Last week it was threshed, the yield being 80 bushels per acre. As the President of the Board of Agriculture remarks, it is not too late now to apply sulphate of ammonia to this crop. I am doing so on 20 acres as a fillip to growth of a rather weakly plant

CABBAGE.

The recent dry weather experienced in the South has retarded the germination of the Cabbage seed sown in April. To prevent an attack of Cabbage fly, and to stimulate the growth, dust

the plot with basic slag and superphosphate in equal quantities. The former is a fine powder, and will not only prevent the attacks of the fly, but will also mitigate any injurious effect the superphosphate might have on the leaves. It is liable to burn them during hot sunshine.

RAPE AND TURNIPS FOR SHEEP.

Sow at once Rape and early Turnips intended as food for sheep in August and September, to be fed off and followed with early-sown Wheat. Use two pounds of seed of Essex Branching Rape and one pound of seed of Beef Heart, commonly known as Lincoln Red, per acre. Devon Grey Stone, Red Globe, and White Pomeranian are all good Turnips for this purpose. The best method of sowing is by the Turnip drill, at the same time adding 3 cwt. superphosphate per acre, which gives a fillip to growth, and aids the Wheat crop also. Some sow the seed broadcast, but this method makes it difficult to free the plants from weeds.

WINTER SPINACH.

In view of the shortage of green vegetables in the garden and of roots on the farm during the past winter and early spring, it is remarkable how well Winter Spinach has withstood the cold. I do not see why this vegetable should not become one of the regular farm crops. I made a small experiment last autumn which augurs well for future success. Many fail with Winter Spinach by sowing too late, which does not allow the plants to get established before autumn rain and frost check the growth. By the end of August all the seed should be sown in drills 18 inches apart, which will allow for surface stirring of the soil in the autumn. Deeply worked, fairly heavy, dry soil, well enriched by a dressing of farmyard manure, suits Spinach to perfection. I grow the ordinary round and prickly variety. Since the end of March I have regularly picked large quantities of succulent leaves. There is still a promise of further supplies for some time to come. *E. Molynour*

BAMBOO IN FLOWER. *W. H.* The scrap of material you send is not sufficient for the species to be identified with certainty. It is a species of *Arundinaria*—most probably *A. Falconeri*. The flowering stems are better cut off as soon as any indication of their nature is perceptible. It is the only method of saving the lives of some Bamboos when they flower.

BANANAS. *A. W.* The fruits will be of superior flavour if they are allowed to ripen on the plants.

BEANS DISEASED. *G. B. H.* The Beans have a bacterial disease in the stem at the level of the ground; the affected plants should be destroyed.

FATSIA JAPONICA (ARALIA SIEBOLDII) DYING. *M. and Co.* The foliage has the appearance of having died very suddenly, and the injury may have been caused, as you suggest, by lightning. We notice, however, that the stems of the shoots are completely denuded of bark. Such a condition, though it would not cause the sudden death of the foliage, would certainly cause it to wilt and turn black in a comparatively short time. The destruction of the bark may have been caused by some gnawing insect or animal.

GARDENER'S CHARACTER. *Surprised.* We do not think that any redress is possible. The head gardener on leaving your service gave a statement to each of those who had served under his direction to the effect that the services rendered had satisfied him. This is not surprising when it is remembered that under gardeners almost invariably obtain their testimonials from their professional chief, rarely troubling the employer in the matter.

monials from their professional chief, rarely troubling the employer in the matter.

MARKET GARDENING. *J. P. B.* A reasonable salary to a good man would be 30s. per week, with house and fuel, and a commission of 5 per cent. on all sales. You should grow as many Tomatoes as possible instead of the Melons, Ornaments, and stove plants you now cultivate. Pay special attention to the Peaches, especially if they are late varieties. All out door fruit, especially Black Currants, will be in demand, and so will all kinds of choice vegetables and salads. In calculating the profit the upkeep of the glasshouses, such as painting, repairs, tools and manure must be taken into consideration. To keep poultry on a small scale would be an advantage, as from such a garden as yours much surplus green food would be obtainable at nominal cost. With reference to the grassland, you do not state whether your tenant has a legal right to sublet it. If not, you should instruct your solicitor to prevent the sub-tenant from entering into possession or cutting the grass. If, however, the agreement with your tenant does not stipulate that there shall be no subletting we fear you have no legal remedy.

NAMES OF PLANTS. *A. B. H.* *Allium paradoxum*—*J. G. S.* 1. *Kerria japonica*; 2. *Spiraea prunifolia* var. *flore pleno*; 3. *Coronilla Emursii*; 4. *Exochorda Albertii*; 5. *Lonicera involucrata*; 6. *Cornus sanguinea*; 7. *Spiraea bracteata*; 8. *S. hypericifolia*—*Shropshire*. *Staphylea pinnata*.

OVERTIME PAYMENT. *M. Y. C.* There is no rule as regards payment for overtime in gardens, unless a stipulation on the subject is made at the time when a gardener is engaged.

PLAN OF A TENNIS COURT AND CROQUET LAWN. *M. G.* A plan of a tennis court, with details for making it, was published in the issue for July 22, 1916, and for a croquet lawn in the issue for April 1, 1916. These back numbers are obtainable from our publishing department.

POTATO DISEASED. *G. H.* The Potato has the fungus *Rhizoctonia* on it. This disease seldom does any serious injury to the growing plant.

PROPAGATING LILACS. *R. A. Leyton.* You can propagate the Lilac from cuttings inserted now in sand, and rooted in a close frame with a bottom heat of 60° to 65°. If you have no bottom heat at command the cuttings may be rooted under a hand-lid in a shady spot outdoors, but the former method is the more successful. Choose as cuttings the young growing shoots, pulling each off with a heel, and merely trimming away the lower leaves. They should root in from six to eight weeks with a steady bottom heat, but may be expected to take at least three months out of doors.

TOMATO DISEASED. *B. J.* The Tomatoes are attacked by a disease known as black rot, or Macrosporium Tomato. The fungus probably gains access to the fruit by means of minute cracks or punctures in the skin. You should remove and burn all affected fruits, and spray the plants occasionally with potassium sulphide. Be careful to ventilate the houses thoroughly, and prevent an excess of moisture in the air. Do not use too much green manure, as this causes the fruits to crack. You should not use the soil from the Tomato house for planting Potatoes, as the disease can also attack Potatoes, and is very infectious.

WEEP ON A LAWN. *D. G. P.* The plant is one of the foliaceous Lichens, and is an indication of a very damp soil. The lawn should be drained and the turf dressed with nitrogenous manure, such as nitrate of soda or sulphate of ammonia, to stimulate the growth of the grasses.

MARKETS.

COVENT GARDEN, W.C. 2.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots such as Aralia Sieboldii, Asparagus plumosus nanus, and various ferns with their prices per dozen.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers such as Arums, Carnations, and various orchids with their prices per dozen.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage such as Adiantum (Maidenhair Fern), Asparagus plumosus, and various ferns.

REMARKS: Consignments of cut flower from Guernsey and Seilly are showing the effect of the long journey in warm weather, and many boxes of Gladioli...

double white Narcissus, King and his are almost unobtainable when they reach the market. Home-grown double white Narcissus is selling freely. Double white Stock is now in plentiful supply but soon bought up. Many enquiries are being made for double white Pinks, but the first consignments of which are expected to reach the market this week. Single variegated colored, are on sale. Iceland Poppies are selling freely. Iris and Gladioli are scarce this week. All Pinks are finishing to the season, the blooms will not stand the journey in warm weather. Carnations advanced in price during last week-end. There was a good demand on Saturday for scarlet and white flowers for the Whitsun holiday, but the market being supplied with flowers on Saturday morning. Roses are much smaller. Liberty, Miss Abel Chateaux, and other Mrs. Sherman flowers are most in demand. A few packages of marse, satins and Paonies are arriving from France this week.

Vegetables: Average Wholesale Prices.

Table listing vegetables such as Artichokes, Asparagus, Beans, Beetroot, Broccoli, Cauliflowers, Carrots, Cabbages, Cucumbers, Endive, Greens, Garlic, Herbs, Kale, and Leeks.

Fruit: Average Wholesale Prices.

Table listing fruits such as Almonds, Apples, Bananas, Raspberries, Dates, Gooseberries, Grapes, and Walnuts.

Remarks: There are now no Apples available, the market being now completely cleared. Supplies of grapes from Blandford and Marlborough, Alexandria and other places are good. Peaches, Nectarines, and other fruit, and softening colored Strawberries are all in plentiful supply. Larger supplies of green Gooseberries are reaching the market. The bulk of Aparagus is now in the market in fine condition. The first consignment of home-grown fresh strawberries, which have been grown in the Channel Islands, are in the market in good condition. Peas, Beans, and New Potatoes are all in the market in good condition. Cauliflowers are in plentiful supply and at this season of the year. Lettuce, both Cabbage and Co. are scarce and dear. A consignment of South African Potatoes, consisting of the following varieties, is expected to reach the market, viz., King of the Mountains, and Paonies.

GARDENING APPOINTMENT.

Mr Arthur Freshwater, a Gardener to Lady Kinnaird, writes: HERBIC, Bean Manse, Lough brought to me yesterday.

THE ROCK GARDEN

A practical work on the cultivation and management of Rock Gardens, written by Reginald Farrer. One of the best and most popular works on the subject. Price 1/10 post free. THE PUBLISHER, The Gardeners' Chronicle, Ltd., 41, Wellington Street, Covent Garden, London, W.C. 2.

THE ONLY DIRECTORY OF GARDENS AND GARDENERS.

The Horticultural Directory and Year Book for 1917 is the ONLY Directory that exists of gardens and gardeners in the British Isles.

If you want a list of all Nurseriesmen and Seedsmen, Sundriesmen, Hot-house Builders and other traders closely connected with horticulture, consult the ONLY Horticultural Directory.

Should I you desire to trace the whereabouts of the young men you associated with in the Botchy you have no other means of finding out their present addresses than by turning to the ONLY Directory of British Gardeners.

Obtain a copy and see if your own name is there, and if it is not, then send us particulars for inclusion in the edition for 1918.

The Year Book part of this unique volume contains descriptions of all the new plants, flowers and fruits certified in 1916, notes on the principal gardeners who died during that period, and much additional information of great value to all amateur and professional horticulturists.

We are still able to offer some few copies of the current number. Readers are advised to send their orders early, before the work is out of print.

Apply, enclosing 1/4 for each copy required, to:—

GARDENERS' CHRONICLE, LTD., 41, WELLINGTON ST., COVENT GARDEN, LONDON, W.C. 2.

BUSINESS METHODS. Experience in the world of commerce shows that there are two ways of conducting a business, the one being to charge as much as possible for what is sold, exacting a high rate from one customer and a low price from another and the other to have a fixed price for everything and stick to it. The first method is to be condemned from every point of view, but mainly because it punishes the best purchasers, those who are ready to pay what is reasonably a fair price when the goods are marked in plain figures. The "Gardeners' Chronicle" adopts the alternative. It guarantees that its advertisement rates are not added for any customer, big or little, old or new, all pay the same price for a similar thing. Consequently, while it is not possible to grant concessions, it nevertheless the privilege of the paper to be in the position to assure each advertiser that he pays no more than any one else.

GARDEN ENGINE; strongly made steel cylinder, 2 1/2 inch and 3 1/2 inch inside and outside, portable, 100 lbs pump, on wheels, 12 gallons. E. BARD, 158-20, Warren Road, High Barnet, Herts.

PUBLISHERS' NOTICE.

JOHNSON'S GARDENER'S DICTIONARY:

Entirely re-written and brought down to date by W. HEMSLEY and J. FRASER, 932 pp., royal 8vo. 12s. net.

Since its first publication in 1846, there have been several revisions of this standard work, on which most of our leading gardeners have been brought up. The present revision is a wholesale re-creating, based wholly on original work, of the 1863 edition, the main outlines of which have been preserved, tho' many improvements both in scope and in method have been introduced. It will doubtless again take rank as the book for the serious gardener, professional or amateur.

GEORGE ROUTLEDGE & SONS, LTD.,
68-74, CARTER LANE, E.C.

SALE OF

Ker's Famous Aigburth Amaryllis

(R. P. Ker & Sons, Aigburth, Liverpool)

This strain of Amaryllis (*Hippeastrum*) has won First Class Honours wherever exhibited. The total honours awarded exceed the total of those given to all other strains in the whole of Europe.

44 Gold Medals and numerous other Premier Awards made at the most notable exhibitions in

- London.
- Petrograd.
- Brussels.
- Antwerp.
- Ghent.

prove this strain to be one of unparalleled excellence.

The buyer of this strain will inherit not

only the existing medals, &c., but the far more valuable Premier Position as owner of the finest race of flowers extant.

The buyer will receive, in addition to the magnificent stock of nearly 13,000 bulbs, and many thousands of seedlings, the Priceless Pedigree records which have been assiduously kept by Mr. F. Ker. These records are of inestimable value as a guide to future hybridisation, as well as to the influence of the different species, varieties and forms upon actual results.

The present status of the Amaryllis, important as it is, is only of small account compared with the brilliant future ahead.

The Stock is in a perfectly healthy condition, and consists of at least

- 620 large named flowered bu'bs.
 - 2,350 10 flowering bulbs, 3½ and 4½ years' old.
 - 7,400 2½ to 3½ year old bulbs.
 - 2,350 1½ to 2½
- and a huge quantity of seedlings.

95 per cent. of the entire stock is accurately labelled with parentage to correspond with stock book.

Offers are invited by the Trustee for the whole or part of the stock. Arrangements can be made for attention until growth is finished, and the bulbs are ripened and dry ready for shipment.

This advertisement will appear almost simultaneously in the American and the English Press.

Offers are to be made to the Trustee:

Harold Sadler, Esq. (Messrs. Finney, Son & Sadler), 31, North John Street, Liverpool

WANTED, TWO WOMEN GARDENERS, one able to do Making. Apply, W. J. POTTS, Handfield, Sutton at Home, Kent.

THE MARKET FRUIT GARDEN.

It is some years since we have enjoyed a May as sunny and warm as the past month, although the wind was in a cold quarter for half the time, when prevented growth from being as rapid as it might have been. There was not a single frost 4 feet above the ground level at my station, and the nights lost their coldness in the latter part of the month. Rain was measurable on only ten days, making a total of 1.50 inch. Absolute drought prevailed until the 13th, and only one shower of a few minutes' duration occurred after the 23rd, the thunder storms of the last week having missed my district. The dry periods were beneficial for killing weeds by horse cultivation and hoeing. Gardens in which Lilac, Pink May, Laburnum, and Guilder Rose are growing in juxtaposition were very beautiful at the end of the month, as the rare spectacle of all four in blossom at the same time was presented, though Lilac blossom was past its prime.

A PLAGUE OF CATERPILLARS.

Just before the petals of Apple blossom began to drop, the outlook for Apples and Plums was extremely promising, and with respect to Apples particularly, it seemed that nothing was at all likely to occur to prevent the production of a bumper crop. In a little more than a week, however, a lamentable transformation scene was developed, the result of the most tremendous infestation of caterpillars that I have known in my seventeen years' residence in my present home. On many varieties the trusses of blossom had turned brown, as if they had been killed by frost, of which there was none at my place after the blossom had opened, while the foliage was riddled with holes. The attack varies in intensity in different orchards, and among the several varieties in the same orchard. The difference, however, is only one of degree, ranging from slight injury at present apparent to the almost total destruction of the crop and very serious injury to the foliage. Where arsenate of lead cannot be safely applied, in consequence of Black Currants growing under the trees, the damage cannot fail to be increased before the pests have finished their larval stage. The misfortune is all the more impressive to me from the fact that it is a novelty in my ex-

perience in my present place, this being the first time of serious damage to my Apple crop having been done by caterpillars, though it has suffered some injury, particularly from the Apple sawfly

sent season. To me it appears criminal to spray with rank poison trees growing over Currants which will be marketed in about four weeks, and in the case of Gooseberries the danger is much greater if they are to be sold while green.

VARIATIONS IN INJURY.

Among the most seriously damaged Apples are Cox's Orange Pippin and Allington Pippin planted in the autumn of 1906. Nearly every truss of blossom on these trees is withered, and comes off entire when a hand is passed up it. On May 30 it was found that there was, or had been, as obvious from traces, a caterpillar in nearly every truss. Probably some growers will charge the Apple sucker with this destruction, but not more than two or three out of some of cases examined with a lens contained a sucker or any trace of one. In an orchard planted in the autumn of 1900 some finely grown Allingtons have had their crop almost entirely destroyed, while trees of the same variety planted sixteen years from last autumn have set a good crop. The like contrast holds good with Blenheim Pippin in the two orchards. Mr. Gladstone has experienced damage almost entirely in three, and Beauty of Bath in three, while badly injured in a fourth orchard. Worcester Pearmain varies greatly in degree of injury; although all the trees have been badly infested, mature trees of robust growth have set a good crop, while some younger trees which have never been heavily will be almost devoid of fruit. Mature trees of Bramley's Seedling have not been much damaged, but on younger trees, even where a fair quantity of blossom has set, a very large proportion of the fruitlets have surface holes eaten in them. Queen, Lord Grosvenor, and Royal Jubilee show no injury to fruit at present, though Lord Grosvenor has its foliage much eaten in one orchard. Duchess of Oldenburg trees, ten years from the planting, have their blossoms almost entirely destroyed, while mature trees of the same variety have hardly been touched. Lane's Prince Albert has been injured in varying degrees. Chesham Wonder, of which I have only a few trees, is in the worst condition of any mature variety, its crop being destroyed and its foliage in ribbons. Excepting one lot of trees already mentioned, which have never been healthy, Cox's Orange Pippin has been injured less than many more robust varieties. James Grieve has had more harm done to foliage than to fruit.

TOO MUCH BLOSSOM

Apart from the attack of caterpillars, there must have been a considerable proportion of abortive trusses of blossom, as it was so superabundant that it could not be nearly all fertilised, nor was it desirable that it should be. But it is to caterpillar attack that the failure to set on some large groups of trees is traceable.

Reference to the loss of blossom through caterpillar attack does not cover all the injury done thereby, for, among the Apples set there is a very large proportion with surface holes eaten in them. This statement applies to almost all the varieties badly attacked.

VARIETIES OF CATERPILLARS.

The number of varieties is considerable, and it includes some not familiar to me. The proportion of Winter Moth larvae (see fig. 37) is smaller than I expected to find, while there are hardly any hairy caterpillars of any kind in the collections obtained by shaking branches over an inverted umbrella, and practically no Apple Sawfly maggots. Mr. Theobald, who has kindly reported on two collections sent to him, names the so-called Common Tissue Moth (*Notosa dubitata*) larvae as numerous in a lot from Blenheim Pippin, and remarks that they are uncommon, none having ever been sent to him before. Other varieties named by him

FIG. 34. MOTTLED UMBER MOTH.

larvae. Curiously enough, this particular pest may almost be said to be conspicuous by its absence this season.

With respect to Plums, the infestation is worst

FIG. 35. ERMINE APPLE MOTH.

in young trees, with abundant traces of a few good and tender foliage now eaten into ribbons. The blossom on Plums had set remarkably well, and on comparatively all trees the injury

FIG. 36. BRINDLED BEAUTY MOTH.

to foliage is not much worse than I have had it before, so that the crop may not be greatly reduced, but young trees will not bear out their blossoming promise. As the young trees are

FIG. 37. THE WINTER MOTH.

in an orchard where there is a bottom crop of Black Currants, they cannot be sprayed with arsenate of lead, and the injury to them will not be limited to the mischief done in the pre-

are the larvae of the pale Brindled Beauty (see fig. 86), Winter (see fig. 87), Clouded Drab, and Mottled Umber moths (see fig. 84), while one large looper requires time for identification. Here and there I find tents of the Lackey and Little Ermine moths (see fig. 85), but the caterpillars of these varieties were too small when taken to have done any material damage.

WHEN TO SPRAY AGAINST CATERPILLARS.

It has been generally agreed that the time to apply arsenate of lead for the poisoning of caterpillars is immediately after the petals of the blossom have fallen. But is that soon enough? A negative reply to this question seems to be indicated by the circumstances of the present season, for, by the time named, a vast amount of irreparable damage had been done. Even if the trees first sprayed are saved from serious injury, beginning, of course, with varieties soonest off blossom, increasing damage must be done before the operation is finished, even when continuous fine weather allows of steady progress in the work, while the case is much worse when spraying is interrupted by a few rainy days. Yet the spraying cannot be done while the blossom is open, because the result would be the poisoning of bees and other pollinating insects. It may be suggested, then, that the arsenate of lead should be applied shortly before the blossoms open, when the clusters of blossom buds have just emerged from their sheathe, which is now admitted to be the best time for what is known as "winter spraying." In other words, the arsenate of lead should be mixed with the lime-sulphur, or lime alone used for that operation. It may be objected that this implies the use of the poison on all varieties of Apples without knowing whether they will be seriously attacked by caterpillars or not, but probably half the usual proportion of arsenate of lead would suffice to kill larvae just hatched as soon as they begin to feed, and 2s. or less per hundred gallons of wash would not be a heavy addition to the expense of the first spraying of the season, while there are always more or less caterpillars on Apple trees. It is true that the suggested application of the poison would be too early for the destruction of the Codlin Moth larvae, and that a second spraying for them specially would be needed where these pests are common, unless it happened to be deemed desirable to spray against aphid and Apple sucker just after the fall of the blossom, in which case the poison could be added to the contact wash. The suggestion is not applicable to Plums, because there is nothing for the poison to lodge upon until the blossom is at least partially open. Unless I am mistaken, caterpillar attacks on Apples usually begin in the bottom trusses and among the tender foliage around them, while on Plums they are mainly confined to the foliage.

DESTRUCTION BY BROWN ROT.

This serious disease has had its part, as was the case last year, in the destruction of whole trusses of Apple blossom. Lord Derby, Cox's Orange Pippin, Fearn's Pippin, Lane's Prince Albert, Early Julyan, and Domino are most affected. Trusses of blossom killed by this fungus are easily distinguished from those which have simply faded from lack of pollination or vigour of a tree to set superabundant blossom, as the spurs are found to be rotten nearly or quite down to their junctions with a branch. Unless these spurs are cut out cleanly, each one will cause a brown rot canker. They should be removed and burnt promptly. James Grieve is a variety particularly liable to lose main branches from brown rot canker. I have some finely grown young trees of this variety which need pruning a second time this season for the removal of main branches killed by this disease. *Southern Grower*.

ORCHID NOTES AND CLEANINGS.

CHYSIS BRACESCENS.

THIS fine old Mexican species now seldom seen in good condition, is making an attractive display in the nurseries of Messrs. J. Cypher and Sons, Cheltenham, where a dozen specimens are producing their stout spikes of white wax-like flowers, each three inches across and well arranged beneath their arching, leafy pseudobulbs. A group of finely-coloured Cattleya Mossiae, with several specimens of the white-variety, Wagoner; some good emerald-green and white Cypripedium callosum Sandrae, and others of the class; a fine lot of Odontoglossum citreum, and brilliant scarlet and mauve Maslevallias, with Dendrobium Dalhousie and other Dendrobiums, are also arranged with the Chysis Bracescens.

EPIDENDRUMS AT CHELTENHAM.

THE reed-stemmed decorative Epidendrums are said to be in flower more or less all the year round. Some of the specimens at Messrs. Cypher's bearing trusses of yellow, red, and crimson flowers, have been in flower for over eight months, fresh buds expanding as the older blooms pass off. Epidendrum gattoense (Bonndii x xanthinum), of which there are twenty plants in bloom, is the favourite on account of its neat habit and compact spike. E. O'Brienianum, the eldest of the class, with flowers varying from rosy-purple to crimson, is still one of the most effective. The species from which these and other hybrids of the class were obtained—E. radicans (dark scarlet), and the lighter Bletchley Park variety; E. evectum, light purple; the dark red E. Schomburgkii; and the pale yellow E. xanthinum—are also in bloom. These Epidendrums are most useful for decorative and conservatory work, and they are easy to propagate by cuttings from the reed-like stems.

BRASSOLAELIO-CATTELEYA ADMIRAL SIMS.

A FLOWER of a new hybrid between Brassolaelia Digbyana-Mossiae and Laelia Cattleya St. Gothard (L. C. Gattoiana x C. Hardyana) is sent by Messrs. Sander and Sons, who have flowered it for the first time. The flower, which is seven inches across, with petals two and a half inches wide, has deep rosy-mauve sepals and petals. The silver-white ground shows through in the veining and on the mid ribs. The lip is well formed, three inches across, and is coloured like the petals at the base. The front lobe and the edges of the side lobes are crimped and very slightly fringed. The colour is dark reddish-purple, with yellow veining running from the base to the darker yellow disc.

TREES AND SHRUBS.

RIBES ALPINUM AUREUM

A BUSH of Ribes alpinum aureum that has never fruited with me before, is this season covered with small fruits. Mr. Bean, in *Trees and Shrubs*, states that the two sexes are usually represented on different plants. I am not aware whether the golden-leaved variety is supposed to be a male or female variety. I have a green-leaved bush of R. alpinum which carries, I believe, only male flowers, but this is nearly two hundred yards from the golden-leaved plant now in berry. Mr. Bean also states that occasionally there are perfect flowers formed. Is it possible that something in the season has so affected the bush as to induce it to produce perfect flowers throughout? *C. E. Fletcher, Yalding, Kent*.

CRUSOE'S ISLAND: JUAN FERNANDEZ.

(Continued from p. 221.)

IN March, 1817, the Spaniards ceased to hold possession of Juan Fernandez of the establishment of the independence of Chile. The Chilean patriots, who had suffered many indignities, were liberated by an intrepid Englishman, Captain Morris, at the instance of General O'Higgins, who had been proclaimed Supreme Director of the Republic. The colony was retained as a depot for State prisoners until 1821, when an insurrection took place, which obliged the Government to abandon the establishment. During the next few years it was farmed by two Chileans, who kept a few men to take care of the cattle and collect sandal wood.

Mrs. Maria Graham, wife of Admiral Graham (afterwards Lady Callcott) in her *Journal of a Residence in Chile* (1824), gives an interesting account of her visit to Juan Fernandez in 1822. Mrs. Graham, who became an authoress of some repute, had a keen interest in all things pertaining to natural history. She describes the island as the most picturesque she had ever seen, with its "high perpendicular rocks wooded nearly to the top, and beautiful valleys." In the half ruined hedges she found Apple, Pear, and Quince trees, with Cherries almost ripe. In her charming style Mrs. Graham describes how she remained behind when the rest of the party set off to reach the highest point, in order to be alone and soliloquise on her surroundings as "Monarch of all she surveyed." After some hours in a "lonely spot, where "no trace of man could be seen, and whence I seemed to have no communication with any living thing," she very soon felt, in the words of Cowper,

"Oh, solitude! where are thy charms

That sages have seen in thy face?

Better dwell in the midst of alarms,

Than reign in this horrible place";

although the place, on her own showing, was evidently not so horrible as the poet would have one believe. And she repeated again and again the whole of the poem, until she saw two of her companions of the morning coming down the hill, when she hurried to meet them, as if she had been really "out of humanity's reach." Her friends were enraptured with the wild beauty of the scenery, and brought her specimens of many beautiful shrubs, the giant Fuchsia, *Andromeda* (*Pernettya rigida*) and *Myrtles* (no doubt *Myrtus fernandeziana* and *Myrtus Selkirkii*). In one of the caverns they found an enormous goat dead, which, of course, reminded them of "poor Robinson Crusoe."

In 1835 the island was governed by Mr. T. Sutcliffe, an Englishman in the Chilean service. His trials and troubles are recorded in a pamphlet, entitled "The Earthquake of Juan Fernandez as it occurred in the year 1835; authenticated by the retired Governor of that island." On the night of February 19 a strange rumbling noise was heard, and the next day it was observed that the sea, although at the time low tide, had risen nearly over the mole. The Governor became alarmed, especially as the sea began to retire quickly, leaving the greater part of the bay dry. He ordered the drummer to beat to arms, and the alarm bell to be rung. When the people were collected he directed them to lift the boats and carry them inland. In order to animate them he led them from behind, which, in this case, was the post of danger. Then the earth began to shake violently, and a tremendous explosion was heard, whilst the sea receded in immense rollers. The convicts became so frightened that they abandoned two of the boats; all was confusion, the people screaming and making dismal cries as they climbed the hills. The soldiers had barely time to save their arms before the settlement was covered with water, which, receding again, carried away houses, several men

and women, trees and cattle, leaving only the store-house, prison, and church standing. One of the boats was launched by the Governor, and he managed to save the men and women who had supported themselves in the water on floating timber. The unfortunate Governor lost nearly everything. All the ammunition was ruined except a few cartridges in the possession of the soldiers. The town and gardens were buried in sand, and the mole and watering place destroyed. The officers and troops took refuge for the night in the caves which had formerly been the dwelling places of the convicts, the latter remaining at large.

In July of the same year an insurrection broke out. The convicts gained possession of the castle and were afterwards joined by many of the soldiers and officers, who, unfortunately for the governor, had sympathy with the rebels. The castle was stormed by the gallant governor and a few soldiers and convicts who had remained faithful to him. They killed two, wounded six, and took fourteen prisoners, the rest escaping with their firearms to the mountains. Three of the prisoners were summarily shot as an example to the other mutineers. During the parley between the renegade commandant of the troops and the governor, the latter was treacherously taken prisoner, and was eventually expelled from the island by the mutineers. The convict station was soon afterwards transferred to the main land.

In 1866 H.M.S. "Topaze" visited the island and Commodore Powell placed a tablet near "Selkirk's lookout," a high point from which both sides of the island can be seen. The tablet bears the following inscription:

In Memory of

ALEXANDER SELKIRK, Mariner.

A native of Largo in the County of Fife, Scotland, who was on this island in complete solitude for four years and four months.

He was landed from the "Cinque Ports" galley 96 tons, 16 guns, A.D. 1704, and was taken off in the "Duke" privateer, 12 February 1709.

He died Lieutenant of the "Weymouth," A.D. 1725, aged 47 years.

This tablet is erected near Selkirk's look out by Commodore Powell and Officers of H.M.S. "Topaze," A.D. 1866.

In the spring of 1875 the "Challenger" expedition visited the islands, when Moseley, the naturalist, made a very complete and interesting collection of the native plants, which are preserved in the Kew Herbarium. Some of his observations have already been alluded to.

Carl Skottsberg, an able and energetic Swedish botanist, visited Juan Fernandez in August, 1907.

In his book on *The Wilds of Patagonia*, which is appropriately dedicated to the late Sir Joseph Hooker, it is pleasant to read in the preface that

"In Chile, as well as in Argentina, we met and were assisted by a great number of English people; we made good friends wherever we came, and learnt to admire the English nation as *the great civilising power of the world*." His impressions on landing on the island are equally well worth reproducing, not only because of their interest, but also that they prove the Swedes to be as well acquainted with *Robinson Crusoe* as we are.

"We set our foot on the shore of a legendary island. Dear reader, do you remember how the wonderful fortunes and adventures of Robinson Crusoe interested you, when you were a small boy or girl, and went to the infant school? Did you not dream that it rained drops 'large as pigeons' eggs,' or that you discovered on the sandy sea shore those footprints making your blood curdle with terror?"

And I was seized by a feeling of pure joy when I thought that I was really here, walking about on that soil, and able to live through the favourite book of early childhood again."

The island is of volcanic origin, and is about 13 miles long and a little over 4 in breadth. Moseley says it is most beautiful in appearance, the dark basaltic cliffs contrasting with the

bright yellow green of the abundant verdure. The land terminates in fantastic peaks, which rise to a height of about 5,000 feet. Especially conspicuous is the precipitous mass known as "El Yunque" (Spanish for The Anvil), see fig. 38, which forms the background of the view from Cumberland Bay. *J. Hutchinson, Kew.*

To be concluded.

ON INCREASED FOOD PRODUCTION.

FRUIT PRESERVING WITHOUT SUGAR.

REFERRING to the article written by *Southern Grower*, see p. 212, where he states that without the use of sugar "it is probable that half the Plum crop will be wasted." I may say that Plums can be bottled without sugar, when fully grown and beginning to colour, by putting them into open-mouthed bottles with a teaspoonful of hot water, placing them in a slow oven, and gently cooking them till they shrivel in the bottles. Have ready some bladder that has been soaking in hot water. One bottle at a time should be

filled with fruit and spring. It is much smaller than the Butter or Haricot Bean, but the flavour is excellent. *J. J. S.*

PLANTING POTATOS.

THE planting of Potatos is practically finished for the season, but it will be well for growers to make a careful study as to the results from the various methods of planting in their particular localities. I am still firmly of the opinion that varieties and the nature of the soil should, to a large extent, be the governing factors as to the distance to plant.

If it is the opinion of Mr. Divers that the result of the heavy crop of Evergood was owing to the fact that the long growth was the means of holding the haulm erect, why should this not also apply to other varieties making much less growth, such, for instance, as Factor, a variety he mentions, when planted closer together? It would be interesting to know what kinds of manure Mr. Divers employed, and how many acres of Evergood were grown. Anyone who has had experience with this variety must be aware that it is one of the heaviest cropping Potatos, and is seldom attacked by disease, but

FIG. 38. THE MOUNTAINS, JUAN FERNANDEZ, SHOWING THE PEAK KNOWN AS "EL YUNQUE" ("THE ANVIL").

taken from the oven, and immediately filled with boiling water poured through a funnel, the bladder placed in it once, and put down with string, extending all round. Last year all my Plums were treated in this way, and after being kept on a dry, airy shelf for nine months they were excellent, and the flavour better than that of fresh fruit, as the kernels had imparted a taste of Almonds. The fruit can be eaten as a compote, and sweetened with golden syrup, honey, or dates, or made into jam. If sugar should apply to *Cross-berries*, Black and Red Currants, and Peas, the latter peeled and cut into quarters.

Fruits that are not quite ripe are best for bottling. *Food Economist*.

BUTTER BEANS

MR. BICKETT, on p. 212, recommends such Dwarf Beans as *Magnium Bonum* and *Canadian Wonder* as being equal, if not superior, to the *Lima Bean* in flavour, but, seeing the skins of these require to be removed after cooking (surely a tedious process), why not grow a dwarf Bean like *Everbearing*? This is a small white variety which may be cooked exactly in the same way as the *Butter Bean*, and it may be used through

out quality, on the majority of soils, of little value. His reasons for allowing the same distance for early varieties could surely not apply to the *Factor* and many other mid-season and late varieties, which vary considerably as to the length of their growth.

My experience has always been that the more growth a particular variety of Potato makes, the more room it requires, and the better the returns. Also, the quantity of tubers required to plant a large area of ground where close planting is adopted is an important item. *E. Bickett*.

MR. DIVERS' assumption (p. 222) that "widely set Potatos have a tendency to 'fall down flat'" is surely more theory. I allow a space of 3 feet by 1 1/2 foot for the variety *Golden Wonder*, and have no recollection of the tops ever falling, and they grow much more than 3 feet high. This year I am allowing *Arran Chief* less space because the tubers, in conditions where space is given for the haulm to extend, grow far too large for use, and possibly other varieties may have to be treated according to their peculiarities. Whenever I have been told that *Golden Wonder* has failed to give satisfaction I have found that the tubers have been planted too closely. I find it by far the best Potato I have

ever grown. The eating qualities of Golden Wonder are just as good now as they were in September last, and they will continue equally good for a long time to come. But it is not Potatoes only that are grown too thickly. Broad and French Beans are commonly planted far too closely. This entails a waste of seed, for neither need ultimately be closer in rows than 18 inches, and by seeding at half that distance every probability of loss from bad seed is guarded against, whilst the crop is not only as large as in close seeding, but the plants continue longer in bearing and produce Beans of better quality. *R. P. Brotherton, Tynningham Gardens, Prestonpark.*

PLANTING BROCCOLI.

I HAVE had experience with Broccoli similar to that related by Mr. Coulmer, on p. 221, in a northern county on the outlying spurs of the Grampians. The garden was situated on a steep slope, with a stream running through the lower end of the ground. On the higher reaches of the garden the Broccoli came through the winter safely, especially when the plants were half-wooded with the fork and laid on their sides in autumn to check growth. One year a plantation of several hundreds was made on the lower half of the slope. The following winter happened to be a severe one, with much snow, commencing in November, and continuing more or less till the third week of April. The snow continued in an unbroken sheet on the lower slopes for four months, and every plant of Broccoli had completely rotted when the snow melted. Repeated partial thaws kept the plants wet, and to this, as well as to the frost, I attribute the loss of the crop. Elevated positions and firm soils contribute to the safety of this crop. *J. F.*

THE DESTRUCTION OF WASPS.

THE capture of queen wasps in the spring is very desirable, and is encouraged in many districts by the offer of a small reward. Traps (such as jars or bottles containing beer or sugar) which are often used later in the season against worker wasps, when used in spring account for a large number of queens.

Nests should be marked down as soon as possible and dealt with before they have become too strong. Various means are employed for taking nests on the ground, such as burning or smothering them with tar, paraffin, or sulphur. In many districts potassium or sodium cyanide is used most effectively. However, the supply of cyanide this year is very uncertain, whilst the price is sure to be high. Where cyanide can be obtained, its use is the best and simplest method for destroying wasps. A little cyanide is placed inside the entrance to the nest after the wasps have returned in the evening. The hole is then blocked, and further trouble is seldom experienced, although, to make sure, the nest is sometimes dug out after the adult wasps have been killed. It must not be forgotten that cyanide is a deadly poison, and great care must be exercised when handling it.

BOTTLES FOR PRESERVING FRUIT AND VEGETABLES.

THE Food Production Department has arranged with the Ministry of Munitions of War to supply glass jars for preserving fruit and vegetables. The price of the bottles is 52s. per gross, delivered to the nearest railway station. Orders must be for not less than 100 dozen (which cost £24 15s. 4d.), and preferably for 300 dozen (one truckload, which costs £36 15s. 4d.). The requirements of every district must be ascertained by a responsible authority and submitted collectively. Only one order can be accepted from a locality; the orders of private individuals cannot be accepted. The Department will shortly be in a position to meet demands to the extent of 2,000 gross jars per week. For further particulars apply to the Food Production Department, 72, Victoria Street, London S.W. 1.

The Week's Work.

THE KITCHEN GARDEN

By J. DUNN, Foreman Royal Gardens, Windsor

CUCUMBERS.—Give a liberal supply of manure water to the roots of Cucumber plants from which supplies are being cut, and maintain a moist atmosphere by frequently damping the walls and floor of the house. The foliage may be syringed twice daily while the weather is favourable, and top ventilation should be given early in the day. Very little fire heat will be necessary during the day, but a little may be applied at night with a view to keeping the atmosphere in a buoyant condition. Thin the shoots carefully and tie in those that are retained, stopping them at the first or second leaf beyond the fruit, according to the space available. Prevent overcrowding, as this would render it necessary to cut away large quantities of foliage at one time, which would have a detrimental effect on the crop. Top-dress the bed with rich manure and horse droppings. Cucumber plants in flat pans must be kept moderately thin. Remove all rough, overgrown foliage, and peg down the leading shoots, regularly stopping the young growth as it becomes necessary. Water freely in the early part of the day, and allow the foliage to become dry before the evening.

SWEDES.—A good sowing of garden Swedes should be made as soon as possible, so that the roots may be available in the autumn and winter. Sow in shallow drills 18 inches apart, and thin the plants to 9 inches in the row. If the Turnip fly becomes troublesome, frequent light dustings of soot should be applied, and the ground between the rows frequently stirred with a hoe. Sifted wood ashes may also be applied.

TURNIPI.—Make frequent sowings of Turnips, and thin the plants as soon as large enough. The hoe should be freely used amongst this crop, and the ground selected should be of a rather cool nature, if possible. Snowball and White Model are good varieties for present sowing.

CARROTS. A good sowing of stump-rooted Carrots may be made in order to make certain of a full supply throughout the winter and spring. If showery weather prevails, these Carrots will be through the surface in a very short time, and should be carefully thinned as soon as large enough to handle. It is from this sowing that the principal supply of Carrots is obtained at Frogmore for winter use, although several sowings of Scarlet Horn are made later. It is important in the case of late-sown Carrots that thinning be accomplished as soon as the plants are large enough, and the hoe should be kept at work between the rows as much as possible. Dust the crop several times with soot during the season, to keep fly and other pests in check.

LATE PEAS.—A sowing of Antecor or some other good variety of Pea should now be made, and another ten days later. If the weather is favourable a supply of pods may be expected from these plants until late in the autumn. Pea plants require support as soon as they attain a fair size; but the latest sowings should be made in a position which is sheltered from west winds, which sometimes do much harm to Peas in October. If dry weather sets in, a mulching of farmyard manure applied in good time will do much to keep the plants in a healthy condition.

FRENCH BEANS.—A sowing of French Beans may be made now to furnish a supply in the early part of August. Sow in an open plot and give plenty of room between the plants, which should be mulched if the weather proves dry. Small sowings of French Beans should be made every ten days, so that it may not be necessary to retain the old plants after they become hard and stunted. The produce from young, healthy plants is of much better quality than from old plants, which, however, may be kept to save a break in the supply if these frequent small sowings are not made at the proper time.

THE ORCHID HOUSES

By J. COLLIER, Gardener to Sir JOSEPH COLMAN, Bart., Gattou Park, Beigate.

CYMBIDIUM.—Cymbidiums include some of the most decorative of Orchids, especially *C. churruum*, *C. grandiflorum*, *C. Lowianum*, and its variety *concolor*, and such hybrids as *C. Panvelin*, *C. Schlegelii*, *C. Gottoianum*, *C. Alexandri*, and *C. Queen of Gattou*. The majority of the plants have passed their flowering stage, and such as require it may be re-potted, but it is not advisable to re-pot often than is absolutely necessary. The treatment, however, is necessary for specimens that have become pot-bound and have not sufficient space in the pot for the development of the present season's growth. Cymbidiums are strong-rooting plants, and require rather larger receptacles than most Orchids; the pot should afford sufficient space to accommodate the roots for several seasons. If the plants are so firmly attached to the receptacles that they cannot be removed without injury to the roots, the pots should be broken and taken away in portions. Disentangle the roots as much as possible without breaking them, and pick out loose portions of the old compost by means of a pointed stick. The pots should be filled with clean crocks for drainage to about one-quarter their depth. A suitable rooting medium consists of a mixture comprising three parts good fibrous loam, one part Osmunda-fibre cut rather short, partially decayed Oak leaves, Sphagnum moss, and sufficient crushed crocks to keep the texture open. Pot moderately firmly, working the compost well between the roots. Specimens that have become bare in their centres, and are in an exhausted condition generally, should be broken up and the portions planted singly in pots of a suitable size. Species with flower spikes of a pendulous habit, such as *C. tigrinum* and *C. devonianum*, are best cultivated in pans, and suspended from the roof rafters. Newly-potted plants should be afforded extra shade and very moderate supplies of water until the roots have become re-established. Let the soil always become moderately dry before applying water. Syringe between the pots several times daily in summer and spray the plants overhead at least twice daily during fine weather. The foliage and pseudo-bulbs should be sponged frequently with an insecticide, as a preventive against attacks of scale insects and red spider. The temperature should be the same as in the Odontoglossum house.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR DAVEY, Abbots Wood, Godalming, Surrey.

GOOSEBERRIES.—Green Gooseberries may be used for tarts, and some may be bottled. By removing part of the crop at this early stage the trees will be relieved, and enabled to develop extra fine berries suitable for dessert purposes. The new shoots on Gooseberries trained on walls should be pinched as soon as they are long enough to permit of this operation. Nail in the shoots that are required for extension, and if insect pests are present syringe the plants with strong Quassia Extract. If caterpillars are seen after syringing the trees, dust the ground with strong lime and kaim, which should effectually stop the ravages of these pests.

PEARS.—Pear trees are growing well, and the shoots require stopping, especially on young, vigorous trees. Make secure the main shoots to prevent them being injured by strong winds. In the case of espaliers it is a good plan to fix small Bamboo canes in position and train the branches by easy stages to the main supports. Examine the trees very carefully for mealy-cods and the Pear-dog, which destroy much of the foliage. Thin the fruits carefully as soon as it can be seen which are swelling. Those that grow in clusters and large fruited varieties require early thinning.

PEACH AND NECTARINE TREES.—These trees should be disbudded for the last time, and the thinning of the fruit completed. The amount of crop retained must be determined by the condition of the tree, and by the variety. On trees which produce very large fruits these must be thinned to at least 9 inches apart. First take off such fruits as are badly situated,

e.g. against nails in the wall, or under the wire of the trellis, or between two branches. Train in a suitable number of the new shoots, and remove all the laterals that are not needed, in order that the light may penetrate to all parts of the tree. Such varieties as *Amsden June*, *Waterloo*, and *Early Alfred* should be given copious supplies of liquid manure and soot-water in dry weather, and syringed every day, wetting every leaf. The best liquid manure is formed from the drainings of the farmyard, but if this is not obtainable use one of the concentrated fertilisers sold specially for fruit trees. Keep the shoots free from aphid, and syringe them occasionally with insecticide.

APRICOTS.—The fruits on Apricot trees are swelling freely. Give daily attention to the work of stopping the shoots, and eradicating insect pests. Stop vigorous shoots growing at the top of the wall.

STRAWBERRIES.—Strawberry plants intended to supply runners early in the season are already sending out offshoots, and preparations should be made for rooting the runners in pots. The plants may be layered direct into 6-inch pots, or pegged into pots $3\frac{1}{2}$ inches in size. Early rich soil should be used; crocks are not necessary for drainage purposes. In order to facilitate the work of watering and hoeing between the rows the plants from two parallel rows may be layered in the space between the one row, thus leaving the next alley free for passage through the bed.

FRUITS UNDER GLASS

By JAS. HIBSON, Head Gardener, University House, Aston, W.

VINES IN COLD HOUSES.—It is possible to cultivate Vines without fire-heat with fair success, especially in warm localities and where the soil is a light, sandy loam and the subsoil not waterlogged. I have in my mind's eye a healthy Vine of Black Hamburgh variety, which fills the house. This particular Vine finishes its crop in perfection every year without the aid of fire-heat. As a companion to Black Hamburgh the ordinary Sweetwater variety may be planted. In favourable localities these Vines are in flower, and the atmosphere of the house should be kept dry. Reduce the number of pot plants in such houses to the lowest minimum. Keep the atmosphere as buoyant as possible by admitting a small amount of air both night and day. With good management there will be but little risk of an attack of mildew. Often in these cold vineries the foliage is allowed to grow too densely, whereas the rods should be trained at a greater distance apart than in the other vineries.

NEWLY PLANTED VINES.—Keep the laterals of newly planted and young Vines pinched, and encourage the leader to grow. Place a bag of soot in the water used for syringing. Young Vines in their second or third year need strict attention. Some of the second year Vines may show a few promising bunches, but do not be tempted to allow any to remain, or at the most only one bunch to each rod. Supernumeraries may be allowed to carry a few bunches the second year, as these plants will eventually be cleared out to make room for the permanent Vines. Vines in their third year should not be allowed to carry more than three bunches to each rod, even if the canes are extra vigorous. It is better to possess one's soil in patience than to overtop young Vines, for the evil caused by overcropping is not easily remedied. Keep a sharp watch for red spider and thrips. Nothing is more effectual at this stage in combating insects than thorough syringing with clean rain water.

FIGS IN POTS.—Figs raised from cuttings rooted this season are getting well established in 8-inch pots. A few fruits may be permitted to ripen if the plants have made good progress. The plants should have four or five main shoots, which, if of good length and vigorous, may be stopped. Do not rely upon bottom heat, but give all the warmth possible in other ways; the temperature of the Pine stove or Melon pit is not too high for young Figs. Moisture should be applied both at the roots and on the branches by syringing. Even if the plants are not likely to

develop fruit it is well to encourage them to make as much growth in their first year as possible. But do not use an undue amount of stimulants to this end, for the soil must be kept sweet. Established Fig trees in pots are making sturdy growth, with leaves of a dark green colour. The shoots of the more forward plants will soon need stopping to distribute the balance of growth and at the same time induce the fruits to develop. We have already top dressed our plants, preferring to be in advance with this operation rather than late, as they were not repotted during the past winter. So far the plants are much overcrowded, but this cannot be avoided, as there will be no extra room for them until the early pot Cherries are cleared of fruit, and these are later than usual this season. The houses in which the Figs are grown are freely ventilated during the day, but closed sufficiently early in the afternoon to economise fire-heat, of which only a small amount is now used.

CHERRIES IN POTS.—We have been picking cherries on our earliest pot trees for a fortnight past. The fruits have been ripened with the aid of a very small amount of fire-heat. The crop is a heavy one, and is proving extremely useful. It is a good plan to shade the house whilst fruit is in ripe or ripening, as it prolongs the development of the crop, thus extending the season with care it may be extended until the earliest fruits are ripe on south walls out-of-doors. Only a thin, or scrim, shading is needed, just sufficient to break the rays of the sun and prevent the temperature of the house from rising too high. Clear water only, and preferably rain water, should be given the roots, and this not in an excessive quantity. If these pot trees show a tendency to grow somewhat freely, keep the stronger growths pinched; this will aid in the formation of fruit buds for another year. Keep a close watch for red spider

PLANTS UNDER GLASS

By J. G. WISTON, Gardener to Lady Northmore, Eastwell Park, Kent.

CHRYSANTHEMUMS.—Let the plants be repotted as required before they become pot bound or the shoots will get hard, and growth recovery a check. The compost for the final potting should consist of rich loam, mixed with a little bone meal, soot and sand. Use the potting stick or rammer freely, as plants potted loosely in a rich compost make soft, woody growth instead of solid short-jointed wood. Stand the pots on a bed of ashes or other firm base, and let the plants have sufficient room for their development. Stake the plants before there is a danger of the shoots being damaged by high winds.

PERPETUAL-FLOWERING CARNATIONS.—Young plants intended for flowering in autumn and early winter must be given their final potting without delay. No Carnation will flower satisfactorily in the winter unless the pots are previously filled with healthy roots. When in this stage they readily respond to a little good plant food. If the plants are not so forward as usual do not over-pot them, as this would tend to make them later in developing blooms. The soil used for the final potting should be principally good loam, somewhat heavier in texture than that used for previous pottings. A shallow frame on ashes is an excellent place for them when potted. When they have re-established themselves they may be placed outside, but they must be protected from excessively heavy rains. Pinch the shoots early in the season if early blooms are required. Plants in flower should be shaded to prevent the blooms from losing their colour. Feed regularly and water freely. Carnations always pay for good cultivation.

SOUVENIR DE LA MALMAISON CARNATIONS. Plants of the main batch are now opening their blooms, and the supports should be put on with out delay. I have used the "Asot" support for many years, and find it quite satisfactory. These supports enhance the beauty of the bloom and add materially to the length of time it remains in good condition. No more manure should be given after this date. Keep the houses well ventilated, day and night. Shade from all

sunshine, which at this season quickly takes the colour out of the blooms. On very hot days the syringe should be freely used amongst the pots and foliage to ensure a cool atmosphere and keep red spider in check. If plants are required for decorative purposes in rooms select those with healthy, well-coloured foliage, just before the blooms are at their best. These will last in good condition for a long time.

THE FLOWER GARDEN

By W. J. GRISB, Gardener to Mrs. DUMSTRE, Keele Hall, Staffs.shire

TUBS AND VASES.—It is a good plan to place portable tubs and vases in cold houses for a week or so after they are planted. The plants will soon become established if they are syringed daily and shaded slightly from bright sunshine. Where vases are fixtures on terrace walls or steps, the plants should be hardened and established in pots, for usually such situations are exposed to cold winds. In such cases it is advisable to insert pieces of Yew or other evergreen around the plants in the receptacles to protect them. The compost should consist of a mixture of loam, leaf-mould, and decayed manure, with sufficient sand to keep the compost open. Tubs should be painted bronze green, a colour that lends itself to any form of decoration. Vases are generally of stone colour in keeping with their surroundings. The most popular plants for the purpose are *Fuchsias*, *Zonal* and *Ivy leaved Pelargoniums*, *Hydrangeas*, *Marguerites*, *Begonias* (these do better in a rich, light compost in which a little peat has been incorporated), *Calceolaria amplexicaulis*, the spreading varieties of *Lobelia*, *Salvia*, *Verbenas*, *Heliotropiums*, and *Sweet Peas*. *Zonal* and *Ivy leaved Pelargoniums* are always attractive. Such varieties as *Paul Crampel*, *Madame Crousse* (both the pink and scarlet sort), *Souvenir de Charles Turner*, and *Beauty Supreme*, may be used exclusively for furnishing tubs or vases for immediate effect. The soil should be made firm and a moderate watering given the roots through a coarse sieve. Syringing with tepid water in the evenings is beneficial, and stimulants are necessary, or the plants will soon become exhausted.

SUMMER BEDDING. Bedding plants should be once transferred to their final positions outside. Directly the plants have finished flowering the beds should be cleared and a light dressing of short manure and leaf-mould worked into the soil. If the beds are watered a day previous to planting, and again directly the planting is over, to settle the soil about the roots, no more attention will be required for some time, if the plants are sprayed each evening. Examine the plants carefully to see if they are dry before setting them in their final quarters. Root stakes must be placed by the tall plants before they get twisted or broken. Wire pins are the most suitable, where the plants are to be pegged down. Run the flat line between the plants during fine weather to conserve the moisture and prevent the soil from becoming caked.

DAHLIAS.—If the ground has been prepared in advance, only a light forking will be necessary after the plants are placed in their final positions. Care should be taken that the plants in pots do not suffer for want of water. Make the soil firm about the roots, and place a neat take by each, directly the work is finished. The large stakes may be placed in position at a later period. Directly the plants are established, a light mulching of decayed manure and leaves in equal proportions will be beneficial. Occasional syringings of some insecticide will keep insect pests in check.

BEGONIA.—Plants in pots or boxes will now be ready for their final positions outside. The beds should be well prepared for tuberous *Begonias*, and a partially shaded position selected. Leaf-mould, Mushroom bed manure, and a little peat should be incorporated with the soil, especially where it is heavy and retentive, and it should be made moderately firm. Apply water through a coarse rose after the beds are planted. Syringe the plants each evening until they are established in their new quarters. A light mulching of cocanut fibre or leaf-mould at a later period will assist them considerably.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher—Our correspondents would oblige delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents—The Editors do not undertake to pay for any contributions or illustrations, or to return unused contributions or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 58.4

ACTUAL TEMPERATURE—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, June 7, 10 a.m.: Bar, 29.5; temp 70.5; Weather Sunny.

Daffodils in 1917.

The Daffodil season of 1917 has proved one of the latest and, in consequence, the shortest that this generation has known. Severe wintry weather, with frequent snow showers, continued until the middle of the month of April, and till then not a flower appeared; but the sunshine of the last day or two of April and early in May caused the flowers to open with great rapidity, many of them lasting out-of-doors in good condition for barely a week. As some compensation for this brief flowering season, the blooms remained beautifully clean, scarcely a drop of rain having fallen on them from start to finish.

A curious effect of the season has been that the flowers in many cases opened very small in size, so much so in some cases as to appear out of character, and they only attained something like their normal size after being out for some few days. This peculiar feature seemed specially marked in some varieties of the Barrii section, such as Seabird and Beegonia.

The table in the next column shows the dates of first opening, in a garden to the north of London, of fifty varieties selected to range over the season, and be representative of the Daffodils usually opening at the periods named in the table.

The first column shows the average date of opening of the past five years. Speaking generally, the years 1912 and 1913 were rather early seasons for Daffodils, while 1915 was unusually late, but nothing like that of 1917. The earliest date of opening is given in the second column, and this usually occurred in 1912, but in a few cases in the following year. The final column gives the dates of opening in 1917. It will be observed that while the normal period of opening of the varieties selected extends over two and a half months, it has this year been compressed into a little over a month, but that the usual consecutive order has been fairly preserved, the differences not being greater than might be accounted for by differences in the times of planting, in the position of the bulbs in different years, errors of observation, and so on.

recurvus 1	.. 26	.. 14

The unusually fine weather and hot sun which prevailed during the whole of the time the flowers were open, while it severely tried all the blooms, was especially injurious to the red-cupped section. In many cases a flower which opened one day was faded the next, and the only way by which one could see the flowers at all in character was to gather them before they opened and keep them indoors. Lucifer and Cardinal appeared to keep their colour better than most of those with red cups, and among the newer varieties Charm seemed specially good in retaining its colour and character.

We were much struck this year with the lasting qualities of Glory of Leiden. Its

form is rather coarse, but it holds its head well up in the garden, and though among the early trumpets in opening, it succeeded in outlasting most of the others.

Another yellow which has great lasting power is Solfatare, which was still in tolerable condition so late as May 20. It belongs to the Incomparable section, and has a very pleasing, soft yellow shade of colouring. In the same section Home-spin makes a showy garden flower; it is nearly a self-yellow, and holds its head well up, a great advantage in any flower employed in a mass. Two comparatively new comers in this section, Giraffe and Noble, give promise of becoming useful for massing when the supply of bulbs will permit of this being done.

It has been a great year for the Leedsii varieties. Most of them open a pale creamy yellow, taking a few days to turn white; but this year the transition stage was scarcely noticeable. Not many of the giant Leedsii which are so striking when staged have yet earned a place as bedding varieties; White Countess, however, has a fine stance, is tall, and shows itself to advantage. The small-cupped section is, however, most attractive for this purpose, and there is, as yet, no more beautiful bed than one of Evangeline, its rounded perianth, tall stature, and graceful pose showing to great advantage when it is allowed a bed to itself. Queen of the North, perhaps a trifle taller, is another Leedsii that promises to be useful for bedding.

The poets, like the red cups, suffered too soon from the sun to make it a satisfactory year for them. The newer forms, Cadmon, Kestrel, and Socrates, and the older Virgil, Horace and Laureate, retained their colour rather better than some others, while the old recurvus, latest of all, except the double white, suffered least of all in this section, for it escaped the sunburnt and faded into the cooler weather.

Daffodil growers will look forward to next season, hoping it may be a mild spring. The present year, though interesting from the point of view of its unusual character, has given us but a month of flowers, and though it may have been "a crowded hour of glorious life," a season that will give three good months of flowers is more satisfactory, and fortunately more common.

HORTICULTURAL CLUB: VISIT TO WISLEY GARDENS.

The members of the Horticultural Club will this year visit the Royal Horticultural Society's Gardens at Wisley on the occasion of their annual outing. The visit will take place on Thursday, the 21st inst., and details of the excursion will be published in our next issue.

MR. PROTHERO AND THE GARDENERS' COMPANY.

In our last issue we referred to the election of Mr. R. E. PROTHERO, President of the Board of Agriculture, as a member of the Worshipful Company of Gardeners (see p. 225). Speaking in acknowledgment of the honour conferred upon him, Mr. PROTHERO, after referring to the great development which had taken place during the past year in the direction of establishing allotments, said: "It always strikes the visitor in France and in Belgium that right up to the mouths of the colliery pits and to the

deots of the great manufactories you find gardens laid out and cultivated to the utmost perfection. That is one of the things that during the past four or five months we have tried to bring about in this country. I think it may interest you to hear a few figures. We have in urban areas laid out 172,000 additional gardens. They are not of great size; they are gardens of 10 poles and upwards in extent. The great railway companies and the great collieries have extensively given garden ground, so that we may say there is an additional number of something like 500,000 of these gardens now being cultivated for crops. I mention especially the Vacant Land Cultivation Society, which is doing extraordinarily good work with the most unpromising material. Old bits of building land have been turned into gardens, and promise to be highly productive. In Bermondsey there are gardens which, I believe, will produce really good crops. In Middlesex there are 1,000 additional acres under small cultivation. Before the war Wandsworth had 100 allotments; to-day it has 2,200. Southall has 2,000 to a population of 30,000 people, which means a 10-rod plot to every three houses in the town. The same spirit is showing itself in the enthusiasm for spraying Potatoes, which is a very necessary thing. Last year we had a rather lamentable failure in our Potato crop, and we do not know how valuable Potatoes may be to this country in the months to come. We have a greatly increased area, and are taking every precaution to provide all the proper copper sulphate material for spraying. My Board also provides the sprayers, and sells them to different parts of the country. Devonshire has ordered 500 of these knapsack sprayers, Cornwall 400, and Glamorgan 200." Mr. PROBERT paid a tribute to the great assistance given by Professor KEBLE to the Board of Agriculture and the country at large. To his energy and advice, he thought, they owed a large part of the success they had attained.

ACIPHYLLA SQUARROSA—We are indebted to Sir EDMUND G. LODGE for the illustration in fig. 89 of a plant of *Aciphylla squarrosa* which is growing in his garden at Leonardlee, Horsham. Sir EDMUND sent us two photographs of the same plant, pointing out the peculiar phenomenon displayed by the plant of inclining the flower-spike to right and left alternately. The plant is 5 feet across, and the flower-spike 5 feet high. The old leaves are remarkably rigid. *A. squarrosa*, commonly known as the Bayonet plant, is a native of New Zealand, and a member of the Umbelliferae. The flowers are white.

M. G. T. GRIGNAN, who for ten years or so has been on the editorial staff of the Parisian journal, *La Revue Horticole*, has recently been appointed to form a Department of Horticultural Instruction at the Ecole des Beaux Metiers at Barcelona (Spain).

THE HONOURS LIST. The news that the Rt. Hon. Lieut Colonel MARK LOCKWOOD has been elevated to the peerage will be received with great pleasure by horticulturists, for Colonel LOCKWOOD is no less popular among gardeners than he is among the members of the House of Commons. Not is his popularity dependent only upon a charming personality, Colonel LOCKWOOD's gentility of manner is linked with shrewd judgment and powers of hard work, always at the service of his fellows. Both on the Council of the Royal Horticultural Society and in his own county of Essex Colonel LOCKWOOD or Lord LAMMORSE, as we believe will be his title—has rendered signal services to horticulture, services enhanced by the unvarying cheerfulness with which they are always given. Other noteworthy honours are a Privy Councilship to Mr. EVELYN COLE, whose great interest in education in general and in school gardening are well known, and a knighthood to Mr. GUYHAM BALFOUR, who, in his capacity of Direc-

tor of Education in Staffordshire, has also rendered valuable services to the development of horticultural education in his county.

WAR ITEMS.—A correspondent sends from the North of France blossoms taken from fruit trees which the Germans cut down before retreating. He writes: "All fruit trees show signs of very heavy crops this season."

—M. BENOIT BESSEY, son of the well-known Lyons seedsman, after having been wounded while serving in the cavalry, joined the Air Service. He has since been mortally wounded in an air-fight on the Somme.

—For the third time Capt. L. C. BARRY has been mentioned in Army Orders for gal-

lery; and JAMES WOODWARD, journeyman in the plant department.

—Captain E. R. RIXFORD, second son of Mr. R. RIXFORD, Melbury House Gardens, has again been wounded in France. As private in the London Scottish he was wounded in the famous charge of that regiment on October 31, 1914.

AZOLLA CAROLINIANA AND MULGEDIUM PLUMERI.—These two plants have been found by Mr. W. H. STANSFIELD, of Southport, growing apparently wild in the neighbourhood of Preston. *Azolla caroliniana* is a native of North America. It is a plant of the order Marsipaleaceae, of which order there is only one representative

FIG. 89. ACIPHYLLA SQUARROSA, FLOWERING AT LEONARDLEE, SUSSEX.

tor of this country, namely, *Ptilotana globulifera*. The *Azolla* in question is always found floating upon the surface of still water, not submerged, as in *Ptilotana*. It is probable, as Mr. STANSFIELD suggests in the *Southport Visitor*, that it is not really wild, but has escaped from some private garden in which Water Lilies and other aquatic plants are cultivated. The *Mulgedium* is a not relative of the native *M. alpinum*, or Snow Thistle, and is common in Switzerland, especially in the meadows around Andermatt. This may also be an escape from a private garden, as it is sometimes cultivated, in herbaceous borders. It is more suitable, however, for a wild garden, its growth being too rampant for an ordinary border. In its native habitat it grows to a height of several feet, and bears pale blue flowers.

and second. He is the son of the late CHARLES BARRY, the famous pomologist of Troyes.

It has just been learned that the son of M. CARRIER of Antilles was killed early in the war.

A committee has been appointed to enquire into the damage done by the retreating Germans to the orchards and fruit trees in the north of France. MESSIS, NASSIE, CHADWICK, BARBER and GROSCHMANN are members, and they will have power to deal with the question in a practical manner.

Mr. W. A. COOK informs us that three young gardeners who were with him at Leonardlee have been killed at the front. JAMES HAVES was foreman in the glass department, SAMUEL WOODS, foreman of the rock gar-

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PROPAGATING VIOLETS (see page 225). If your correspondent is able to obtain runners or cuttings of double Violets from plants which have wintered out-of-doors he is to be envied, for, even after an average winter, the plants in most gardens are rarely so vigorous as those in frames, while this spring the outdoor plants in my garden at Hampton Hill are more dead than alive, and quite useless for propagating purposes. J. E.'s explanation of failures to grow frame Violets satisfactorily is inconsistent. If the plants have their "constitutions impaired by insufficient ventilation" they would naturally be failures, for, as all who have grown Violets successfully know full well, free and abundant ventilation, except when it is actually freezing, is one of the chief essentials. If the frame plants are treated properly no one need fear that in April the plants will be weakly and so worn out as to be unfit for propagating purposes—their vigor at that season is usually undesirably great. A. C. BURLITT.

HARDINESS OF SHRUBBY VERONICA (p. 226).—My garden is situated on the highest point between the River Severn and its tributary, the Stour, and is much exposed to east winds. Of the Shrubby Veronicas, *V. Traversii* is the hardiest, and the past winter has not harmed it in the least. *V. salicifolia* (here 10 feet high) against a wall was badly singed, but is making a quick recovery. *V. parviflora* is quite dead in an exposed position, but only slightly injured against a west wall. *V. Hillebrandii*, which I expected to lose, is coming into flower, and is decidedly harder than is often supposed. *V. pineloides* (syn. *glauco-cornuta*), in a very exposed position, is unharmed. I should class this species as quite as hardy as *V. Traversii*. *V. speciosa* has been killed outright. Can any of your readers tell me the correct name of a little creeping plant with grey leaves that I had from Messrs. Veitch, of Exeter, under the name of *Veronica cinerea*? It is not in my edition of the *Kew Hand-List*. I. B. Goodwin, Boscombe, Kidderminster. [*V. cinerea* will be found in *Index Kewensis*.—EDS.]

WALLICHIA DISTICHA (SYN. **DIDYMSPERMA DISTICHUM**).—The Palm referred to on p. 225 as forming an avenue in the Botanic Gardens, Peradenya, Ceylon, and of which a photograph was reproduced in fig. 85, is included by Hooker in his *Flora of British India*, Vol. VI, p. 419, in the genus *Wallichia*, not in *Didymosperma*. It was discovered by T. Anderson in tropical gorges in the Sikkim Himalaya. There were formerly several young examples of it in the Palm collection at Kew, but there are none now. Hooker describes the plant as having a naked, annulate trunk 10 to 15 feet high and 6 inches in diameter; leaves 6 to 10 feet long, alternate, erect, and arranged distichously, not spirally on the trunk; leaflets 1.2 feet long by about 2 inches wide, narrowing from a truncate apex to the base, and with a large tooth on each side about the middle, glaucous beneath; petiole and sheath short, scurfy. Male spaxis 3.4 feet, very narrow, with many slender crowded branches. Female spaxis 6.8 feet, pendulous, with stout, simple branches; flowers in many spiral series, green. Fruit oblong, obscurely lobed, reddish. Thirty years ago I saw a fine specimen of this Palm in the Botanic Garden, Herbarienhusen, Hanover, which the Director, Hermann Windland, pointed to with pride, and spoke of as the most interesting Palm in his collection at that time the richest in Europe. The best plant I ever had at Kew was about 8 feet high. It was planted out in a border in the Palm House by the side of *Ravennia madagascariensis*, the leaves of which are also arranged in fan-like fashion, and they both died at about the same time, as the result of a low temperature experienced in a winter of unusual severity. It may be noted here that a large number of tropical plants, including Palms and Pandanus, were injured in the same way last spring. *Bentleya Condamina*, and the Double Coconut, *Lodicea seychellarum*, both about twenty years old, having been killed by the cold. H. B.

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 5.

The exhibits at the meeting of the Society on Tuesday last filled the building. The Floral Committee inspected a very large number of novelties submitted for award. One First-class Certificate was recommended, seven Awards of Merit, and one Botanical Certificate. Messrs. DOBBIE AND CO. were awarded a Gold Medal for a group of Antirrhinums, Sweet Peas, and Aquilegias. Not only were the flowers themselves of the highest quality, but their arrangement and grouping won general admiration, especially as such flowers as Antirrhinums are difficult to stage in a graceful manner. The Sweet Peas comprised all the best, both of the old and of the new varieties. Among the novelties were Alexander Malcolm, cerise with a scarlet sheen; Mrs. Tom Jones, blue shaded with mauve; and Mrs. Hitchcock, a fine creamy pink flower of the best type. Several exhibitors showed Roses, principally the climbing varieties, in pots; the season for large blooms grown indoors is waning. Messrs. PIPER'S group contained some exceedingly well-flowered plants of Clematis, and a number of new plants sent over from China by collectors. One of the most attractive groups was a collection of Irises exhibited by Messrs. R. WALLACE AND CO. The spikes of *Eremurus* exhibited by Mr. J. C. ALLEGROVE were exceedingly fine, especially *E. Elwesii* and *E. robustus*, with its white variety. The same exhibitor also showed a number of new Chinese plants, among others a fine rose form of *Primula Billeyanii*. The new *Spiraea Wilsonii*, also shown by Mr. ALLEGROVE, had dense umbels of white flowers borne along the whole length of the branches.

The exhibits of Carnations included, besides the Perpetual-flowering varieties, some fine border flowers from Mr. James Douglas, and a hybrid form (Perpetual-flowering + *Dianthus plumarius*) from Messrs. ALLWOOD BROS. The best of the named varieties were Mary Cross (pink with a maroon centre), Dorothy (deep rose pink with darker centre), and Robert (old rose with maroon centre). The remainder of the floral exhibits included hardy plants, cut sprays of flowering trees and shrubs, Ferns, and mixed lanous greenhouse plants.

The Orchid Committee made several awards, including two Awards of Merit and one Cultural Commendation.

There was only one exhibit before the Fruit and Vegetable Committee, namely, a collection of vegetables from Messrs. BARR AND SONS, which was awarded a Gold Medal. This was a very representative collection of kitchen garden produce, comprising some seventy dishes. The quality was remarkably good.

At the 3 o'clock meeting of the Fellows an address on "Dolphinsium," by Mr. AMOS PERRY, was read by Mr. W. A. Bilbey.

FLORAL COMMITTEE.

Present: Messrs. H. B. May (chairman), J. F. McLeod, J. Heal, J. Green, C. E. Shea, C. Dixon, W. Cuthbertson, G. Reuthe, A. Turner, J. Dyckson, C. E. Pearson, J. W. Mooman, W. P. Thomson, C. R. Fielder, T. Stevenson, E. H. Jenkins, W. Howe, S. Morris, R. C. Nutt, J. J. Jennings, R. Hooper Pearson, R. W. Wallace, A. G. Jackson, H. Cowley, E. A. Bowles, G. Harrow, J. W. Barr, J. T. Bennett Poe, and W. J. Bean.

FIRST CLASS CERTIFICATE.

Robinnia Kelsonii. This species is a native of North America, and has been in cultivation in this country for some years. The specimen illustrated in fig. 90, flowered in Kew Gardens in 1903. The racemes of rose pink flowers are shorter than in the common *Robinnia*, but the individual flowers are larger. It is a first rate flowering shrub, and very effective in its colouring. Shown by Mr. J. C. ALLEGROVE.

AWARDS OF MERIT.

Antirrhinum Platan Donna. A variety of exceptional vigour, the massive spikes bearing flowers of a pale apricot-salmon tint. The base of the hood is tinged with rose pink, and the lip with lemon-yellow. Shown by Messrs. DOBBIE AND CO.

Carnation Maldivin Drummond.—A large, pale pink variety of the Perpetual-flowering type; it is fragrant, and the calyx is not apt to split. Shown by Capt. DRUMMOND, Cadland Park, Southampton (gr. Mr. L. Smith).

Tris sibirica Perry's Blue.—A very tall variety of the sibirica section, with broad, round falls of violet mauve, fading to paler mauve at the edges, with darker reticulations in the upper part, intersected with white and greenish-yellow. The standards are a pale shade of mauve, and the crests paler still, with a clear blue line down the middle. Shown by Mr. AMOS PERRY.

Alagnolia Watsonii.—The flowers of this fine species are globular, creamy-white, and deliciously fragrant. The cluster of crimson stamens forms a mass of rich colour in the centre. The species is fairly well known in gardens, and was figured in *Gard. Chron.*, August 18, 1894, p. 189. Shown by Mr. J. C. ALLEGROVE.

Deutzia Viloiniana.—This handsome flowering shrub has somewhat the appearance of a small-flowered *Philadelphus*. The branches are studded along their whole length with trusses of white blossoms, with golden stamens. The foliage is lanceolate, very pointed, with serrated margins; the leaves are dark green above and glaucous beneath. A very floriferous shrub, which would form a good garden plant. Shown by Mr. J. C. ALLEGROVE and Mr. C. TURNER.

Tris Binglewe.—A very striking variety, with a branching habit, which greatly adds to its attractiveness; this is derived from *T. pallida*, through which the variety has its descent. The falls are violet purple; the standards, of the same shade, bear darker reticulations. Shown by Messrs. R. WALLACE AND CO.

Syringa Miss Ellen Willmott.—This was a very fine double white variety of Lilac, which would make a striking feature in a shrubbery, or as a single specimen on the lawn. Shown by Mr. C. TURNER and Messrs. PAUL AND SONS, Cheshunt.

BOTANICAL CERTIFICATE.

Rheum Alcatraz.—This plant bore long spikes, well furnished with greenish-yellow bracts. The leaves, which were borne on long petioles, were dark green, and very handsome. Shown by Mr. J. C. ALLEGROVE.

GROUPS.

The following medals were awarded for collections:—*Gold Medal* to Messrs. DOBBIE AND CO., Edinburgh, for Sweet Peas, Antirrhinums, and Aquilegias. *Silver-Gilt Banksian Medals* to Messrs. W. PAUL AND SONS, Waltham Cross, for Roses; Messrs. PIPER, Bayswater, for climbers; and Messrs. R. WALLACE AND CO., Colchester, for Irises. *Bronze Flora Medal* to Mr. J. C. ALLEGROVE, Langley, for *Eremurus* and other hardy flowers; Messrs. ALLWOOD BROS., Weyfield, for Perpetual-flowering Carnations; Mr. E. HIGGS, Twyford, for Roses; Messrs. H. E. MAY AND SONS, Edmonton, for Ferns and indoor flowering plants; Messrs. STUART LOW AND CO. Enfield, for Carnations; and Mr. G. MILLER, Wisbech, for hardy flowers. *Silver Banksian Medals* to Messrs. B. R. CANT AND SONS, Colchester, for Roses; Messrs. J. CHEAL AND SONS, Crawley, for flowering trees and shrubs, and Star Dahlias; Mr. James Douglas, Great Bookham, for Border Carnations; Messrs. W. CUTBUSH AND SON, Highgate, for miscellaneous flowers; Mr. R. C. NORCOTT, Woodbridge, for flowering shrubs; and Mr. G. REUTHE, Keston, for hardy plants. *Bronze Banksian Medals* to Messrs. H. CANNELL AND SONS, Eynshford, for Pelargoniums; Mr. F. GIFFORD, Hornchurch, for single Paeonies; and Mr. I. C. JENNER, Rayleigh, for Perpetual-flowering Carnations.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, and Messrs. Jas. O'Brien (hon. secretary), Frederick J. Hanbury, Pantin Ralli, Chas. H. Curtis, Walter Cobb, J. Charlesworth, T. Armstrong, R. Brogan-White, W. Bolton, C. J. Lucas, R. G. Thwaites and R. A. Rolfe.

AWARD OF MERIT.

Miltonia vealiana var. *Sir Mervyn Buller* (c. *Miltonia* G. D. Owen × *S. Leopoldi*), from Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells. A great success obtained by

crossing two forms of *M. axillaria*, each with its characteristic dark claret-rose mask on the lip, and as a result obtaining a larger and better flower in every respect. The finely shaped flower has a labellum 4 inches across, bright rose in colour, with a triangular, maroon crimson mask, short, oblong rays at the sides, and two ascending crimson lines in front of the column, and corresponding lines on the bases of the lateral sepals. The broad sepals and petals are bright rose colour. The whole flower is well arranged in all its parts.

Cypripedium niveum, *The Crown Variety*, from PHILLIP SMITH, Esq., Manor House, Ash ton-on-Mersey (gr. Mr. Thompson). The species received a First Class Certificate in 1871, and has since been shown in quantity. The *Crown* variety has broader petals, and a larger lip than any of the ordinary forms. The flowers are pure white, with minute purple spotting on the inner halves of the segments and lip. The plant was remarkably well cultivated.

CULTURAL COMMENDATION.

To Mr. Collier, gardener to Sir JEREMIAH COLMAN, Bart., Gatten Park, Surrey, for a plant of *Dendrobium acuminatum* carrying six spikes of pretty rose coloured flowers with darker centres. The species, which is also known as *D. Lyonii*, is a native of Manila, and probably identical with the Bornean *D. Theacherianum*. It was awarded a First Class Certificate on August 17, 1909.

GENERAL EXHIBITS.

Sir JEREMIAH COLMAN, Bart., showed fine specimens of the rare *Saccolabium ampullaceum* with ascending spikes of dark rose coloured flowers.

Dr. MIGUEL LA ROZE, Bryndur, Rochampton Lane (gr. Mr. Crosswell), exhibited *Cattleya Aphrodite* Bryndur variety and *C. luminosa* Bryndur variety, both of excellent quality.

R. BROOMAN WHITE, Esq., Adderbrooch, Garsloothhead, showed a selection of flowers of some of the older and better forms of typical *Odontoglossum crispum*, and of hybrids raised at Adderbrooch, very finely developed.

Messrs. ALBERTSONE AND BROWN, Orchidhurst, Tunbridge Wells, were awarded a Silver Flora Medal for an effective group of good hybrids exceptionally well grown, in which hybrid Miltonias, including the delicately tinted *M. Miss Louisa Fowler* and the bright rose coloured *M. Frank Bender*, were prominent. Among *Odontiodia*s, *Oda Jean*, *Orchidhurst* variety, with large reddish claret flowers having broad labellum mottled with deep rose colour; *Oda General Haig*, *Orchidhurst* variety, with a spike of nineteen fine flowers richly spotted with Indian red, and with a broad light purple margin, are new. Other rare plants noted were *Odontoglossum Epicasta micranthemum*, *O. Menier* var. *St. Vincent*, a gem of the Braconhurst collection; white *Cattleyas*, and the brilliant scarlet *Odontiodia Chantler*, *Orchidhurst* variety.

Messrs. SUNDER AND SONS, St. Albans, were awarded a Silver Banksian Medal for a group of *Laelo-Cattleya Fascinator* and other showy hybrids. (Silver Banksian Medal.)

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, were awarded a Silver Banksian Medal for a group of *Cattleya Mossiae*, *C. Mendelii* and some good hybrids. (Silver Banksian Medal.)

Fruit and Vegetable Committee.

Present: Messrs. J. Chal (vice chairman), W. Wilks, P. A. Tuckett, E. A. Bunyard, H. Markham, J. C. Allgrove, A. R. Allan, P. C. M. Veitch, W. H. Divers, J. Vert, W. Bates, and G. P. Berry.

A *Gold Medal* was awarded to Messrs. BARR AND SONS, King Street, Covent Garden, for a collection of vegetables. The produce was exceptionally good, especially Tomatos Golden Globes and Wrote Beauty, Curost Earliest; Peas Duke of Albany and Little Marvel; Cauliflower First of All; Cucumber Delicieux; Cabbage Best of All, and Potatos Sharp's Express and King Edward VII. There were also Onions, Leeks, Mushrooms, Asparagus, Marrows, and others.

TRIALS OF STOCKS UNDER GLASS AND MYOSOTIS AT WISLEY, 1917.

Awards have been made by the Royal Horticultural Society to Stocks grown under glass in the Wisley Gardens. We print the official report:

STOCKS.

AWARDS OF MERIT.—*Crimson Brompton*, sent by Messrs. R. Veitch, Exeter; *Mammoth Pale Lilac*, sent by Mr. Dawkins, Chelsea; *Mammoth Pyramidal Flesh Colored*, sent by Messrs. Hurst,

London; H. J. Vansittart Neale, sent by Messrs. Hurst; Intermediate White, sent by Messrs. R. Veitch; John Bright, sent by Messrs. Dickson and Robinson; Madame Riviere, sent by Messrs. Dickson and Robinson; R. Veitch, and Hurst; Mammoth Park Blue, sent by Mr. Dawkins and Messrs. Hurst; Mammoth Pyramid Tasse, sent by Messrs. Hurst; Mammoth Pyramid Salmon Rose, sent by Messrs. Hurst; Mammoth Pyramid 10-week Bloo of Bel's, sent by Messrs. Hurst; Mammoth Pyramid 10-week Crimson, sent by Messrs. Hurst; Mammoth Pyramid 10-week Lilac, sent

FIG. 90.—BORONIA KLESAYANA. COLOUR OF FLOWERS, ROSE-PINK. (Awarded First-class Certificate at R.H.S. meeting on Tuesday, 11th. See p. 236.)

London; *Mammoth Rose*, sent by Mr. Dawkins; Chelsea; *New Giant Light Blue*, sent by Messrs. Nutting, London.

HEEDY COMMENDED.—Abundance, sent by Messrs. Dickson and Robinson, Manchester; Almond Blossom, sent by Messrs. R. Veitch, Exeter, and Messrs. Hurst, London; Beauty of Nice, sent by Messrs. Dickson and Robinson, Manchester; Messrs. Hurst, London; Messrs. Watkins and Simpson, London; *Cote d'Azur*, sent by Messrs. R. Veitch and Messrs. Hurst; East Lothian Crimson, sent by Mr. A. Dawkins; East Lothian Scarlet, sent by Messrs. R. Veitch; Giant Brompton Crimson, sent by Messrs. Barr,

by Messrs. Hurst; Mammoth Pyramid Yellow, sent by Messrs. Hurst; Mont Blanc, sent by Messrs. Hurst; Nice Canary Yellow, sent by Messrs. Watkins and Simpson; Nice Grand Early Simon, sent by Messrs. Nutting, London; Novelty (mammoth), sent by Messrs. Hurst; Parma Violet, sent by Messrs. Barr and Hurst; Perpetual White, sent by Mr. A. Dawkins; Princess May, sent by Messrs. R. Veitch; Purple Brompton, sent by Messrs. Watkins and Simpson; Queen Alexandra, sent by Messrs. Hurst, Messrs. Watkins and Simpson, Messrs. Dickson and Robinson; Rose of Nice, sent by Messrs. R.

Veitch and Messrs. Hurst; Souvenir de Nice, sent by Messrs. Barr; Violet Queen, sent by Messrs. Dimes, Norwich; White of Nice, sent by Messrs. Watkins and Simpson; White of Nice, No. 2, sent by Messrs. Hurst; Yellow of Nice, sent by Messrs. Hurst.

TRIAL OF MYOSOTIS.

AWARD 1. AERIE.—*alpestris Indigo Queen*, sent by Messrs. R. Veitch, Exeter.

HIGHLY COMMENDED.—*alpestris Indigo Queen* sent by Rev. J. Jacob, Whitechurch; *alpestris alba*, sent by Messrs. Hurst, London; *alpestris stricta alba*, sent by Messrs. Hurst; Blue Eyes, sent by Messrs. R. Veitch; Bonquet (blue), sent by Messrs. Sutton, Reading; Perfection Rose, sent by Messrs. Sutton; Pink Gem, sent by Messrs. Sutton; Pyramid White, sent by Messrs. Carter, Raynes Park; Royal Blue, sent by Messrs. Sutton; stricta White Gem, sent by Messrs. Barr, London; Victoria Rose, sent by Messrs. Barr; White Pearl, sent by Mr. E. H. Bowers, Roscommon.

CROPS AND STOCK ON THE HOME FARM

REARING CALVES.

ON an ordinary dairy farm where milk or butter is the chief concern, the rearing of calves is no important item. In the case of bull calves of no special pedigree value, the aim is to get rid of them as quickly as possible with a view to conserving the milk supply. In the open market such calves at about one week old will fetch 40s. In the case of pedigree Shorthorn calves of either sex where size and quality are of the utmost importance for future stock purposes, the calves should be allowed to run with their mothers for twelve months or longer. In that case milk is not the main factor.

The economical rearing of heifer calves by the utility farmer is of much more importance to him in the saving of milk, especially during the winter months. The calf should be allowed to feed from its mother four days after birth. After that period it should be removed to a warm box and fed artificially. In the morning and evening give two quarts of new milk, preferably that from its parent. At the end of a fortnight after this treatment by adding one quart of separated milk to the four quarts of new milk for another two weeks. Then, in the place of the new milk, substitute warm skim or separated milk, adding some calf meal. I prefer Bibby's Cream Equivalent, of which one short pint is mixed with the milk. There are many other calf rearing meals, all of which are doubtless suitable. Continue this treatment for six weeks. At that stage, or earlier, give a small quantity of good meadow hay.

When the calf is three months old gradually discontinue the meal, but give the separated milk, to which add a little water, as long as is convenient.

At the age of three months the calves should be given a little hay, chaff, and concentrated food. The best food for calves is undoubtedly soft linseed cake containing 9 per cent. or 12 per cent. of oil, and crushed oats. If the calves are having separated milk with their calf meal, one part of linseed cake to two parts oats is sufficient. If, however, water is substituted for the milk then the linseed cake and oats should be in equal portions. At four months old 5 lbs. hay, 3 lb. linseed cake, and the same quantity of crushed oats would be a suitable ration.

At a later stage feed twice daily with cut Mangolds, just a handful to start with, increasing the quantity as it is seen that no harmful effects in scour result. To the Mangold add a sprinkle of cod liver oil condiment, or any other approved appetiser, and give a regular supply of good hay.

The time for turning calves out in grass varies according to the time of birth. For instance, a September calf might, if strong, be given a grass run in May or June, but where convenience exists it is safer to keep them under cover where they might be fed with green Vetches.

Keep the animals in an airy shed or barn, free from draughts, but with plenty of fresh air, before putting them on grass. Fed with dry food under cover the animals grow vigorous and shapely.

The Board of Agriculture and Fisheries have made an Order, to operate on the 19th inst., which withdraws the restrictions on the slaughter of calves imposed by the Maintenance of Live Stock Orders of 1915 and 1916 *E. Molyneux*.

AREAS UNDER WHEAT.

THE Board of Agriculture and Fisheries has received the following particulars from the International Agricultural Institute:—

The area under wheat in France this year is estimated at 10,569,000 acres, or 15 per cent. below last year's acreage.

The total yield of wheat in four countries of the Southern Hemisphere (Argentina, Uruguay, Australia, and New Zealand) in 1916-17 is estimated at 125 million cwt., against 200 million cwt. in 1915-16 and 154 million cwt., the average of the previous five years. The production of Oats in these four countries in 1916-17 is estimated at 18 million cwt., as compared with 31 million cwt. last year, and 26 millions, the average of the previous five years.

REPLY.

WATERPROOFING COTTON AND PAPER.—In reply to T. H. (p. 218), waterproofed calico is the best substitute for glass, as this material lasts much longer than paper similarly treated. The calico should first be tacked on to a light wooden framework of the required size, straining it tightly. The waterproofing mixture is made up of 3 parts pale linseed oil, 1 oz. of acetate of lead, and 4 oz. of white resin. The acetate of lead should be ground up with a little of the oil into a stiff paste, then add the remainder of the oil, well mix, and stir in the resin. Place the mixture in an iron vessel over a slow fire, stirring it well. When quite hot apply with a brush in thin layers, allowing each to dry separately. Usually two or three coats are sufficient. Finely woven calico gives the best results. Calico so treated, when stretched on small frames of the correct size, will be found a fair substitute for glass for glazing greenhouses. If neatly fixed and well stopped with putty there will be very little drip. For temporary use in summer paper lights are of value. The cheapest grade of cartridge paper is suitable, and this should be fixed to the frames in the manner advised for calico. Damp the paper all over with a sponge wrung out of a bowl of water, and when dry the paper will be found to be strained tightly. Paint the upper surface of the paper with boiled linseed oil into which a small quantity of white lead has been worked. If carefully handled and care is taken to prevent them being blown about by winds, these paper lights will last much longer than might be expected. *F. C. Riddell*.

ANSWERS TO CORRESPONDENTS.

APPLE AND CHERRY SHOOTS WITHERING: L. G. P. It is not possible with any certainty to identify the cause of the shoots withering, but we may say that this year there are large quantities of boring maggot on fruit trees, which cause damage similar to that which you describe. There is one in particular which bores a hole through the base of the shoot, where it joins the main stem. You had better examine the affected trees, and see if this has occurred; if you have not many trees, your best plan will be to pick off by hand every maggot you see, and destroy it.

CATERPILLARS ON APPLE TREE: T. H. Palmer. The caterpillars infesting your Apple tree are those of the Lackey Moth (*Chissocampa nestrus*). The moth lays its eggs in bands around the young branches, each band containing from 40 to 200 eggs. In colour they are dull greyish brown. About the end of April they hatch out; the young caterpillars are at first dark and rather hairy. They soon begin to form a web of fine silk, beneath which they shelter, venturing out after a time to feed, but returning to their shelter at night and in wet weather. As they grow they become more brilliantly coloured, when full grown they are bluish grey, with four black spots at the head,

and black, orange and blue stripes down the back. They are about 1½ inch in length. Maturity is reached in the months of June and July, when they spin cocoons of pale silk. In the cocoon the caterpillar changes to a dark brown pupa, from which the moth hatches in two or three weeks.

LABURNUM WITH DIFFERENT COLOURED FLOWERS: C. J. P. Your tree of Laburnum, which is bearing blossoms of three distinct colours, is not attacked by disease, but is an example of a "graft hybrid," between Laburnum vulgare and *Cytisus purpureus*. The variety with pink flowers is known as *Cytisus Adami*, after the original grafter; the yellow flowers arise from the pure Laburnum tissue, and the purple flowers from that of *Cytisus purpureus*. So far as one can judge from anatomical evidence, C. Adami is Laburnum vulgare clothed in an epidermis of *C. purpureus*. In certain cases seedlings obtained from C. Adami have proved to be pure Laburnum.

NAMES OF PLANTS: E. Shaw. *Eonymus Sieboldianus*, a native of China. *Boyssiera*, 1. *Clematis montana rubra*; 2. *Cotoneaster horizontalis*.

ONION SEEDLINGS: J. C. B. The Onion seedlings arrived in a very crushed condition, owing to being packed in too frail a box. They appear to be affected by Onion fly, *Anthonomya ceporum*, a very common pest. The female lays its eggs on the leaves, and the maggots, working down between the leaves, reach the lowest part of the bulb. When fully fed they leave the bud and enter the soil; they there pupate, and finally become perfect flies. It is difficult to rid the plants of the flies, but one of the best preventives of injury is to induce quick, strong growth in the seedlings, and prevent anything in the way of a check. Pull up and burn all infested plants, and water the rest of the plants and the bed with strong soap-suds; or, in the case of a very bad attack, with petroleum emulsion, in the proportion of 1 gill to a gallon of water.

PEAR LEAVES INJURED: P. S. H. The Pear leaves appear to have been injured by the Pear Leaf Blister Mite, *Eriophyes pyri*. You state that the mite does not interfere with the fruiting of the tree, but we must warn you that although, in the past, it has chiefly attacked the leaves of trees, lately it has also attacked the fruit-buds, which it has completely destroyed. Pick off and destroy every leaf which shows signs of the disease; if you persevere the disease will completely disappear in a year or two.

PELAGONIUMS DISEASED: J. L. Lowwood. The spotting and blotching of the "Geraniums" is caused by the very common fungus, *Plectytis cinerea*. The disease occurs commonly on dead parts of most plants, and spreads to living plants; hence the necessity of cutting off and destroying dead blossoms, removing dead plants, and maintaining hygienic conditions in the glasshouses and gardens generally.

PINE GROWING: C. T. For small suckers just received select some good fairly yellow loam, preferably loam that has been stacked for some time, rejecting the finer portions. To this add a fair sprinkling of crushed mortar rubble, and should the loam be somewhat heavy, add also a little peat or leaf soil. Put quite firmly, for this will help to keep the suckers erect and suit them generally. Use quite small pots; a 5 inch pot is ample, but even a smaller size if the suckers are small. If a Melon house or pit is in work, either would suit them well if plenty of heat is provided. After giving one good watering, be cautious with the watering can until the roots become active. Bottom heat will encourage them to root more quickly, and is almost indispensable in Pine cultivation. Take particular care not to put the suckers in a house where there is any suspicion of white scale being present, for this pest is one of the greatest hindrances to good Pine culture.

Communications Received.—H. V. O. (Many thanks). Seedman who should have sent your name and address, and necessity for publication but as a guarantee of good faith)—J. A. P., T. C. E. M.—E. M. H., E. J., C. R., I., L.—C. N. R. Farrer.

MARKETS.

COVENT GARDEN, June 8

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their average wholesale prices. Includes items like Arafia Sieboldii, Asparagus plumosus, Aspidistra, Cacti, Calceolaria, Cocos Weddellii, Crassula, Ericas persoluta, Fuchsia, Geranium, Carnations, Cornflowers, Delphinium, Gladiolus, Gypsophila, Heather, Iceland Poppies, Iris, Lilium longiflorum, Nigella, Orchids, and Sweet Peas.

REMARKS: Trade is now very brisk in this district. There is a good demand for all bedding varieties. Marguerites, Heliotropes, Mignonettes, Verbenas, Hydrangeas, a few good Erica, and various kinds of Rambler Roses are in sale.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their average wholesale prices. Includes items like Carnations, Cornflowers, Delphinium, Gladiolus, Gypsophila, Heather, Iceland Poppies, Iris, Lilium longiflorum, Nigella, Orchids, and Sweet Peas.

REMARKS: Double white Narcissus is now over for the season. Double white Paeoniam and white Stock are selling freely, and the supplies of these flowers are scarcely sufficient for the demand. There is a good display of the single varieties of Paeoniam which are very popular. There is an advance in prices for the choice Flowers, Irises, Gladiolus, Sweet Peas, Iceland Poppies, Lily of the Valley, and all Libanum are much scarcer. Carnations are soon brought up. Good Roses are obtainable at the present time. The weather is no longer accountable for the inferior quality of the blooms.

Convolvulus and Nigella (Love in the Mist) are more plentiful

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their average wholesale prices. Includes items like Asparagus, Beans, Beetroot, Broccoli, Cabbages, Carrots, Cauliflowers, Cucumbers, Garlic, Herbs, Horseradish, and Leeks.

Fruit & Veg. Average Wholesale Prices.

Table listing various fruits and vegetables and their average wholesale prices. Includes items like Almonds, Bananas, Dates, Figs, Go-sberries, Grapes, Lemons, Nuts, Oranges, Peaches, Strawberries, and Tomatoes.

REMARKS: The market is generally cleared of British and Foreign fruit. A few specimens of Avocado are still in the market. The market for Asparagus is very quiet. The market for Strawberries is very quiet. The market for Grapes is very quiet. The market for Lemons is very quiet. The market for Nuts is very quiet. The market for Oranges is very quiet. The market for Peaches is very quiet. The market for Strawberries is very quiet. The market for Tomatoes is very quiet.

THE WEATHER.

THE WEATHER IN SCOTLAND. A cold, dry, westerly wind, with the accompanying feature of the variable during May. The month on the whole was a dry one, the number of rainy days being 14, and the rainfall 4.14 inches. The temperature was 47.7, the highest being 56.7, and the lowest 29.2. The number of hours of bright sunshine was 172, and the number of hours of overcast was 128. The number of hours of fog was 12. The number of hours of rain was 12. The number of hours of snow was 0. The number of hours of hail was 0. The number of hours of sleet was 0. The number of hours of drizzle was 0. The number of hours of mist was 0. The number of hours of clouds was 0. The number of hours of sun was 0. The number of hours of moon was 0. The number of hours of stars was 0. The number of hours of planets was 0. The number of hours of comets was 0. The number of hours of meteors was 0. The number of hours of aurora was 0. The number of hours of eclipses was 0. The number of hours of other celestial phenomena was 0.

GARDENING APPOINTMENT.

Mr. J. T. Nicol, for the past 4 years, Gardener to the Hon. & Right Hon. Earl of Leitch, Leitch, Perthshire. Mr. Nicol is a member of the Royal Horticultural Society, and has been awarded several medals for his services to the garden. He is also a member of the Royal Society of Gardeners, and has been awarded several medals for his services to the garden. He is also a member of the Royal Society of Gardeners, and has been awarded several medals for his services to the garden.

(Continued from page 11)

GARDENER (HEAD WORKING): life on garden in all branches, excellent testimonials, death the cause of leaving (inhabitable T. W. H. Mount Pleasant, Arundel).

GARDENER (HEAD WORKING): thoroughly experienced all branches, manage small estate, highest references, over military age, Christian; abstemious; married the family, B. Box 2, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD WORKING): thoroughly experienced all branches, where 3 or more are kept (normal times), previous situations 12 and 10 years (Head), age 45, a daughter could help if required, good references, now unemployed. Apply, GARDENER, c/o Clerk, messenger, Midland, Sussex.

GARDENER (HEAD WORKING), where 2 or 3 kept, married, two children, experienced inside and out, good references—SPENCER, Blackbrook, Gosmont, Hereford.

GARDENER (HEAD WORKING), where several are kept in normal times, age 45, married, life experience in all branches; would undertake management of small stock and land if required, also own age 17, 24 years' experience; good references. Z. Box 7, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD WORKING) and MANAGER: small farm and estate if required, 30 years' practical experience; 21 years as Head, excellent references, age 50, one boy aged 15, W.M. SWER, 5, Thomas Street, St. John's, Tunbridge Wells.

GARDENER (HEAD WORKING): 6 or more are kept in normal time, life experience in all branches, age 47, married (no family), excellent references, most prominent and prestigious employers—BEALE, New Cottage, Llanwrthwl, Newport, Mon.

TRADE.

MANAGER or FOREMAN: life expert in all branches in the Trade, controlling labour and producing crops in large quantities. Plants, Flowers, Fruit, Vegetables. LAWRENCE 83 Watwick Avenue, Bellingham.

FOREMAN (WORKING), disengaged; 28 years' general experience, Tomatoes and Cucumbers specially, excellent references, inhabitable. H. GIFFORD, West End, Brompton, Cullinampton Devon.

OPEN for Engagement as HEAD SHOP MAN, Manager of Traveller, life experience in all branches, including practical in nursery, over military age—Write, G. K. Box 3, 41, Wellington Street, Covent Garden, W.C. 2.

OPEN for Engagement as HEAD SHOP MAN or MANAGER, upwards of 30 years' experience in all branches of the trade; over military age. Write, G. Box 9, 41, Wellington Street, Covent Garden.

FLORIST: lady desires re-engagement; 12 years' experience with artistic designs, a lot of Plants, Seeds, Bulbs, etc.; disengaged. Write, MISS, 6, 9, Lawrence Road, South End, London.

THE BOOK OF THE MOMENT.

Root & Stem Vegetables

By ALEXANDER DEAN, V.M.H.

At the present crisis the food problem bulks largely. The question of which vegetables contain the most food is a pressing one, and it is found that root and stem vegetables, such as Potatoes, Carrots, Turnips and Parsnips, contain much higher percentages of food value than green vegetables, valuable though these are as adjuncts.

"ROOT AND STEM VEGETABLES"

is a book which treats *only* of those vegetables the root or stem of which is eaten, and is therefore especially valuable to all who are endeavouring to concentrate their attention on growing the most economical forms of food. It contains eight coloured plates reproduced from photographs.

EXPENSIVE ADVERTISING. In these days, when every firm has to advertise or see its business decline, it is necessary to make sure that the needed publicity is so obtained that the results justify the expenditure. It is this consideration that has led most keen business men to discontinue the wasteful method of advertising by catalogue. It requires the mode of any printing firm it will be found that this catalogue printing has fallen away since the war by about 80 per cent. more as this can be witnessed at the price of paper is nearly three times what it was formerly, printing rates are higher, and the cost of postage is much increased, so that the wholesale distribution of large catalogues is now too expensive for business purposes. The new papers, though they themselves are produced at much greater expense all round, have nevertheless refrained from increasing their prices for advertisements, and it is by utilising these permanent media that profitable advertising may still be practised.

SPORTSMEN, Farmers, Horsemen, try our splendid Yorkshire Whippet Tweed; wears like leather; showproof; 7 yards for 12s. 6d. Patterns free. BRADFORD WOOLLEN CO., 71, Bradford.

THE BOOK OF THE MOMENT. Root & Stem Vegetables

By ALEXANDER DEAN, V.M.H.

At the present crisis the food problem bulks largely. The question of which vegetables contain the most food is a pressing one, and it is found that root and stem vegetables, such as Potatoes, Carrots, Turnips and Parsnips, contain much higher percentages of food value than green vegetables, valuable though these are as adjuncts.

"ROOT AND STEM VEGETABLES" is a book which treats only of those vegetables the root or stem of which is eaten, and is therefore especially valuable to all who are endeavouring to concentrate their attention on growing the most economical forms of food. It contains eight coloured plates reproduced from photographs.

SCIENCE AND THE NATION.*

HOWEVER much the welter of war may be deplored, there is no doubt that a time of great stress has a value of its own in forcing us, whether willingly or not, to probe the weaknesses of beliefs, and examine the foundations of practices. Many things can be tolerated without discomfort in times of prosperous peace, and dangers are apt to grow whose very existence was hardly suspected by the mass of the people. They and their rulers have rested content with arrangements that had been good enough for their forefathers, and still seemed good enough for them, before the rude awakening in 1914 brought disillusionment with it. A few thoughtful men and women knew that all was not well, but their voices were drowned in the general shout that all was as good as it could ever be expected to be, and even the widening breach between capital and labour was accepted as something which, if regrettable, was at any rate ineluctable. Perhaps few things have undergone a greater change in the public mind than the position allotted to science from the point of view of its national importance. The whole matter of education has also assumed an aspect it never wore before. There have been Royal Commissions, Departmental In-

quiries, and all sorts of other Governmental machinery constructed to improve education in the past, but scheme after scheme was spoilt, or mutilated in the interest, not of the nation or the children, but of the politician. A very different state of things prevails to-day. We have had to examine the foundations on which our national prosperity rests, and we have not found the result of that examination to be satisfactory. We have had to realise indeed what great results for Germany accrued from the battle of Jena; for the well-constructed and definitely decided policy of education, and particularly scientific education, and the encouragement of research in the country, was started in the stress of those times. We have seen enough of the results of competent direction and foresight, and we have had a glimpse of the pit that lies in the path of a nation that wastes its opportunities of improving for its own purposes the results of advancing knowledge.

The excellent series of essays collected in the book before us has been designed to illuminate one aspect of this national question. Everyone is now agreed that Science is one of the most important branches of knowledge, and especially when viewed from the material standpoint of profit and loss. An important Committee appointed by the late Government is giving earnest consideration to the matter, and without doubt drastic alterations and reforms are in the air. Meantime, a good beginning has been made in the establishment of a national Department to aid scientific and industrial research out of the public funds.

Although many people are now vaguely appealing to science, as to a modern Esculapius whose business it is to find a cure for industrial deficiencies and for other economic evils, there is a good deal of confusion as to what is really meant by science itself, and how its operations are advantageously to be most extended. It is recognised that somehow it is concerned with industry, and the catchword "Science and Industry" is in everybody's mouth.

But in the impending processes of reconstruction the matter is too important to be allowed to suffer shipwreck on side issues, after the manner that has more than once befallen the educational barque in bygone days. We must have a clear idea of what science is, what its proper relation to industry, and through industry to material prosperity, if we are to avoid a fatal repetition of past mistakes. For we are at the parting of the ways. If we do not now learn and profit by the lesson which it has needed a great war to teach us, the writing on the wall will be written for us, as it has already been written for many another great nation before us.

It is just such a collection of utterances as is comprised in this work, issuing from some of the foremost of the scientific men trained at Cambridge, that was wanted to enable the ordinary man, in whom the political power which will make or mar our future mainly resides,

to arrive at a just apprehension of the matter. The key-note of the book, specially emphasised in Professor Bragg's admirable contribution, is the importance of pure science. That is, the building up of a knowledge of nature and the discovery of those immutable, because they are causally related, sequences of events which we term the laws of nature. Often the unravelling of cause and effect is a long and costly process, costly in time, in brain power, and—least important—in money. It is not till these natural laws are discovered that we are able, so to speak, so to control conditions as to ensure the results we require for our own advancement or prosperity. It is often not clearly realised that we never really create anything, either by scientific or other means. All we can do is to arrange conditions, and when these are supplied nature inevitably does the rest. This is a fact, the perception of which is essential to progress. It shows, too, that much of what passes for science is really a craft, a mere utilising for our own advantage, of the formula or recipe which it is the business of science to discover.

But even the fashion in which the recipe itself is to be employed, until it becomes merely a technical art, comes within the purview of science—applied science, as it is often then called. It is, however, the chief glory of science to reveal the mechanism by which things happen, to discover hidden and often unsuspected forces, to examine the relations of energy and matter in their intricate and manifold interactions, and to penetrate the disguises which conceal the reality and simplicity of law under the cloak of the most varied external conditions.

Pure science is the stream of knowledge which fertilises practice. Provided all is right with the fountain, the rest, industrial progress and all that this means, may become possible, but by no means otherwise. Pure science cannot be expressed in terms of pounds sterling, and the ordinary Englishman likes to act on the principle of putting down sixpence on Monday and picking up a shilling on Tuesday. It is this short-sighted devotion to quick profits that is our special constitutional weakness. Perhaps a perusal of *Science and the Nation* may do something to correct this besetting defect in our national character. J. B. F.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT GATTON PARK.

SIR JEREMIAH COLMAN'S collection at Gatton Park, Bengeat, is especially rich in choice Odontiodae and Odontoglossums, and the raising of new varieties of these Orchids has been carried on there for a number of years with much success. There is at the present time a fine display of scarlet Odontiodas and white and variously coloured Odontoglossums. Among the former the more striking varieties noted during a recent visit were Odontioda Chanteclair West-tonbot variety; Oda Lady Colman, a brilliant scarlet flower of exceptionally fine form; and Oda Colmanae, the gem of the collection, which was awarded a First-class Certificate by the Orchid Committee at the Royal Horticultural

* *Science and the Nation*. Essays by Cambridge graduates with an Introduction by the Right Hon. Lord Mountbatten, F.R.S. Edited by A. C. Seward, F.R.S. (Cambridge: At the University Press.) 1917. Price 5s. net.

Society's meeting on May 18, 1915. The flowers of *Oda Colmaniae* are of the largest size, with very broad petals; the ground colour is yellow, with heavy, reddish-claret blotches. In its fine form it partakes of the good qualities of *Odontoglossum Queen of Gatten*, the best yellow-ground *Odontoglossum* yet raised, its other parent being *Oda Bradshawiae*. The principal *Odontoglossum* house presents a fine appearance; it contains choice forms of *O. crispum*, including *O. c. Franz Masereel*, and the beautiful *O. c. Solim*, bearing a strong spike of its clear white flowers with dark claret-coloured labellum. In connection with this remarkable variety it is interesting to note that the unique *O. ardentissimum Memoria J. Gurney Fowler (crispum Solim - Pescatorei)*, in which its peculiarities are reproduced in an extraordinary manner, is now included in the

Royal Horticultural Society on May 8, 1917, when the latter received an Award of Merit. Another plant finely in bloom is the original *D. Triumph (Dalloiseanum - Thyriforme)*, raised by Messrs. Armstrong and Brown. A First class Certificate was awarded to the plant when shown by the late Mr. Fowler on January 19, 1915. Its history was given in *Gard. Chron.*, February 13, 1915, p. 76. The plant now bears a fine spike of large white flowers with claret-coloured blotch on the lip.

In one of the cool houses *Dendrobium Victoria Regina* makes a good show with its gentian-blue flowers with white centres, and various other rare species are in bloom.

The numerous plants of *Cattleya* and *Laelia* *Cattleya* in the intermediate houses have a wealth of flower. White forms, and others with shades of blue, are special favourites. They

FIG. 91.—TREE OF *DENDROSESERIS MICRANTHA*, NAT. ORD. COMPOSITAE, GROWING ON JUAN FERNANDEZ.

Gatten Park collection, the plant being in good condition. Many of the Gatten hybrids are in flower; one very distinct, pretty blotched form is being employed for progressive raising, a use which is also being made of the very richly blotched *O. Lambardeanum* Gatten Prince, which is finely in bloom. In an adjoining house is a beautiful collection of *Miltonias*, including *M. vexillaria Memoria G. D. Owen*, with finely developed flowers, and some of the best hybrids.

Sir Jeremiah Colman has met with great success in the raising of hybrid *Dendrobiums*, his best result being *D. Lady Colman*, which received the R.H.S. First-class Certificate on February 10, 1914. The flowers of this section of *Dendrobium* are now over, after making a good show, being succeeded by the fine strain of *D. illustre (Dalloiseanum - chrysoctoxum)*, of which the Gatten varieties, *Bartelsiana* and *Florence Bartels*, were shown at the meeting of

include a pure white form of *Cattleya* Warner and some excellent white *C. Mossiae*. *C. Mendelii delicta* is a bluish-white improvement to *Queenian* House variety; *C. Mendelii Lady Colman*, a charming white flower with sky blue front to the lip, and many of the best forms of the large flowered *Cattleyas* are in bloom. In one house a batch of the orange-coloured, purple-lipped *Laelia-Cattleya Hippolyta Phoebe*, with the yellow *L.C. Cores* Gatten Park variety, make an attractive display; in another, *L.C. Aphrodite*, *L.C. Candamiana*, *L.C. Epicasta*, and *L.C. Fascinator* are flowering in profusion, probably the best being *L.C. Fascinator* var. *King Edward VII.*, with a spike of four noble white flowers, with yellow disc to the broadly expanded lip, the front lobe of which is rose tinted at the sides. In another house is a fine lot of *Laelia panamara*, with graceful *Thunias* raised at Gatten Park.

CRUSOE'S ISLAND: JUAN FERNANDEZ.

(Continued from p. 231.)

FROM a botanical point of view, Juan Fernandez is one of the most interesting islands in the world. Far removed from the great South American continent and from other islands, it has a unique and special flora of its own. An endemic fauna is frequently associated with such a flora, i.e., many of the genera and species of plants and animals are not found elsewhere. In this respect Juan Fernandez is surpassed only by the Sandwich Islands, where 78 per cent of the vascular plants are confined to the group, as against 65 per cent in Juan Fernandez. As Skottsberg remarks, "it is as if one had been carried back to past geological periods, as if one walked about in a living museum crowded with rare specimens. So many wonderful plants are brought together here on a small area that one must touch them to realise that one does not dream."

The trees are mostly sparingly branched with long, erect, slender, nearly naked branches, crowned by a rosette of large, thin leaves. Many of the trees have tufted leaves, and belong to the Compositae, a family in which trees are comparatively rare. Similar types occur in the Canary Islands, Madeira, and in the African mountains near the Equator. In the last mentioned there are whole forests of Tree Groundsels (*Sesuvium*) which give the landscape a most weird appearance; in the Canaries there are very curious Tree Sow thistles (*Sonchus*); all these remarkable types are probably the relics of an ancient flora, perhaps of tertiary times, or even older, which existed also on the adjacent continents but which has been swept from them by vast geological changes, such as the ice age. In the narrow gorges of Juan Fernandez there is a dense and almost impenetrable primeval rain forest, with here and there one of the remarkable Cabbage Palms which have been so useful as a vegetable to successive "Robinson Crusoes."

In 1895 Prof. Johow, of Santiago, who has published a book on the flora of the island, from which some of our photographs have been taken, proposed to the Chilean authorities that this tree should be afforded protection, and that it should be considered a crime to destroy it. There exists a law on the subject. In the woods creeping or twining plants are almost absent, with the exception of a few Ferns, some of which adorn the trunks of trees. The Sandal wood, which was so much used by the early travellers, is now totally extinct. When H.M.S. "Adventure" (Capt. King), accompanied by the botanist Signor Bertero, visited the island in 1830, no growing Sandal wood could be found, only a large quantity of dry old trees in the valleys. At the time of Skottsberg's visit in 1906, only one tree remained, and it was nearly dead. Although known for such a long period, it was not until 1868 that the species (*Santalum fernandezianum*) was described. The Fern flora is remarkably conspicuous, especially the arboreal species. The number of species of Fern on the island is about one-third of the whole flora. They are a conspicuous feature in the vegetation, forming the chief constituent of the undergrowth. Amongst them are two Tree Ferns which give a pleasing yellowish tint to the general foliage. The common Bracken (*Pteris aquilina*), an almost cosmopolitan species, is entirely absent. Four of the species of Fern are found only on Juan Fernandez. One of these (*Thyrsopteris elegans*) has a striking characteristic; it is the only known instance of a genus of Ferns being confined to a small isolated island. An excellent specimen is grown in the Temperate House at the Royal Botanic Gardens, Kew. The appearance of the Fern when in "flower" is very remarkable, the cup-shaped masses of spores being bundled together and hanging down just like clusters of Millet seed. At the time of Mossley's visit in 1875 there were no trees for the first few hundred feet from the shore, as they had all been felled by the crews of vessels

visiting the island. But Skottsberg says that the Maqui (Aristotelia), a disagreeable tree imported from the American Continent, is now spreading rapidly, and is threatening the original vegetation on the lower slopes of the volcanic hills. The valleys are partly covered with rain-forest composed chiefly of three trees, a Myrtle (*Myrtus fernandeziana*) about 60 feet high, being predominant. Associated with these trees are the Cabbage Palm (*Junonia australis*) and a Tree Fern with massive stems (*Dicksonia bertouana*). There are several plants which, like the Mistletoe, grow on others (epiphytes), species of *Hymenophyllum* (a Fern), and a member of the family Compositae, which are very rarely of this habit; this is *Rhettinodendron Berteri*, a tree destroyer; it commences its life on the branches of some other tree, which it eventually kills and supplants.

Naturalists have not been slow in commemorating in the names of plants and insects those of Alexander Selkirk and his mythical double, Robinson Crusoe. There is an insect called *Variopalpus Crusoi*, whilst Dr. Hensley, the late head of the Kew Herbarium, described a new genus of plants, *Selkirkia*, a member of the borage family, peculiar to the island. There is also *Robinsonia*, a Daisy tree, described by the celebrated Swiss botanist, De Candolle. A Thistle has spread rapidly as a weed, and Moseley humorously describes it growing "as it eager to remind travellers to what race the world owes the immortal Selkirk." Scotland, of course! Amongst the plants of the family Compositae there is a remarkable genus peculiar to the island, *Dendrosicris* (see fig. 91), a kind of Tree Chicory, and closely allied to the genus *Cichorium*. In the appearance of its flowers it is something like a Dandelion, and is very like the Tree Sow Thistles of the Canary Islands. Small, but Excellent Strawberries, of a nearly white Spanish variety, have become naturalised on the lower slopes of the hills. A plant with giant, circular, Rhubarb-like leaves, *Gunnera chilensis* (see fig. 92), gives a pleasant shade during hot weather. The stalks of the leaves are about 7 feet high.

In concluding this sketch of the principal events in the history of Juan Fernandez, it seems fitting that after so close a connection with English literature and with British naval expeditions, the island should have figured prominently in the naval operations of the present war. It will be remembered that during the fight off the Falkland Islands in December, 1914, the German cruiser "Dresden" managed, owing to her superior speed, to escape from the annihilation meted out to her consorts by the gallant Sturdee. It was not until March 13, 1915, that she was cornered at the island of Juan Fernandez by the "Kent" and the "Glasgow," where, after an action lasting only five minutes, she was sent to her last resting place beneath the waters of Cumberland Bay. *J. Hutchinson, Kent*

THE ALPINE GARDEN.

PRIMULA SPICATA

Quite recently this minute but lovely species really took pride of place in the garden. And as its ways are queer, I had better put down my experience of it. Forrest sent me seed some years ago. It germinated freely. But the losses among the seedlings during winter were frightful, though boxes, pots, and pans were under glass. The few survivors flowered freely. But the following spring they came again, glorified beyond belief, and I knew that I had got one of those gems which wipe out all the disappointments of a collecting expedition. I gazed at it with the eye of folly, and it rewarded me by dying without setting a seed. Two years ago Forrest again sent home seed, and the friend to whom it came was kind enough to let me have some. History repeated itself. The seed germinated thickly. The winter almost exterminated the seedling. At this

point, however, I introduced a variation by planting out the survivors in a damp-shaded bed. Here they flowered miserably. During winter I had Gorse over them, which, by the way, is a good specific for throwing *Soldanellas* into bloom. In the spring the *Primulas* came again, changed in most cases from single to many-crowned plants, and showing by their splendid condition how thoroughly they had enjoyed the cold. Every crown is carrying bloom, and the beauty is so rare and delicate that I have the greatest difficulty in getting past it. *Garrison*, *P. mutans* is *P. spicata*'s only competitor. But, warned by previous experience, I am this time taking no chances. Every flower is being hand-fertilised. And the main object of this note is to urge all who have bought plants of *P. spicata* and *P. mutans* from Mr. Wallace, of Colchester, to do likewise. It would be sad if such beautiful plants be lost to cultivation for lack of a little care. *A. K. Ridley, Neston, Cheshire*

the two, and the natural slope of the ground prevents its stagnation. A trench was run back in the bank at one place, the excavation being subsequently filled up with a mixture of Mendip granite and limestone chips, with the minimum of added soil, forming, in fact, what often goes under the name of a monane. *Morisia* confines its natural spreading to the area thus marked out. I have hardly ever found natural seedlings on the ground on either side, though there appears to be no plain reason for its specialised predilection. But in attempting to dig up some very small seedlings for a friend the secret leaked out. I got down about 18 inches, but seemed no nearer the end of the long white tap root, which I suppose perhaps goes down to the neighbourhood of the water that percolates through the stones at the clay level, some 5 feet below the surface. I have never succeeded in getting an entire plant out—that would apparently involve the destruction of the bank and the many good plants that thrive in it, but it would be interesting to know

FIG. 92. VEGETATION OF JUAN FERNANDEZ.

A view of the thicket of *Morisia* (as seen in the foreground), the large rhubarb-like leaves collected by the author, and the table-mount of a specimen. (From the "Chalchango" narrative.)

MORISIA HYPOGAEA

Dr. Sir Robert Maxwell's interesting Notes from a Galapagos Garden, which appeared in the issue of the *Gardeners' Chronicle* on June 2, he refers to *Morisia hypogaea*, an Alpine of the greatest value not only on account of the brilliant yellow of its freely produced flowers, but also on account of its very long period of blooming. As many people seem to find this a somewhat difficult plant to keep, I may perhaps be forgiven for giving my own experience of growing it, the more so since I formerly had many failures with it. But for the last eight years it has been flourishing on a somewhat elevated bank of the rock garden, where it regularly flowers from December till June, and seeds freely, the young plants being quite abundant. But it only thrives in one spot in this fashion, and though I grow it in other places, it dies out there after a year or two.

The rock garden was originally formed by adding the banks of an old gravel pit resting on clay. Water moves freely at the junction of

whether anyone has followed this rather wonderful root system completely out. I should perhaps add that the plant never seems to take harm from either excessive heat or even cold, nor does it, in this position, suffer from drought or damp, both of which I often find to be fatal to specimens growing only a few yards distant.

Of course, it is well known that many Alpines naturally possess root systems which are very large in proportion to the size of the plant. I have found *Brachichium nanum*, for example, growing in fair abundance on the south precipice of the Meije, and one small specimen peered out of a crack which bounded a slab more than a square yard in area that turned out to be loose. On prising out the slab with an ice axe the whole of the exposed surface was seen to be closely felted over with the root system of a plant that was itself less than 2 inches in the diameter of its tuft of leaves. This is one of the properties of many Alpines which sometimes makes them difficult to manage in the rock garden. *J. R. F., Gerard's Cross.*

ON INCREASED FOOD PRODUCTION.

WEEVILS.

DURING the first spell of dry weather in May my attention was called to Peas that were being eaten by something on allotment grounds in a western suburb of London. Sparrows were blamed, but I could see that the damage was not being done by those mischievous birds, but by an insect pest. However, my shadow was sufficient to make the weevils begin dropping on their backs, feigning death, and I soon found that the culprit was *Sitona crinita*, or the spotted Pea weevil. Other Peas on the grounds were eaten in the same way, and I ascertained that the insects were there in previous years. A few days afterwards I received a boxful of Broad Beans and Peas eaten by the same pests from another part of the country. I note that the modern spelling of *Sitona lineata* (the most widely distributed and common species) is adopted by *G. H. H. W.*, p. 225. All the older authorities quote the names *Sitona lineata*, Linnaeus, and *S. crinita*, Olivier, including John Curtis in his *Farm Insects*. However, the pests are the same. There are some thirteen species that feed on leguminous plants, and four, at least, are harmful to cultivated crops. How to destroy them is the burning question, as expressed by Mr. Beckett, on p. 222, and others. I would suggest arsenate of lead paste for spraying Peas and Beans to poison the weevils. A well-made paraffin emulsion would be safer for vegetation generally than paraffin and water, mentioned on p. 225. Laying tarred boards along either side of the rows overnight or early in the morning, and making the weevils drop on them during the day, would be effective if the Peas were tall enough to shake them over the boards. They were not tall enough for this on the allotment grounds above-mentioned, and this is the stage when the weevils are most harmful. Lines of sand wetted with paraffin, strewn on either side of the rows, would have a deterrent effect. Soot and wood ashes dusted over the Peas on the allotments checked the weevils, and subsequent rains were highly beneficial to the Peas. *J. F.*

I had a fine row of *The Pilot Pea*, about 9 inches high, when weevils attacked the plants, stripping off the foliage. I obtained some soot that had been taken out of the fires three or four days previously (we had been burning logs of wood instead of coal for about six or eight weeks, and that might have made a little difference in the nature of the soot), and dressed the Peas and the ground round about with it. From that day to this I have never seen a single trace of a weevil. A row of second early Peas is entirely free from weevils. On the other side of the first row of Peas there is a row of Broad Beans in full flower, sown the same time as the Peas, and these have never been touched. *H. J. H. Davison.*

THE HARDINESS OF BEET.

MOST of us have considered it risky to leave Beet in the ground later than the end of November, though from the Wisley experience it would seem that much unnecessary labour has been expended (the lifting has to be done in any case, either collectively or as required, in storing the roots in a frost-proof place. Then, again, it Beet is a hardy perennial, why do we not sow the seed during March and obtain the advantages of an earlier crop, and of getting the seedlings safely established before the advent of the general early summer droughts, instead of waiting until the end of April or May? In my opinion, despite the apparently conclusive Wisley experience, and the fact that in my own garden a few roots have safely passed through the severe winter and are now in flower, the answer is that generally Beet is tender. The fact that it has safely withstood prolonged, hard frost merely proves that thirty odd degrees of frost

when the ground and roots are fairly dry, have no ill effects. But those conditions in this country are generally agreed to be decidedly exceptional. In an average winter we are more likely to experience frosts of much less intensity with mild intervals, and when the ground is wet. Under these usual conditions the roots in the ground would be surcharged with moisture and their skins soft. *A. C. Bartlett.*

THE BROAD BEAN.

IT is pleasant for one who has advocated the increased cultivation of the Broad Bean to observe Mr. R. P. Brotherton urge its extended cultivation on p. 222. Many seem to object to its flavour and discourage its growth in their gardens. There is a feeling abroad that it is a "vulgar" dish, and not to be mentioned in polite society! I have had an opportunity of seeing many new allotments this year, and have been disappointed to observe how few Broad Beans are being grown in Scottish allotments. It shows how little the Bean is esteemed in working-class houses, and the few grown in many private gardens show that this is not peculiar to the working housewife. In some parts of Scotland, too, the Broad Bean finds little sale in the shop of the greengrover. *A Scottish Gardener.*

THE LIFTING OF IMMATURE POTATOS.

IN certain quarters fears have been expressed that growers of Potatos this year may lift part of their crops before they are mature. It has been suggested that licences for the lifting of Potatos should be granted after inspection of crops by the local authorities or the Board of Agriculture. The Food Production Department believes that the patriotic commonsense of the general body of growers may be left safely to deal with this question. The suggested licensing would entail much labour, and possibly some irritating interference alike with amateurs and commercial growers. If the committees of gardening and allotment and small-holding societies will make it quite clear to their members that self-interest, as well as the national welfare, demands that Potatos be left in the ground long enough to produce a full crop, no regulation should be required.

POTATOS AND BEET.

THE planting of the Potato Evergood at 5 feet apart and 1 foot between the sets (pp. 181 and 222) opened up an interesting question, since the results obtained were so satisfactory. As the Potatos continued to stand upright, I immediately concluded that the soil was not overburdened with humus, and that the situation was sufficiently open for a free play of air on the haulms. I have seen old and confined gardens overdone with animal manures, and so silt in that old-fashioned varieties of Potatos grow 5 feet to 6 feet long, fell down flat, and produced only few and small tubers. I have always understood that Beet was hardy, and some books, at least, say so. However, many late sowings of Beet have been left in the ground all winter since 1914 induced the practice. Spinach Beet is a common example of the crop being left in the open. Some authorities consider that *Beta maritima* of our sea coasts was the probable origin of Beet and Mangold Wurzel. This is native from the western shores of Europe and Western Asia to India, and must be subjected to severe weather in some of its habitats. Garden practice often makes us forget the hardiness of plants. Like Mr. Divers (p. 222), I believe in storing the juicy-rooted form of garden Beet. I have stored it in sand in a shed where it must often have been frozen, yet the roots remained usable till midsummer or after. I have had to lift lumps of frozen earth 2 feet square in order to get a supply of Jerusalem Artichokes. That would not have answered for Beet, hence the reason for storing it. *J.*

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor.

WINTER GREENS. There is still time to sow in an open position Christmas Drumhead Cabbage for use in January and February. Put the plants out as soon as they are large enough to handle, and they will then be likely to retain their bottom leaves. Plant firmly, and give a good supply of water to settle the soil about the roots. Hardy Green Colewort may also be sown for winter and spring supplies. Savoys and other winter greens should be planted out as soon as the ground is available, allowing plenty of space between the rows. Give a liberal supply of water, and keep a sharp look-out for slugs and other pests. Broccoli should be planted in good time, and at least 2 feet allowed between the rows. The soil for these plants should not be so rich as for early varieties.

SPINACH.—If a cool border is available, a sowing of Spinach may be made every eight days. If the weather continues dry, water will be necessary, freely applied from the commencement. New Zealand Spinach is a good substitute for the ordinary variety, and where there is only a limited supply of water and labour it is the best substitute. It will grow quickly even during very hot weather, and continue to produce a large quantity of green leaves until destroyed by frost in the late autumn. It may be sown now in rows 3 feet apart in rich soil.

LEFKS.—These should be planted in large quantities, if space is available. They should be planted on good soil without any special preparation. Early plantations of Lefks will benefit by a liberal supply of manure water at the roots.

CELERY.—Continue to plant out Celery as the plants become large enough. Do not let them remain in the nursery beds too long, or they will become drawn, and suffer when transferred to the trenches. Give special attention to the watering of Celery during dry weather. Dust lightly with soot in the early morning, to keep Celery fly from the plants, and keep a sharp look-out for slugs.

BEET.—A sowing of Turnip-rooted Beet may be made on rich soil, to furnish roots for use during the winter and spring. Thin the seed lings to 9 inches apart as soon as large enough, and keep the soil lightly stirred with the Dutch hoe throughout the flowering season.

LATE PEAS.—The last sowing of Peas should be made not later than the middle of the month. Sow the seeds thinly in deep drills or trenches, and apply the sticks as soon as the plants are 2 inches high. No earthing up will be necessary beyond drawing a little crumbling soil into the drill to steady the plants until they reach the sticks. Thus the stems of the plants will be rather below the surrounding level, which is much better than drawing the soil up in ridges, which would cast the rain-water away from the roots. As soon as the sticks have been placed in position, a mulching of farmyard manure between the rows will help to retain the moisture in the soil.

POTATOS.—The earthing-up of all main-crop Potatos should be accomplished as soon as possible after the ground has been stirred and all weeds destroyed.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

CATTLEYA AND LAELIAS.—*Cattleya Mendellii*, *C. Mossiae*, *Laelia purpurata* and their many hybrids, are now at the height of their flowering season. Avoid letting the plants "overflower"; a great many are permanently injured by allowing the flowers to remain on them for too long. In the case of plants that are not well rooted, either remove the flower-spikes directly they appear, or cut the blooms as soon as they open. *Cattleya Warscewiczii* (gigas), *C. Gaskelliana*,

C. Warneri, C. Dowiana and its variety aurea, and others which produce their flowers during the late summer, are now making new growths, and should be placed in the warmest and lightest position in the Cattleya house. Give them a more liberal supply of water at the roots, thoroughly soaking the compost through, but allowing it to become moderately dry between each application. A few of the earliest plants will be producing their flower sheaths, but any specimens that do not bloom may be reotted, if necessary, as soon as they commence to root from the current pseudo-bulbs. Use a mixture of Osmunda and Al fibre, with the addition of sufficient crushed crocks to keep the materials porous. Cattleya Mendelii, C. Mossiae, and their hybrids, should be looked over as they pass out of flower, to ascertain if additional pot room or new material is needed. If so, the same mixture may be used. For a few weeks after re-potting careful watering is necessary, and extra shading should be employed. The plants should be sprayed overhead two or three times every day during bright weather.

FRUITS UNDER GLASS.

By JAS. HUDSON, Head Gardener at Gunnersbury House, Acton, W.

PEACHES, NECTARINES, AND PLUMS IN POTS.—These fruits are safely past the stoning period and are commencing to swell again. A little weak stimulant may be given to the roots to keep the shoots growing steadily whilst the fruit is swelling. We expect to gather our first fruits from trees in houses that have been kept quite cool towards the end of the present month. Early Plums have been thinned again, to be on the safe side. I noticed a little red spider on a few of the trees, but the pest was soon checked by syringing with clear water, and as there is no indication of colouring yet the fruits will not be stained. In no case are we hurrying these pot trees, and both the side and top ventilators are kept open at night. At the same time warmth from the pipes is reduced to a minimum.

LATER POT TREES. Plums have set freely on late trees in pots in a cold house, and so far, there is but little evidence of the Plum fly, which will often attack the trees soon after the fruits have set. If this fly threatens to spread we shall syringe freely with Liquid Glis-hurstone. The trees are much crowded, but I hope to be able to afford them more room later. Although Plums will, at a pinch, bear a little more crowding than either late Peaches or Nectarines at this early stage, I prefer to fully expose these trees to light and air from the time of fruit setting onwards. Sea Eagle and the Nectarine Peach, and the Victoria Nectarine, need a long season and plenty of sunshine to ripen their fruits thoroughly.

POT VINES.—Give vines in pots every attention from now onwards. Light, heat and moisture are essential, but I do not advise bottom heat. Pot vines do well standing over hot-water pipes, two bricks intervening between the pots and the pipes. An effort should be made to give the vines a fair chance of making good growth. When any reach to a length of 5 or 6 feet they should be stopped, and then be made to break the main bud at the top. Do not let the lateral growth come away, as this is not good enough.

THE HARDY FRUIT GARDEN

By W. A. COOK, Gardener to the Hon. ARTHUR DAVRY, Abbots Wood, Godalming, Surrey.

OUTDOOR VINES. Vines grown in the open for their fruits should be disbudded carefully, and all shoots which are not required for fruiting or extension removed, rubbing them out with the fingers; pinch any shoots that need stopping. The bunches should be thinned to one on each lateral, which may be stopped at about the second leaf. In training the shoots exercise great care, for they are very tender, and break off at the base in consequence of very little extra pressure. The vines must be kept free from mildew, by the use of a fungicide if necessary. Potassium sulphide is suitable, but it must be remembered that it will cause paint to turn black. If

preferred, flowers of sulphur may be dusted on the leaves, but it is necessary to repeat the application at intervals. Where the roots are growing in dry situations water may be necessary, and should be given copiously when applied at all. Vines are suitable plants for furnishing trellises and pergolas, and if the shoots are trained early in the season not much further attention will be needed.

BUSH AND PYRAMID APPLE TREES.—If black aphid is present on the tips of the shoots, use the syringe or garden engine for spraying with a strong solution of Extract of Quassia. If caterpillars are still present, give a good syringing with Bichu, according to the directions sold with it. This is best applied at night, and the trees should be washed with clear water in the morning. Early Apples which are swelling their fruits should be thinned when set in clusters. Mr. Gladstone, Irish Peach, Lady Sudeley, and Beauty of Both all ripen early. Early Harvest is also a good variety; the fruits attain to a fair size, and the tree is a free grower. Culinary varieties are also the better for being thinned early, especially such large sorts as Lord Suffield, Lord Grosvenor, Frogmore Prolific, and Newton Wonder. Be on the alert for signs of American blight, and if discovered brush the bark hard with a mixture of nicotine soap and petroleum.

TYING AND NAILING.—All kinds of trees are now growing rapidly, and if the stopping and disbudding has been already carried out the remaining shoots should be fastened to the wall or wire in the desired directions. The branches of trees which have filled their allotted space should be stopped, but in the case of newly planted or smaller trees they should be retained their whole length. The points of Cordou Peas and Cherries may be nailed in; the most robust shoots coming from the lower branches should be kept in order to furnish bare places.

STRAWBERRIES. Give the Strawberry plants a good soaking with water or liquid manure, especially in light or shallow soil, before they are netted.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcote, Eastwell Park, Kent.

SOLANUM CAPRIBASTRUM. This popular berried plant is usually much in demand for decoration during the winter months. Plants grown from seed sown, or cuttings struck, during the early spring, will now be ready for the final shift into pots measuring 4½ to 5 inches. If large specimens are required, old plants should be grown on and transferred into larger pots of the size needed. After potting they should be kept under glass till re-established, and then plunged the whole depth of the pot into soil or ashes. Excessive dryness must be avoided, or red spider will attack the plants. Syringe regularly to keep down insect pests, and use clear diluted soot water occasionally for the same purpose.

PREVELLIA ROBUSTA. When in small sized pots, such as 60's or 4's, this species makes excellent little table plants. It thrives under cool treatment, and it can be grown by anyone who has a little glass, and cannot attempt stove plants like Crotons or Dracaenas. The seed may be sown almost any time, but if sown in the early spring the plants are ready by now for potting into the sizes mentioned above, or larger if preferred. If possible, after being potted, the plants should be kept a little closer in the house or frame to ensure a quick start. If checked much they are apt to lose their bottom leaves. Avoid over-watering the plants when they are small, but syringe them freely, and provide shade from very hot sun, in order to keep the foliage fresh and green.

CYCLAMEN LATIFOLIUM. Plants of Cyclamen latifolium should be transferred to their flowering pots without delay, especially if they are required to flower in the autumn and early winter. Use a compost of two parts fibrous loam and one part leaf soil, adding sand, crushed charcoal, and a little dried cow manure. Place the plants in a frame, if possible, not exposed to the full glare

of the sun; in the latter case they would have to be carefully shaded. When the plants are well established and growing freely, the lights should be drawn entirely off at night, so as to give the plants the benefit of the cool night dews. Keep over plants that flowered this season for late blooming next year. Pot them up, and give them similar treatment to that recommended above for seedlings. Sprinkle a little soot over the ashes, and keep the frame damped. Fumigate regularly, to keep down aphid and thrips.

CINERARIAS AND PRIMULAS.—Early batches of Cinerarias and Primulas will now be ready for pricking off into small pots or boxes. The latter are economical when handling large numbers, as the plants can afterwards be transferred directly to their flowering pots. Use open soil, and return the plants when potted to a cool frame, keeping them well up to the glass, but shading them during bright weather. Disperse with the shading in the late afternoon, and draw the lights off entirely on calm nights, to allow the plants the full benefit of the night dews. Sow another batch of each of these, using light, open soil. After filling the pans or boxes, the soil should be watered before sowing the seeds. Press the seed gently into the soil, and cover very lightly; sowing too deeply is a common error. Place the seed pans in a cool frame, and see that they are kept uniformly damp.

THE FLOWER GARDEN.

By W. J. GRISSE, Gardener to Mrs. DUMFRIES, Keels Hall, Staffordshire.

SUB-TROPICAL PLANTS. Plants raised from seed this year should now be in good condition, and may be used in the summer bedding arrangements either as dot plants or for furnishing beds. An open site, but sheltered from north-east winds, should be selected. Such plants as Camia, Ricinus, Wigandia caracasana, Zea japonica variegata, Salvia argentea, Amaranthus caudatus, the Giant Hemp (Cannabis), Nicotiana wigandoides, Perilla nankinensis, Acacia lebanthica, Eucalyptus Globulus, and Solanum, are easily raised from seed, and are excellent subjects for many forms of garden adornment. Other plants that may be used in conjunction with the former are the Japanese Maples, Aralias, Yuccas, Baccopa, Dracaenas, Coleus Verschaffeltii, and Palms. It is advisable to plunge the plants, as they are then better under the control of the grower. Stimulants must be given occasionally, or the plants will soon deteriorate.

THE ROCK GARDEN.—During dry weather do not let the plants suffer for want of water. As they pass out of flower, remove all dead flowers, except from the varieties required to seed, of which the pods should remain until the seed is nearly ripe. Attach a label to each plant for future reference. The strongly growing plants will need cutting back. Place sifted leaf-mould round the base of the plants to conserve the moisture, and a small quantity of some approved fertiliser in the can before watering.

PERENNIALS. Perennials can be sown in drills on an open border, but skeleton frames are better, as they can be covered with any spare lights. Make the seed bed quite flat, and allow a space of 6 to 9 inches between the drills. A thin shading and occasional sprayings with clear water will hasten germination. The following, sown now, will provide good plants by October: Primulas in variety, Pyrethrum, Statice latifolia, Chelone barbata, Heucheras, Delphinium, Aquilegia, Anemone italica, Gallega, Lychnis, and Eryngium. Sow the seed gently and prick out the seedlings directly they are large enough to handle.

SUMMER-FLOWERING CHRYSANTHEMUMS.—Continue to stop the shoots until the end of the present month, after which the plants should be allowed to grow on to the flowering stage. Reduce the number of shoots according to the size of the plant required. Stake each root separately and allow ample space to admit light and air. The flat hoe must be frequently used between the plants, even if there are no weeds. Give water during dry weather and syringe the plants occasionally to keep insect pests in check.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication. or well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 58.5.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, June 14, 10 a.m., Bar, 29.4, temp. 70°. Weather—Cloudy.

Old Seed and New.

It is very desirable that experienced gardeners should do all in their power to assist the authorities in spreading knowledge among amateur cultivators on the subject of seeds. They know the vagaries of seeds, whereas the amateur is apt to regard a seed as the certain progenitor of a plant. The need for general instruction is a very real one, for the world is reverting to its first occupation of gardening. Nowhere is this reversion more marked than in England, although it looks as if America is going to run us very close. Hence there is bound to be a strain on the world's supplies of vegetable seeds.

Even during the present sowing season signs have not been wanting that the supplies of some kinds of seed are deficient, and that some samples contain a certain percentage of old seed.

A striking example recently came under our notice. Parsnip seed was sown a month or so ago, and generated so unevenly as to suggest the advisability of re-sowing. Fortunately, the gardener was wise, and, shaking his head, decided to wait and see. Immediately after he had taken that decision a heavy rain fell, and within two or three days a second crop—no doubt of the older seed—had germinated, and the rows of seedlings were plainly visible and sufficiently thick.

It is the habit of old seed to germinate slowly and irregularly. Such seed finds a difficulty in plumping up. Hence judg-

ment must be exercised both this year and next as to how best to compromise between the need for economy by thin sowing and the need to sow thickly enough to produce sufficient seedlings. In this connection the readiness with which different seedlings may be transplanted must be borne in mind. No doubt most vegetable seedlings may be transplanted if sufficient care be taken, but some survive transplantation better than others. For example, Beet transplants well. Peas are at least, in our experience—lickety; sometimes benefiting by a change of ground, but sometimes suffering severely.

Depth of sowing and planting is also another subject on which professional gardeners can help their neighbours. Some enthusiastic amateurs have this year planted their Potatoes 8 inches deep (in the subsoil), and their Shallots half as deep. These are no doubt exceptional cases, yet errors of lesser degree are bound to be common.

Again, the advisability of "rod-leading" seed apt to be attacked by birds requires to be made yet more widely known. We understand that the authorities are about to issue instructions in pamphlet form on seed economy, and we suggest that the many gardeners who are already giving so much of their time to helping their less experienced neighbours should, when they are issued, secure copies of the pamphlet and see that its contents become widely known. Seed economy might well form the subject of lectures and discussions in local societies during the coming late summer and winter months. By keeping the importance of economy constantly before the minds of users of seed much good can be done. It will encourage them, among other things, to place their seed orders early, and to order no more than they are likely to require, to make judicious use of seed left over from the previous year, and, in the case of such seeds as those of legumes, to save their own seed.

HORTICULTURAL CLUB: ABANDONMENT OF EXCURSION.

The proposed visit of the members of the Horticultural Club to the Wisley Ground, on the 21st inst., has been abandoned owing to unexpected difficulties in the hiring of road conveyances. *R. Hooper Pearson, Hon. Sec.*

R.H.S. TRIAL OF BEETS.—The Royal Horticultural Society is about to carry out a trial of Beets for late-summer sowing and Lettuces for autumn sowing. One packet of each variety for trial should reach the Director, R.H.S. Gardens, Wisley, on or before the 30th inst.

"ROSE ANNUAL FOR 1917."

A perusal of the *Rose Annual* for 1917, issued recently by the National Rose Society, leads to the conclusion that the somewhat apologetic tone adopted in the preface is unnecessary. Although some who have contributed articles in happier times have been on this occasion unable to assist, the *Annual* for the current year suffers nothing by comparison with its predecessors, and contains a series of articles of extreme interest and utility. "Roses for the Back Garden," by Mr. S. ARNOLD; "Roses on Walls," by Mr. EDWIN MANNING; "Roses Near a Manufacturing Town," by Mr.

C. B. WORSEY; "Pergolas and Arches," by Mr. WALTER EASLEY; "Roses in Waterlogged Gardens," by Mr. H. OPPENHEIMER; "Early Roses in Pots," by Mr. H. G. MOUNT—all deal in a practical manner with sections of Rose culture, and cannot fail to be of great assistance to the amateur rosarian. The very able and exhaustive article on "Some Early-flowering Species of Roses," by the Deputy-President of the Society, Mr. H. R. DARLINGTON, has an added value in that it is based on personal experience and keen observation. Two articles of great value—"New Seedling Roses in 1916" and a "Rose Analysis" of the same year—are contributed by Mr. COURTNEY PAGE, the honorary secretary to the Society. These latter give to the reader a survey of the never-ending improvement of the Rose at the hands of the breeder, most useful to those who cannot always themselves see the new Roses, and must be largely guided by the expert advice of those who can. Amongst other articles may be mentioned one by the Rev. J. H. PEMBERTON, who boldly tackles the subject of "Rose Perfumes," a matter wherein personal tastes differ so widely. The *Annual* is well illustrated, and, although colour photographs are absent, the black and white illustrations, accompanied by adequate descriptions, convey very useful impressions of the flowers. The last picture in the *Annual* is reproduced, by permission, from *Punch*, and shows how, even under the trying conditions of the trenches at "the Front," the taste of the true rosarian will assert itself. The National Rose Society may be congratulated on having given to its members an *Annual* which bears testimony to the vitality of the Society, and to the energy and ability of its co-workers, Mr. H. R. DARLINGTON and Mr. COURTNEY PAGE.

GARDENERS' ROYAL BENEVOLENT INSTITUTION (WORCESTER AUXILIARY).—The President of the Worcester Auxiliary of the Gardeners' Royal Benevolent Institution, EARL BEAUCHAMPE, three open his gardens at Madresfield Court, Malvern, to the inspection of the public on Whit Monday, with the object of assisting the funds of the Institution. A sum of about thirty pounds was taken at the gates. The visitors were much interested in the display of flowers in the pleasure grounds. Many of the glass houses are this year being used to grow food crops instead of flowers.

FLOWERS IN SEASON. Mr. W. A. COOK sends flowering shoots of *Halesia tetrapetala* and *Piptanthus nepalensis*. Mr. COOK states that the "Snowdrop Tree," as the *Halesia* is commonly called, is especially fine this season. This specimen was gathered from a tree 40 feet high in Miss GERTIE DE JEWELL'S garden at Munsted, and estimated to be about 35 to 40 years old, the same age as the tree at Leonardlee.

THE USE AND ERADICATION OF BRACKEN.—As is well known, Bracken contains a large amount of potash. Of the dry matter which makes up 9 per cent. of the plant about half consists of sulphate and chloride of potash. In the older fronds the percentage of potash falls from 55 to 40 per cent. According to Mr. BERRY, who has recently carried out experiments on the reduction of potash by treating the ash with water, 70 per cent. of the potash passes into solution. By adding superphosphate of lime to the extracted potash the caustic properties of the latter may be destroyed. Mr. BERRY advises a slow fire for burning, and recommends the cutting of the Bracken at a time when it has reached its maximum growth and the first signs of withering are manifest. From 4.8 acres of Bracken yield 1 ton of ash, the potash in which, at 12s. 6d. per cwt., is worth £25. After deducting cost of preparation Mr. BERRY estimates that a good margin of profit is

* A Report on Bracken Utilization and Eradication West of Scotland Agric. College Bull. No. 80.

left. The crude ash should be put up in bags and stored in a dry place. When used as a fertiliser it must not be mixed with ammonium sulphate. At the present time the use of Baekon for litter is to be recommended very strongly.

IRRIGATION AND FOOD PRODUCTION IN THE STATES.—In the annual Report of the Smithsonian Institution, Washington, U.S.A., there is an interesting article on the reclamation of certain arid districts in the west of the United States by Mr. J. B. BEARD, of the U.S. Reclamation Department. A million and a half acres have, since the commencement of work in 1912, been supplied with water, and the annual product from some of the irrigated lands exceeds the output of some other States with a good natural water supply. The chief crop grown at present is the nitrogenous Alfalfa, but many other plants are being tried, including Soy, cereals (wholly Barley), fruit of various kinds, and the Sugar Beet. Fruit growing is flourishing, and from the Sun-dried fruit as a crop for a million dollars' worth of Apples were produced in 1914.

SUMAC GROWING IN SICILY.—The *Journal* of the Society of Arborescences is interesting in its account of the cultivation of the well-known dye plant *Rhus Coriaria*, which has been used for tanning hides. Two varieties are grown, the wild and the cultivated, the latter being *R. tinctoria*. The plant of Sicily produces colored substances for the dyeing of the cloth, as it grows best on soil of volcanic origin. Such soils, indeed, such that, produces the best and most abundant tannin. The plant is a *Rhus* in general, having 6 inches diameter at the base in January, and the leaves are 24 inches long when they have attained maturity in July and August. They are used for dyeing and tanning of two or three times, 10 lbs. of a bush.

PLANTS IN SEASON.—We have received from Messrs. GEORGE RUSSELL AND CO. a number of bearded Fritses. In London the standards are pale purple, contrasting with the purple falls, and set off by the bright yellow of the beard. Most are a rather small bearded variety, with clear yellow standards and fall, purple falls veined with white. California has large, refined blossoms of bluish mauve, rather darker falls veined with white and brown, and brightened by the touch of yellow provided by the beard. The orient has a *Prince of Empress* is a small, dark purple flower, the base of the falls decorated by a close network of veining, brown and purple-gold. Shilford Chief form is a massive bloom of rich purple, the base of the falls thickly veined with white, and a profuse white and yellow beard.

CHEAP FERTILISERS.—Although crude sewage is not to be recommended for manual use by experienced persons, sewage matter properly prepared is a fairly safe fertiliser which can be utilised advantageously for general farm and garden purposes, especially at the present time, when artificial manures are both scarce and costly. Under the name of "Gum" a good deal of treated sewage matter has been bought by foreign growers, notably those of France and Belgium, for many years past, and lately fertiliser merchants, as well as many market garden growers and a few farmers, have been ready purchasers in England. The sewage of Kingston on Thames and Bradford, among other places, has been disposed of in greater or less degree for some time past for use as manure; and had it not been that the cost of transport brought the price to a figure that was relatively high—as compared with other sources of plant food—doubtless the market would have been wider. For gardeners, amateur and professional, and farmers, within comparatively short distance of a source of supply, sewage fertiliser just now can be obtained at tempting prices. For example, growers in the North who are short of manure may well communicate with

the Town Clerk, Town Hall, Bradford, with a view to securing a supply of the sewage fertiliser of which the town has many thousands of tons ready for sale. The Director-General of Food Production recommends this course; and prompt application is desirable, so that transit facilities may be arranged. The prices charged for Bradford are 6s. to 15s. per ton, according to the content of moisture, and, at these prices, a heavy rate for transit could be added before the fertiliser became uneconomical. The best samples, indeed, on the field or garden, according to an analysis ordered by the Food Production Department are worth about £2 per ton, reckoned according to the familiar system of unit valuation. That is to say, to secure the same amount of plant food in chemical form from other sources, the grower must pay about twice as much as the Bradford Corporation are charging for this sewage fertiliser, which laboratory tests showed to contain phosphate 0.2 per cent., potash 0.6 per cent., and nitrogen 1.5 per cent. The Food Production Department will be pleased to hear from any other informed body or private person holding mineral matters that might be placed at the disposal of agriculturists.

HARVESTING HORSE CHESTNUTS.—A new and important use for a tree long known to Horse Chestnuts, an apple has been issued by the Food War Committee of the Royal Society for the systematic collection of Horse Chestnut during the forthcoming season. Every ton harvested means the saving of half a ton of Mince, and hence the liberation of that quantity of food. Since my country has 17,000 tons a week to be used as a crop that all who can assist in securing the crop harvest will be doing a good deed. In particular gardeners on large estates should be requested to assist in this important work. An arrangement with regard to the organization to be adopted will be made immediately.

TREES AND SHRUBS.

NOTES FROM BALSFORD PARK

During severe winter has imposed a severe test on many tender forms of vegetation in these gardens, and many plants and shrubs have suffered badly.

Some of the Bamboo for which this garden is famous has a row of a dozen and a half specimens. Several plants of *Arundinaria nobilis*, raised from seed by the late Lord Roxburgh some years ago, have suffered severely; most of the tops of these have been killed back, and as far as one can judge at present, only two specimens are likely to recover. A *Leydeberg*, *A. unguis*, and *A. japonica* Metakei are badly cut by the cold winds. I was somewhat surprised to find that the latter had suffered, as I hear that a large clump of this Bamboo growing in a Suffolk garden, close to the sea, is quite unharmed. *Phyllostachys Quiloi* has fared rather badly, and is far from being ornamental at present. *P. aurea* is in much the same condition, and *P. rugosa* (maiflora) has suffered a good deal. *P. arundinularis* is anything but attractive, in spite of its sheltered position, although it has not suffered in previous years.

The variety that looks best of all is *Arundinaria nitida*, which is scarcely any the worse for the severe winter. *P. viridis glaucescens*, *P. fastuosa*, and *P. Hemons* are little the worse, while *P. sulphurea* has come through the winter well, and is a variety worthy of attention.

Among other shrubs that have suffered I may mention *Cistus*, *Chonoxia*, *Buddleia*, and *Berberis Darwinii*, though none of the other *Berberis* is any the worse. Most of the *Buddleias* are breaking satisfactorily from the base, but will soon recover. *Rubus australis*, *Hypericum reptans*, and many of the *Helianthemums* have, unfortunately, been killed outright. The diminutive, but charming, *Rubus arcticus* has blossomed freely, and appears to have enjoyed the Arctic conditions. *Knapfia Northia* is little the worse; young plants have not suffered at all; and the showy *K. erulescens* has come through the winter unimpaired.

The gardens are situated at an altitude varying from 600 to 800 feet above sea level, and the most frost experienced during the winter was 26° Fahr. *J. Gardner, Balsford Park Gardens, Morston-in-Marsh.*

THE HARDY FLOWER BORDER.

MYOSOTIDÆUM NOBILE

Very great interest has been evoked by the free flowering* of a group of this interesting plant in the gardens here on account of its rarity on the East Coast, though not uncommon in Galloway and other warm spots in the west of Scotland. One lot planted on a rocky wall, however, all but completely destroyed by the severe January frost, those that escaped and flowered being in a sheltered position in the kitchen garden. I raised the plants from seeds produced by a plant in a pot a few years ago, and a various coloured lot resulted, from whitish almost to turquoise blue. All are lovely. *R. P. Brotherton, Tynninghame, East Lothian.*

MECONOPSIS SIMPLICIFOLIA.
BAILLEY'S VARIETY

My plant of Bailley's variety of *Meconopsis simplicifolia* has again opened its lovely, pebble flowers, which are fully 4½ inches in diameter, on a 15 inch stem. This is an original plant raised from seed given to me by the late Colonel Bailley, the father of the hybrid, and there are still some half dozen plants of the same batch yet to flower.

I hope, contrary to the usual habit of these Eastern *Meconopsis*, that this one will, in favourable circumstances, prove perennial, as the two plants that flowered last year have grown into big clumps, and, though not showing signs of flowering at present, may do so later, and will certainly flower next year if alive. These plants are all in their original seed bed under a north wall, and have had no protection. One plant from the same batch has a large flower of a good lake colour (not the usual dirty red lilac), with deep blue rays at the base of the petal, and a good thing, though not comparable with the lake blue relative, *Lichadd*. *Buchan Hepburn Swinton, East Lothian.*

FUCHSIA SPLENDENS.

This pretty and distinct species of *Fuchsia* (see fig. 35) is far less frequently met with in gardens than it was 40 to 50 years ago; indeed, it seems to have almost dropped out of cultivation. The plant is of free growth, and if allowed space for its development, will form a good sized bush, though effective specimens may be grown in pots eight inches in diameter. The

leaves are heart-shaped, hairy, and of a pale-green tint, while the flowers are in shape more suggestive of a Correa than a Fuchsia. The tube, which is somewhat inflated, is of a bright crimson colour, while the sepals, which do not reflex, are green. This Fuchsia should be well exposed to the sun in the latter part of the summer and in autumn, in order that

have never succeeded. It was, therefore, with great interest that I noted a variety under the name of Benita at one of the spring meetings of the Royal Horticultural Society in 1912, the exhibitors being Messrs. W. H. Rogers and Son, Red Lodge Nursery, Southampton. The novelty was said to be the result of a cross between a Continental variety—Gartenmeister Bonstedt—

scarlet. Several other species of Fuchsia are well worth cultivating, and they form pleasing subjects for the greenhouse. I refer to Fuchsia ampliata, F. microphylla, F. thymifolia, the curious F. excorticata, and F. procumbens from New Zealand. The blue and yellow in the flowers of this creeping plant give it a quaint appearance, and in addition to its

FIG. 95.—FUCHSIA SPLENDENS: FLOWERS BRIGHT CRIMSON.

the wood may be thoroughly ripened. When subjected to a temperature above that of an ordinary greenhouse, it will flower early in the year, but it is particularly effective when allowed to develop naturally. This species does not continue flowering throughout the summer as many garden varieties of Fuchsia do. I have, time after time, tried to cross *F. splendens* with other species, and also with garden varieties, but

and *F. splendens*. I had no doubt, judging by the appearance of the plant, that the last-named was one of the parents. In the variety Benita the flowers, which are borne in great profusion at the ends of the shoots, are about one inch long, and hang suspended by pedicels of the same length. The stout tube of the flower, which, however, never reflexes, is of a rosy scarlet colour, while the petals are of a bright orange

flowers the bright cherry-like fruits are very attractive. Then there are the large showy kinds, such as *F. fulgens*, *F. boliviana*, *F. corymbiflora* (and its white variety, *alba*), and *F. serratifolia*. As a roof plant for a fair-sized structure, *F. dependens* is particularly suitable, while the distinct coloured *F. triphylla* deserves mention, not only for its own intrinsic merit, but also for its value to the hybridist. W. T.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

AZOLLA CAROLINIANA (see p. 235).—With reference to the discovery by Mr. Stansfield of *Azolla caroliniana* in the neighbourhood of Preston, I may say that some years since I saw ponds of some considerable size a few miles out of West Cork, in which the plant had established itself. The growth covered every square inch of the surface with a blanket of some depth. As there are many gardens in the neighbourhood, I have no doubt that it was an escape. Should the plant spread through the country, it is just possible that it might become as great a nuisance in ponds and ornamental waters as *Elodea canadensis* (another American aquatic) did some years since. W. F. Ginn.

PEA WEEVIL (SITONUS LINEATUS) (see also p. 242).—It may interest your correspondent G. H. W. to know that I have found the following specific infallible remedy for Pea weevils: Spray the plants directly they appear through the ground with a mixture of 3 oz. of liver of sulphur to 1 gallon of rain-water. Repeat the spraying every other evening for one week. J. D. Shalstone.

DAMAGE TO LIME TREES BY FROST.—A remarkable effect of the severe frost is seen in the Lime trees, the growths of last year being killed. We experienced a severe blizzard here previous to the frost, which damaged many evergreens, but every part of the Limes, whether exposed or sheltered, is injured equally. One can only regard the damage as the effect of extreme cold on growths which had not matured sufficiently in the previous season. R. P. Brotherton, Tynningham, East Lothian.

GOVERNMENT OFFERS FOR FRUIT. Although no official notice on the subject has been published up to the time of writing, it is announced in the papers that offers of certain varieties of fruit for jam for the Army have been made to salesmen, who have been instructed to secure contracts from growers at certain prices, which may, however, be modified. The prices named are £18 to £20 per ton for Gooseberries, £50 to £32 for plumped Strawberries, £26 to £28 for Strawberries on stalks, £35 to £37 for Raspberries, £40 to £42 for Black Currants, and £10 for Victoria Plums. The higher prices, it is stated, are for fruit delivered at jam factories in growers' empties. The higher price for Gooseberries is equivalent to 5s. per half-sieve of 23 lb., which is better than peace rates for fully-grown fruits, though only about half the current price in Covent Garden. For Black Currants the higher price is equivalent to 9s. per half-sieve of 24 lb., which is below last year's average in London. For Victoria Plums the offer is only 2s. 6d. per half sieve of 23 lb., or no more than an average peace time rate. Southern Grower.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JUNE 5, 1917.—*Present*: Mr. E. A. Bowles, M.A. (in the chair), Messrs. J. Fraser, W. C. Worsdell, J. W. Odell, H. J. Elwes, W. J. Bean, and F. J. Chittenden (hon. secretary).

Many flowered Tulips.—Mr. W. C. Worsdell remarked upon the branched Tulips shown at the previous meeting, which are common especially among Darwin varieties in many gardens, that the many flowered condition arose from adnation of branches, not from fasciation, as might appear probable from the external characters of the growths. He drew attention to the occurrence of branching in some species, as in *T. biflora*, *T. saxatilis*, and *T. praestans*, and Mr. Bowles remarked that it seemed to be a primitive condition.

Cup shaped Leaves.—Mr. Fraser showed a "blind" Cauliflower in which a leaf had assumed the form of a cup. This is not uncommon in Cauliflowers, and is associated with the occurrence of a leaf at the tip of a shoot where it takes the place of a terminal bud. Mr. Anstis sent a similar growth in *Aucuba* from his garden at

Birmingham, where the leaf formed a cylinder nearly 2 inches long before the free parts of the two leaves which formed the cup were reached.

***Lygus terminalis*, etc.**—Mr. J. Fraser showed a series of specimens which he had collected in various localities, mostly on the Surrey downs, of *Pygus terminalis*, *P. intermedia*, and *P. latifolia*. He and other members of the Committee remarked upon the possible hybrid origin of *P. latifolia* and *P. intermedia* and the possibility that birds had carried the seeds of some of the forms from neighbouring gardens to apparently wild localities, where Mr. Fraser had found the trees growing.

Various Plants.—Mr. H. J. Elwes showed a series of plants from his garden, including *Paeonia Emodi*, *P. albiflora*, *P. Broteri* from Portugal, a bright, light form of *P. lobata* in variety of *P. officinalis*, and *Polygonatum verticillatum*, which he had collected many years ago in Perthshire. He also showed a large, dark form of *Camassia*, probably a seedling from *C. Leichtlinii*.

MANCHESTER AND NORTH OF ENGLAND ORCHID

MAY 10.—*Committee present*: The Rev. J. Crombholme (in the chair), Messrs. R. Ashworth, D. A. Craven, J. C. Cowan, Dr. Craven Moore, J. Cypher, A. G. Ellwood, J. Evans, P. Foster, A. R. Handley, A. Hamner, F. Houghton, J. Lupton, D. McLeod, H. Thorp, and H. Arthur (secretary).

AWARDS.

FIRST CLASS CERTIFICATES

Odontoloba Prince Albert (Olm Zephyr), a fine colour and well broad, well set flower of even colour and well broad, flat lip; *Odontoglossum crispum King*, a large flower, heavily blotched with deep crimson on a white ground, both from Dr. Craven Moore.

Odontoloba sum. crinitum (Margaret), a fine flower with heavy and even markings of a deep warm shade, and *Odontoloba Bradshawiana* (Arce), both from P. Smith, Esq.

Odontoglossum crispum Hilde, a large flower, one of the best of the white ground type, from W. R. Lee, Esq.

Oncidium superbiens (Bronze King), a flower of deep bronze colour, from Mr. J. Evans.

AWARDS OF MERIT

Odontoloba St. Francis (O. *scholastica* *nuttalliana*), *Olm Adriaens*, and *Odontoloba Bleuma* (P. *textum*), both from R. Ashworth, Esq.

Odontoglossum crispum Mantlar, from Mr. J. Bolton, Esq.

O. leucopurpureum, from Dr. Craven Moore.

O. Leucum (Olm *Collyea*), *Olm Rouge* (Drapon), from W. R. Lee, Esq.

Cattalia Mendly (Fair Queen), from Mr. J. Birchenshaw.

The annual meeting of the Society was held at 2.30 p.m., the Rev. J. Crombholme presiding. The report and balance-sheet were adopted. R. Ashworth, Esq., was re-elected president. The vice-presidents, officials, and committee were all re-elected.

The prizes were presented to the successful exhibitors as follows: *Mr. Ashworth's Silver Cup* to Dr. Craven Moore; *Mr. J. J. Bolton's Gold Medal* to the Rev. J. Crombholme; *Gardener's Prize* to Mr. E. Marshall; *Mr. Bolton's Silver Cup Medal* to R. Ashworth, Esq.; *Gardener's Prize* to Mr. S. Davenport and Mr. W. Gilden; *Botanic Society of Manchester's Gold Medal* to Mr. E. Rogers; *Mr. J. B. Handley's Prize* to Mr. C. Branch; *Messrs. Charlesworth and Co.'s Objay d'Art* to Dr. Craven Moore; *Gardener's Prize* to Mr. T. Arran; *Messrs. Cypher's Gold Medal* to R. Ashworth, Esq.; *Gardener's Prize* to Mr. S. Davenport and Mr. W. Gilden; *Mr. J. Hamner's Silver Cup* to R. Ashworth, Esq.; *Gardener's Prize* to Mr. S. Davenport and Mr. W. Gilden; *Messrs. McBean's Silver Trophy* to Dr. Craven Moore; *Gardener's Prize* to Mr. T. Arran; *Mr. P. Smith's Prize, 1st*, to Mr. S. Davenport and Mr. W. Gilden; *2nd*, to Mr. T. Arran; *3rd*, to Mr. E. Marshall.

KEW GUILD.

JUNE 2.—The annual meeting of the Kew Guild was held in the lecture room at the Royal Gardens, Kew, on the 2nd inst. Mr. Chas. H. Curtis, the president for the year, presided. Many old Kewites sent letters, expressing their regret that war-time conditions prevented them from being present; many are on active service, including Capt. Hugh Pettigrew, who is now "Somewhere in France." Mr. A. Hill was unavoidably absent, and the meeting was also notable for the absence of young men practically all the young men on the garden staff at Kew are on active service—and the presence of many of the young women who are now working in the gardens.

Reference was made to the many losses by death, and the work of the Benevolent Fund. Old Kewites will be glad to hear that Mr. W. Crisp is being assisted, but will be sorry to learn that he is gradually becoming weaker. The Guild has a sum of £325 invested.

The President, in moving the adoption of the report, suggested that some form of memorial should be raised at the end of the war to commemorate those Kewites who had taken part in the war. Mr. J. Weathers, Mr. Halses, Mr. W. Goldring, Mr. Whipps, and Miss Joshua spoke on various subjects, and it was arranged that next year a meeting of present Kewites should be called so that the ladies should have an opportunity of nominating a candidate for a seat on the committee.

Messrs. Osborne and Combs were re-elected secretary and treasurer respectively. Messrs. T. W. Brown, S. A. Skan, H. Spomer, A. Monbissier, and M. Free (the latter nominated by the Association of Kew Gardeners in America) were elected members of the committee, with Messrs. J. Clark and D. Halkerton representing the present staff. Messrs. W. Halses and J. Aikman were appointed auditors for the ensuing year. Greetings were sent to the American Association of Kewites, and also to Mr. G. Neville and Lt. Deswick, prisoners in Germany. A fund was opened for the purpose of sending food and comforts to members who were prisoners of war.

Obituary.

FREDERICK BURVENICH.—It is with deep regret that we receive the news of the death of Monsieur Fred. Burvenich, who died at Ghent on March 27 last. Burvenich occupied a prominent position in Belgian horticulture, having laboured at the Ghent School of Horticulture for many years. His close connection with the Quinquennial Exhibition at Ghent gave him world wide fame, and he was well known to the numerous English horticulturists who visited these Exhibitions, and from time to time enjoyed his profuse hospitality. M. Burvenich was born in 1837. At fifteen years of age he entered the nurseries of Louis Van Houtte, where he was apprenticed. His soon gave evidence of unusual skill and industry, and he also devoted himself to botanical studies. In his twenty first year he was appointed Professor of Fruit and Vegetable Cultivation at the Horticultural School at Gentbrugge, which was subsequently taken over by the Government and removed to Ghent. M. Burvenich soon became famous as a lecturer. Indeed, he was the most popular lecturer in Belgium. Every Sunday hundreds of people from all corners of Flanders Belgium crowded to the school, to hear his lectures on various horticultural subjects. Three of his contemporaries were Edouard Pynaert, E. Rodigas, and H. J. Van Hulst. These four friends did more than any other men to disseminate knowledge of plant cultivation throughout their country; and it is mainly due to their efforts that Belgian horticulture was brought to the high standard to which it had attained previous to the war. The little company of four enthusiasts was often likened to "the four leaved clover." Three of the leaves, alas, have long since fallen, and now the stem is bare. M. Burvenich was the author of many works on horticulture and allied subjects. His book on arboriculture, in Flemish

and French, ran through a large number of editions. His work on vegetable culture was also exceedingly popular. He was the founder of three journals, *Revue de l'Horticulture Belge et Étrangère*, *Bulletin d'Agriculture*, and *Tydschrift over Boerenteelt*. Much of his spare time was devoted to a nursery which he established near Ghent. He was a prominent member of the Société Royale d'Agriculture et de Botanique de Gand and of the official Belgian Horticultural Council. In both capacities, and in spite of his great age, his vast experience enabled him to render valuable service. In July, 1908, he attained his golden jubilee as State lecturer, and his friends presented him with a testimonial. He was also nominated by the King Chevalier de l'Ordre de la Couronne. The last Quinquennial Exhibition, which took place in 1913, was designed by Monsieur Burverich, and those of us who had the privilege of visiting Ghent on that occasion will recall the beautiful effects which were the result of his skill and experience.

It is to be specially regretted that our old friend has been called to rest whilst his loved city of Ghent is still occupied by the invading army.

CROPS AND STOCK ON THE HOME FARM.

DAIRY COWS AND PLOUGHING UP OF GRASS LAND.

In some counties there seems to be an idea that dairy cows and other cattle can only be kept when large areas of permanent grass land are available. At a recent meeting of the Essex War Agricultural Committee, various estimates were given of the number of acres of grass land necessary for each cow when the produce of arable land was used to help with their keep. It was stated that two acres per cow were desirable. The Hon. E. G. Strutt said that he found one acre per cow quite enough. Mr. Currie, who farms for cow-keeping, thought three-quarters of an acre sufficient. These opinions of practical agriculturists show what can be done with arable land. It must not be forgotten that the total food production of arable farming may be about four times as much as that from the same area of permanent grass. By ploughing up grass, the same number of cows might be kept, and a large surplus of grain food for human consumption grown as well. Dairy farmers need not fear the new three million acres of ploughed land, when labour and horses and machinery are guaranteed them.

HAYMAKING.

The recent rains have brought on the various hay crops so well that the season is now not far short of normal. The method of haymaking varies according to the locality. In the Southern Counties a start is usually made with yellow Trefoil (Hop Clover), mixed with Hampshire or Devon Bents or Italian Rye grass. In other districts Sainfoin is the first to be cut. It is not wise to allow either of these to be too old before cutting. Especial care is required in harvesting Trefoil, as, during dull weather, although the bulk appears to be thoroughly made, the Trefoil "goes back" during the night with heavy dews, and if carted before it is again dry there is a risk of its heating in the rick. Sainfoin should be cut when the blossoms are three parts expanded, or earlier if it is mixed with grass.

Machinery now plays a conspicuous part in hay making. There are many types of grass cutters; the main point in purchasing one is to secure the lightest running movement combined with efficiency. Some farmers use machines with a 6-foot cut, but where the crops average about two tons per acre a 5-foot machine is wide enough.

Swath turners save much labour. A boy with a stout cob in a Martin swath turner will turn twenty acres of Sainfoin or Clover in a (fairly long) day, and more efficiently than by hand labour. A side rake, too, is an excellent aid; not only does it turn the hay, but it collects two swathes into one, and rakes the ground clean. Where much meadow or park grass is grown the American "Vicker" is useful, which scatters the grass evenly, leaving it light. This should

follow close on to the cutter, as the sooner meadow grass is made into hay the better.

Then there are "sweeps," which collect and convey the hay to the ricks. If the ricks can be built in the field, wagons or carts can be dispensed with altogether. If not, self-loaders attached to wagons load the hay very quickly. Large ricks should be built with the aid of an elevator, driven by an oil engine or horse. To clear the field, there are horse rakes—much more economical than hand drag rakes. Of these there are many types, of which a very good one is the Howard.

In favourable weather Sainfoin and Clover should not be turned more than once; the oftener it is handled, the greater is the loss of leaf, which diminishes the quality. It is a mistake to dry hay too much; hay which does not heat at all in the rick is not good in quality. Some persons favour the building of small ricks. I prefer one of 20 tons. It is economical to build and thatch, and there is very little waste at top, bottom and sides. The shape of a rick is an important matter. Do not build too flat in the roof, which encourages moisture under the thatch and spoils several inches of hay. The Hertfordshire fashion of a sharp-pitched roof has much to recommend it. Directly a rick has settled down, the sides should be tucked and shaped, and the roof made up with the tuckings, which should be raked down quite smooth to ward off rains until the whole has settled sufficiently for thatching. When the first swathing has taken place, thatch the rick thickly at once, as a safeguard from heavy rains. Where obtainable, Dutch barns are a boon, saving labour in many ways. Into these the hay can be carted a little at a time when ready, and with safety. *E. Molyneux, Swanmore Farm, Bishop's Waltham, Hants.*

THISTLES IN CORN.

From many quarters come reports of the abnormal quantity of Thistles in the cornfields this year. Thistle-spraying is work within the capacity of women and children, and the utmost possible use should be made of this source of labour. Farmers who have difficulty in getting the necessary help should at once write to the Secretary of the County Agricultural Executive Committee.

There are several reasons why farmers should spend Thistles in their Corn as soon as possible. One of them is the special need of providing this year the maximum yield of grain, which cannot be done on Thistle-infested land. Another is the necessity for saving labour later on, particularly in view of the likelihood of the farmer having to take a second crop of Corn from the same field. Again the stocks of hay in the country are small, and may be smaller next winter and spring, and the supply of concentrated feeding stuffs is also short. Therefore, more straw than usual will have to be used for the feeding of stock. Apart from all these points, there is the further circumstance that not only will much of the forthcoming hay crop be required for the Army, but much straw as well.

ANSWERS TO CORRESPONDENTS.

ACTINIDIA CHINENSIS. *W. J. P.* This climber was only introduced to cultivation in 1900, but its flowering has been recorded on several occasions in these pages; the first time it bloomed in England was in June, 1909. In *Gard. Chron.*, Sept. 20, 1915, Colonel Mainwaring Jackson records a plant as flowering in his garden at Tedsmore Hall, Oswestry, Shropshire. Your specimen, about four years old, has flowered two years earlier than Col. Jackson's plant, which was six years old. **ADDRESS:** *A. P. M.* The secretary of the Gardeners' Royal Benevolent Institution is Mr. Geo. J. Ingram. The official address is 92, Victoria Street, S.W. 1.

A "SHAKESPEARE" GARDEN. A "Shakespeare" garden denotes one in which are flowers mentioned in Shakespeare's works, such as Pansy, Pansy, Rue, Heliozela, Crocus, and Columbine. The most complete list is found in Canon Ellicombe's *Plant Lore of Shakespeare*. The garden should be of a formal character, if possible square, with a roughly flagged space in the centre, and a sundial.

BEE SWARMING. *J. K.* When bees swarm it is usually an indication that the colony is strong and in good health. But swarming is no proof that the bees are free from Isle of Wight disease, and they might contract the complaint at any time, although the present fine weather is conducive to good health.

MOTH. *H. M.* The moth you sent us is the Privet Hawk Moth (*Sphinx Ligustri*). The caterpillar feeds on Lilac, Privet, and other plants. The perfect insects usually appear about midsummer, so that your specimen is rather early. In August and September the caterpillars are very common; they are handsome, the colour being delicate green, with pale mauve and white markings.

NAMES OF PLANTS: *J. T. S.* 1, Too withered to identify; 2, *Cornus alba* var. *Spaethii*; 3, specimen missing; 4, *Helianthemum foetidum*; 5, *Cornus alba*; 6, *Lonicera sp.* (send when in flower); 7, *Deutzia Lemoinei*; 8, *Viburnum Opulus*; 9, *Spiraea discolor*; 10, *Indigofera Gerardiana*.—*T. Barry.* *Salix phylicifolia*.—*Beech.* 1, *Staphylea colchica*; 2, *Ulmus montana*; 3, *Syringa Emodi*; 4, *Quercus flex*; 5, *Kerria japonica* var. *fore pleno*; 6, *Cryptomeria japonica*.—*J. H. S.* 1, *Euonymus europaeus*; 2, *Rhus Toxicodendron*; 3, *Syringa japonica*.

PEACHES DROPPING. *A. T.* The most usual cause of Peach fruits dropping after they have grown a little is the difficulty of forming stones. If you cut in half some of the fruits which have dropped you will probably find no trace of a stone, and this may be due to a lack of lime in the soil. The fruits may drop from other causes; any cultural defect, such as too much moisture or too little, may have a similar result. A check sometimes operates in this way, as, for instance, when too much pruning is done at one time, or when a cold draught is allowed to reach trees that are being forced.

POTATOES. *E. C.* With regard to wireworm, as you will be ploughing up the old pasture in the autumn, you had better dress the ground immediately after the ploughing with gas lime. This is the best remedy for the pest, but cannot always be adopted, as the ground must be left fallow for at least six weeks or two months after gas lime is applied. For spraying the Potato plants, the best material to use is the Bordeaux Mixture. The first spraying of main crop varieties should be done early in July, and a second at an interval of a fortnight. If you buy the specific from your sundriesman ready made you will find directions for strength with the packet; there are many formulas, all slightly differing. You do not say what caterpillar it is which is attacking your trees, but you will find in our last issue (p. 229) an article by *Southern Grower* on this subject, which includes directions for spraying. If you have not got a sprayer, you may be able to obtain one at cost price from the Food Production Department, 72, Victoria Street, S.W. 1.

RED SPIDER ON CARNATIONS. *H. B.* Red spider is not a difficult pest to combat in plant houses. Its presence is a sure sign that the house is kept in too dry a condition. Spraying the plants with clear water and damp the floor and stages. In order to get rid of it now, spray the plants with a solution of half an ounce of common salt to one gallon of water, as often as necessary, until the spider disappears. Afterwards repeat the operation once in three weeks as a preventive measure.

WEEVILS ON NECTARINES. The insects you send us are black weevils (*Othiorhynchus nicipes*). They are exceedingly prevalent this year, probably owing partly to there not being so many small birds as usual. An illustration of these insects was given in the issue for April 28 last, p. 173, with directions for catching and destroying the pest.

MARKETS.

COVENT GARDEN, June 15.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their prices, including Aralia Sieboldii, Asparagus plumosus, Aspidistra, Cacti, Calceolaria, Cocos Weddelliana, Crassula, Erica, Ficus, Geonoma, and various cut flowers like Carnations and Cornflowers.

Prices of all are much lower. Lobelia are also cheaper, but the price of Iris remains firm. Bunches of the long variety from France are much affected by the long journey in hot weather, and are practically unsalable when they reach the market. Sweet Peas are becoming more plentiful, and consignments of the early grown sorts arriving in good condition. Little change is noticeable in the quality of Roses and Carnations, good blooms of Roses are still difficult to obtain. Lily of the Valley is practically over for the time being. Small consignments of white Stock (after Majesty) and Carnation Mrs. S. White are available.

Vegetables: Average Wholesale Prices

Table listing vegetable prices, including Asparagus, Beans, Beetroot, Broccoli, Cabbage, Cauliflowers, Cucumbers, Garlic, Horseradish, Lettuce, and Mushrooms.

Fruit: Average Wholesale Prices.

Table listing fruit prices, including Almonds, Apples, Dates, Figs, Grapes, Lemons, Melons, Nectarines, Nuts, Oranges, Peaches, Strawberries, and Tomatoes.

CLIMBING PLANTS

(Present Day Gardening Series) By WILLIAM WATSON. (Introduction by William Robinson.) A Practical Handbook on the Treatment of Climbing Plants, both hardy and tender species. Illustrated with 24 full page plates, 8 of which are reproduced in colour. Price 2/10 post free from: THE PUBLISHING DEPT., "GARDENERS' CHRONICLE" OFFICES, 41, Wellington Street, Covent Garden, W.C.2

THE ONLY DIRECTORY OF GARDENS AND GARDENERS.

The Horticultural Directory and Year Book for 1917 is the ONLY Directory that exists of gardens and gardeners in the British Isles.

If you want a list of all Nursermen and Seedsmen, Sundriesmen, Hot-house Builders and other traders closely connected with horticulture, consult the ONLY Horticultural Directory.

Should you desire to trace the whereabouts of the young men you associated with in the Bally you have no other means of finding out their present addresses than by turning to the ONLY Directory of British Gardeners.

Obtain a copy and see if your own name is there, and if it is not, then send us particulars for inclusion in the edition for 1918.

The Year Book part of this unique volume contains descriptions of all the new plants, flowers and fruits certificated in 1916, notes on the principal gardeners who died during that period, and much additional information of great value to all amateur and professional horticulturists.

We are still able to offer some few copies of the current number. Readers are advised to send their orders early, before the work is out of print.

Apply, enclosing 1/4 for each copy required, to: GARDENERS' CHRONICLE, LTD., 41, WELLINGTON ST., COVENT GARDEN, LONDON, W.C. 2.

REMARKS: There is a further increase in the supply of Cornflowers, Delphiniums, Gypsophila, Nicotia, double and single Pyrethrum, white Dahlias and

BUSINESS METHODS. Experience in the world of commerce shows that there are two ways of conducting a business, the one being to charge as much as possible for what is sold, exacting a high rate from one customer and a low price from another, and the other to have a fixed price for everything and stick to it. The first method is to be condemned from every point of view, but mainly because it punishes the best purchasers, those who are ready to pay what is reasonably asked when the goods are marked in plain figures. The "Gardeners' Chronicle" adopts the alternative. It guarantees that its advertisement rates are not inflated for any customer, big or little, old or new, and will pay the same price for a similar thing. Conversely, while it is not possible to grant concessionary rates, nevertheless the privilege of the paper to be in the position to assure each advertiser that he pays no more than anyone else.

TRADE.

WANTED, Representative for leading firm of Salsolium amongst Market Gardeners, South-West of England, state qualifications, salary, &c.; must give "SEEDS," Box 9, 41, Wellington Street, Covent Garden, W.C.

WANTED, Hardy Plant PROPAGATOR, in good Nursery, near London.—Write, stating full particulars, W. B., Box 2, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, Hardy Plant PROPAGATOR, in good Nursery, near London.—Write, stating full particulars, W. B., Box 2, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, a CUCUMBER and TOMATO GROWER, good wages and overtime. Apply to J. M. LEATHER, East Fields, Mitcham.

WANTED, GROWER; used to Ferns.—F. T., Box 24, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, GROWER; nursery, 2 1/2 acres, 7 Glass Houses, Cuckfield, Tunbridge Wells, Kent, England. Apply to Messrs. W. Lambert, Rayners Road, North Wood, Kent.

MARRIED MAN wanted for NURSERY, 1/2 acre, 1000 sq. ft. of glass, and 2 1/2 acres of land. Apply to J. M. LEATHER, East Fields, Mitcham.

WANTED, Nursery Order and Correspondence CLERK, in 20 acres of London. Apply to J. M. LEATHER, East Fields, Mitcham.

AUDIT OF CHECKING CLERK (expert) (mostly women), using the quick and accurate, TIDGOLD & SOYS, The Kings' Session, Southampton.

BOOK KEEPER wanted, to take charge of accounts, one used in general Nursery, worked over military. State particulars of position and salary required, to P. M., Box 41, Wellington Street, Covent Garden, London, W.C. 2.

WANTED, for Farm Seed Warehouse, a capable FOREMAN; must be able to superintend clearing and despatch of orders for a wholesale trade, also Washington, must speak English and French; indispensable for Garden Seed Department; an experienced Hand, must be able to take orders large. Good wages offered. All applicants must be intelligible. A. R., Box 19, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, at once, for Work's Food Production Scheme, STOREKEEPER, with good capacity of Nursery and Market Gardening. Good wages offered. State particulars of position and salary required, to P. M., Box 41, Wellington Street, Covent Garden, London, W.C. 2.

WANTED, for retail business, EXPERT SERVICEMAN, with good general knowledge of Seeds and Horticultural Supplies, and good handwriting. Full particulars as to experience and wages required. KING'S VINE NURSERY, LTD., Bedford.

WANTED, WAREHOUSEMAN for good nursery near London, with some knowledge of the handling of Bulbs and of packing. Apply, stating full particulars, N. B., Box 25, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, SHOPMAN for Seedsmen's and Florist's shop. W. B. SMILE, 31, Fleet Street, Tottenham.

WANTED, several WOMEN GARDENERS for Market Nursery, Tomatoes, Chrysanthemums, and Roses grown; good wages and overtime. Apply, SAMPFORD & ALLMAN, Waltham Abbey, Essex.

YOUNG LADY required as IMPROVER in our Cut Flower department. Apply, stating age, experience, and wages required, to WILKS & SEAR, Royal Exotic Nursery, 10, Duke of Devon, South Kensington.

SITUATIONS WANTED.

Twenty-six words for 1/6, and 6d. for each succeeding Eight words or less.

Gardeners desiring their Advertisements repeated must give full particulars, otherwise no notice will be taken of their communications. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. On no account should they enter into communication with unknown correspondents who require a fee beforehand.

Advertisers are cautioned against having Letters addressed to Initials at Post offices, as all Letters so addressed are opened by the Postal Authorities and returned to the Sender.

PRIVATE.

HEAD GARDENER, 25 years' practical experience, 2 1/2 acres, 200 sq. Yards, Pootles, Merton, London, London. Apply to W. LAMBERT, Rayners Road, North Wood, Kent.

HEAD GARDENER, expert in every branch of Horticulture, and estate management of 100 acres. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (HEAD WORKING), 6-10 hours' work, 1/2 acre, 1000 sq. ft. of glass, and 2 1/2 acres of land. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (HEAD WORKING), where 2 on 1/2 acre, 1000 sq. ft. of glass, and 2 1/2 acres of land. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (HEAD WORKING) of good SIX 1/2 acre, 1000 sq. ft. of glass, and 2 1/2 acres of land. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (HEAD WORKING), where 2 on 1/2 acre, 1000 sq. ft. of glass, and 2 1/2 acres of land. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (HEAD WORKING), age 45, 10 years' experience in Grass, Fruit, Flowers, and Vegetables. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (HEAD WORKING) in charge of 100 acres, 1000 sq. ft. of glass, and 2 1/2 acres of land. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (HEAD WORKING) of GARDENER BAILEY, well up in all requirements of 2 1/2 establishments, thoroughly experienced, both Out and Under Glass; also landscape work; excellent references. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (SINGLE HANDED); good with a 2 1/2 acre, 1000 sq. ft. of glass, and 2 1/2 acres of land. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (SINGLE HANDED) in charge of 100 acres, 1000 sq. ft. of glass, and 2 1/2 acres of land. Apply to J. M. LEATHER, East Fields, Mitcham.

GARDENER (SINGLE HANDED); life experience in all branches, Inside and Out; Chrysanthemums, Roses, Carnations, &c.; Decorator; intelligible. Single state wages. GARDENER, Sutton Green, near Guildford.

LADY GARDENER seeks post in good establishment, experienced in Fruit and Plant houses, age 42, single, willing. Manchester district. Particulars, MISS BAILEY, Edin., Hurst, Park, Wincoburgh.

TWO LADIES, experienced (trained under Head Gardeners) aspire to work together in large, up-to-date Fruit and Vegetable Garden. G. T., or MRS. WARRING, 52, Houghton Square, Bickenhead.

TRADE.

MANAGER, Grapes, Tomatoes, Cucumbers, and general market stuff, life experience—H. S., Box 25, 41, Wellington Street, Covent Garden, W.C. 2.

FOREMAN (WORKING); over 30 years' experience wholesale and retail markets, nurseries, and up in Chrysanthemums, Tomatoes, Cucumbers, Peas, Potatoes, Plants, Cut Blooms, Fencing, Stone wages, good references.—WOODS, 1, Forework Road, Mitcham, Surrey.

FLORIST—Re-engagement, lady requires: 14 years' experience Floral Designs, Bouquets, Plants, Soules, used to taking charges, etc.—FLORAL, 10, 85, Lawrence Road, South Ealing, London.

Evaporate your Fruit by using the "NATIONAL" EVAPORATOR.

It pays for itself in one season, and lasts a lifetime. Made in all sizes to suit all customers. You can thus Save and Store all your Fruit safely. Preserve it without sugar. Utilise every ounce of it. Sell when prices are highest, and Reduce transport charges. Appliances can be made by children.

Patentless, free from— THE BRITISH FRUIT EVAPORATOR CO., Ridsdale Road, ANERLEY, S.E.

ELLIOTT'S Latest Improved SUMMER SHADING, "PINGO," for greenhouses. Best ever used, SASSA WILSON, Bridge Castle Road, Hinxton, Cambs. 1-16 (over 2 1/2) ft. R.H.S. 4d. Of Seedsmen, A. & N. Stores, or Elliott, Alfred Rd., Lond. W. 3.

The Gardeners' Chronicle SCALE OF CHARGES FOR ADVERTISEMENTS.

Advertisements intended for insertion in the next issue MUST reach the PUBLISHER not later than WEDNESDAY, 5 p.m.

Table with 4 columns: Ordinary Positions, Facing matter and Back Page, Half and quarter pages, column and half column spaces, 1/4 column, 1/2 column, 3/4 column, 1 column, 2 columns, 3 columns. Rates range from 10/10 to 1/10.

Front page (no display allowed) 1/6 per line space. (Headline counted as two lines.)

For discounts apply to address below. SITUATIONS WANTED.

26 words 1s. 6d., and 6d. for every additional 8 words or fewer.

These Advertisements must be prepaid, AND APPLY ONLY TO GARDENERS, &c., OUT OF EMPLOYMENT.

LETTERS FROM JAPAN. I. THE VEGETATION OF THE LIN-KU ISLANDS.

M R E. H. WILSON, M.A., F.R.S., M.C., East gathering material and formation for the Arnold Arboretum sent the following account of his visit to the Lin-ku Islands to Professor Sargent, who has kindly forwarded it to us for publication. These islands constitute one of the least known of the dependencies of the Japanese Empire, and are rarely visited by foreigners.

I have just returned from the Lin-ku Islands, where Pine and Palm trees, and have pleasure in reporting a successful trip. The southern half of the main island is very rocky, hilly, but of no great elevation, and most of the land is under cultivation. Sugar is the chief crop, and two crops of rice are raised in a year, the first being planted about the end of February. The northern part of the island is mountainous and sparsely populated, and is partly of coral rock and partly volcanic. Some of the small islands visited were purely volcanic. Near the sea the flora is composed mainly of sub-tropical and tropical plants, which have a wide distribution in the tropics. Of these *Pandanus odoratus* is the most abundant. The common trees are *Ficus nataka*, *F. Wightiana*, *Erythrina indica*, *Besleria javanica*, *Meiopsis cambrica*, *Terminalia Catappa*, and *Hibiscus tinctoria*. Inland on the hills and mountains a few Japanese plants, such as *Thea japonica*, *Koyia japonica*, *Distylium racemosum*, *Machilus Thunbergii*, *Viburnum odoratissimum*, and *Cestropus cuspidata*, occur, but the flora proper is largely endemic, and the woody plants are nearly all evergreen, whilst the majority have lustrous leaves. The striking features of the flora are *Pinus Induchensis* and *Cycas revoluta*, and these give much character to the landscape. *Pinus Induchensis* is the only species of *Pinus* in Lin-ku, and is not only wild, but has been planted very largely. It is one of the handsomest of Asiatic Pines, and is a very distinct and easily recognised species. The bark is

always grey, quite smooth on young trees, but early becoming scaly, and finally deeply fissured and cracked into plates of irregular size and shape. The winter buds are reddish brown, and the cones comparatively small, and not very persistent. Though abundantly distinct, it appears to me more closely related to *Pinus Thunbergii* than to any other Asiatic Hard Pine familiar to me. At its best the Lin-ku Pine is a handsome tree 100 feet tall, with a straight trunk from 9 to 10 feet in girth, and a broad, oval or flattened crown. The wood is of fair quality, rich in resin, and may possibly contain turpentine in commercial quantity. The trunk hollowed out and shaped forms the canoe in common use among the fisher folk. This Pine forms pine-woods with usually a dense undergrowth of evergreen shrubs and low trees, among which *Tree Ferns* and various kinds of *Palms* are conspicuous. I took many photographs of *Pinus Induchensis*, and collected abundant herbarium material, and also some seeds of it.

On the sea of the *Cycas revoluta* is wild, but it is everywhere planted in vast quantities, and is, perhaps, the most common plant in Lin-ku. Formerly, and to a less extent to-day, the pithy trunk furnished an article of food.

In order to collect and study the *Juniper*, which has long been known to grow in Lin-ku, I made starts to visit the islands 20 and 52 miles distant from Naha, my home. This *Juniper* is a lateral, prostrate, woody, and forms dense or low mats on the ground, as above the mark. The foliage is very green, and the fruit sub-globose. *Pinus Induchensis* is a very promising. The cones are a reddish-brown, and each has two conical bands. In fact, I have seen the *Borneo Island Japanese taxodium* in Lin-ku, which I am not prepared to give a name to. In Lin-ku I collected plenty of material, including ripe fruits, and also brought home living plants. Fortunately, they are all safe, and are being held in the Arnold Arboretum, but it could be useful in Southern California and Florida.

In Lin-ku I took five dozen photographs and collected about 50 numbered specimens, representing more than one hundred species. Of the more interesting plants collected I may mention *Quercus Maximii*, *Banksia*, *Lankensis*, *Conium maculatum*, *Mezereum*, *Conium*, *Rhododendron*, *Yucca*, *Ruellia*, *Conium*, *Yucca*, *Pinus*, *Mezereum*, and a local variety of *Conium*, and several other plants, and many more. The *Rhododendron sub-umbellatum* is a very representative in Lin-ku of the group, and is called *R. Induchense* in books, and is endemic.

The *Japanese* people are a distinct race, probably of Malay origin, as the main part of them, particularly the women and children are of Malay type, and very different from those of China and Formosa. As a race they are smaller than the Japanese, and their manners are mild and unobtrusive. The women in particular, look very hard and very old, but on their heads, which are abundant, and seem happy. The houses are very small, of bamboo, with the sides and thatched roofs, and each is enclosed by a wall or fence. The people seem very poor, and whatever wealth they possess appears to be squandered on the construction of enormous family tombs. By education of the children and the development of various industries, the Japanese are doing much toward the improvement of the condition and social life of the Lin-ku people.

On the trip I received very good assistance from the Japanese. The forestry officers at Katsushima and the Agricultural Department in Lin-ku exerted themselves to the utmost in our favour. I find that our work in Japan during 1914 has become widely known, and is viewed most favourably by the forestry officials generally.

NOTES ON IRISES.

REGELIA IRISES.

May I give a warning to those who grow these beautiful Irises. It is that the rhizomes should not be lifted until the root fibres are fully developed. In early June it will probably be found that the foliage is beginning to show signs of turning yellow, and that the tips of the new growths at the ends of the running stolons are showing through the ground. Until last year I always took this to mean that growth was mature and hastened to lift my plants before the main root fibres sent out their lateral shoots. I was, however, always disappointed to find that the roots died away before planting time came in October, and that flowers were few in the following summer. Last year I left my plants in the ground until the middle of July, by which time growth was much more mature. The result was that the rhizomes and roots were in far better condition in October, and this season the plants flowered better than ever.

SOME JAPANESE IRISES.

The Japane section of Irises is by no means a homogeneous group. There are at least two main groups, those with flowers of which the half of the ball bears large wings which arch over and clasp the style branch, and those of which the half of the ball is strap-shaped and wingless. The seeds of the species of the two groups are very different, but our knowledge of some of the rarer species is still so scanty that it is impossible to say with certainty into how many subdivisions these two main groups naturally fall.

It would be interesting if some geologist could tell us whether in the hills of Asia Minor the soil is a stiff clay, or at any rate that heavy red loam which is found in the limestone districts of Southern Europe, and which seems to be extraordinarily fertile, and also whether there are not large tracts of sandy soil in Turkestan. These theories are deduced from the behaviour of various plants in this sandy soil in Surrey, and it would be interesting to know whether they are in accordance with facts. In any case, the fact remains that the Persian group of Irises does not here, such *Tulips* as *pulehella* and *polychroma* are none too happy, and *Fritillaria aurea* refuses to live, while *Iris bucharica* grows like a weed, *Tulips* such as *Kantaminum* are difficult to eradicate, and *Fritillaria pallidiflora* grows 2 feet high, with six or seven flowers on each stem. Of these plants, the former are all natives of Asia Minor, while the latter come from Turkestan.

Experience has therefore led me to abandon the Western *Junos*, and to concentrate on the Turkestan species, which have well repaid my interest in them. Last summer I lifted all my bulbs of *Iris Rosenbachiana*, and my belief was confirmed that there are either two species or two very different local forms concealed under this name. Dr. Fedtschenko in the *Journal Russ. de L'Asiologie*, 1909, p. 77, but as he only separates it from *I. Rosenbachiana* by saying that the flowers are yellow, it is difficult to be certain with what plant he was dealing. I would suggest, however, that the true *Rosenbachiana* is the early-flowering form with bright orange pollen. The thick fleshy roots on the dormant bulb taper gradually and are of a pale yellowish brown. Here I have only one colour variety of this form and the flowers have falls marked with a bright crimson stripe on a white ground. The later form, which is probably *Fedtschenko's* *hal-shumana*, is very variable in the colour of its flowers, and has green or one or two seedlings of a pale creamy yellow marked with brown purple. This form has white pollen, and the roots taper much more abruptly than do

those of the true *Rosenbachiana*, and are of a whiter colour. I found when dealing with large numbers of bulbs that I could separate them into the two species by the colour and formation of the roots.

Perhaps the most striking and certainly the most vigorous of all the Juno Irises is *I. bucharica*, with white and yellow flowers. Here it has combined with the yellow *I. orchioides* and given me wholly yellow forms, with the vigour and size of *bucharica*. One chance seedling of *bucharica* has come wholly white except for a pale yellow crest, and in others the deep yellow of the type is replaced by a pale, delicate lemon yellow, which gives a beautiful effect. I buch-

type, and pale yellow forms which also retain this feature.

Iris orchioides is rich in colour, but the flowers are small and insignificant in comparison with those of *I. bucharica*. Seedlings vary a good deal, some having conspicuous bright green markings on the golden ground; some are of a pale sulphur-yellow, while others are wholly white or white with a yellow crest.

My failure to keep *Tubergemana* and *Willmottiana*, both of which come from the neighbourhood of Tashkent, in Turkestan, and have winged falls, makes me wonder whether there is not in that district a region of the heavy soil in which this kind of Juno Iris appears to

lings are easily raised in pots sunk to the rim in the open. The seeds must be sown soon after they ripen, or germination will be unsatisfactory. At the end of the first summer the small bulbs may either be left a second year in the same pots, if the latter are large and the soil rich, or sifted out and planted in September in beds in which they will flower two or three years later. *W. R. Dykes, Charterhouse, Godalming*

NOTICES OF BOOKS.

HERBS USED IN MEDICINE.

ONE of the many difficulties that the pioneers of the herb growing industry met with was to teach collectors of wild herbs to distinguish between plants having similar names, and between those actually used medicinally and similar species which have no medicinal or commercial value. Some of the latter, such as Agrimony and Hemp Agrimony; Centaury and Centaurea; Chamomile and German Chamomile; Woody Nightshade, Garden Nightshade, and Deadly Nightshade; Mallow and Marshmallow; Wood Betony and Water Betony; Valerian and Red Valerian; Hemlock and Water Hemlock; are often confused by those who have had no botanical training or experience. Mrs. Ellis has on this account published sixteen excellent coloured illustrations of such of these plants as are actually used in orthodox, or herbal, medicine, with such botanical descriptions as should enable any one of ordinary intelligence to recognise the plants by the aid of the illustrations. A certain amount of elementary botany, such as is necessary to understand the botanical terms used, is intercalated with the descriptions. This little brochure should be very useful to beginners in herb collecting. It does not pretend to give cultural or commercial information, for which references are given to other publications of the National Herb Growing Association. Books containing coloured representations of indigenous medicinal plants are scarce, and this attempt to supply a felt want should meet with generous recognition.

GORDONIA ANOMALA.

THE Chinese shrub illustrated in fig. 94 is a native of tropical and sub-tropical Asia, and was introduced to this country in 1816. The name *Gordonia* was given to the genus in honour of Alexander Gordon, a nurseryman of this country, who died in 1780; but the plant has also been known as *Polyspora axillaris* Sweet, under which name it is figured in *Bot. Mag.*, tab. 4019; and *Camellia axillaris* Ker, the name given under the illustration in *Bot. Rep.* IV., tab. 549, and *Bot. Mag.*, tab. 2047, 1819. In the very brief description given in the last-named work, it is stated that the plant had then been cultivated for several years in a Fulham nursery, and was supposed to have been introduced from China by a Mr. Roberts. It flowered in December, 1818. The plant from which our illustration was taken flowered at Kew in April and May, and Peter Urban Fourné reported a specimen at Kew which flowered in May and June, 1905. Nicholson, in his *Dictionary of Gardening*, gives November as the month of flowering. Prof. Sargent, in *Planta Wilsoniana*, gives the period of flowering as the latter part of the summer and the autumn. Sargent adopts the specific name of *axillaris* given by Szayszlowicz; he describes the tree as being 6 to 8 metres tall, evergreen, and bearing white flowers. The specimen illustrated is two-thirds natural size.

By Mrs. J. D. Ellis. (National Herb Growing Association, London, 1917.) Small 8vo., 32 pp., with sixteen coloured plates. 3s., post free.

FIG. 94. GORDONIA ANOMALA. FLOWERS WHITE.

(Photograph by C. P. Roffell)

aria also crosses readily with *I. warleyensis*, and many different seedlings have recently been in flower here. The style branches and the standards are usually tinged with blue, and the blue of *warleyensis* contends with the yellow of *bucharica* to produce much variety in the markings of the falls. Sometimes these are yellow with a greenish tinge at the edge; sometimes the blue-purple only appears as blotches on the yellow, and sometimes there is little trace of the influence of *warleyensis* on the falls at all.

This *warleyensis* grows well here, but never with the vigour of *bucharica*. It has also given me a variety of seedlings, including a white form which retains the orange-coloured crest of the

level. Yet, the various crosses between *smidgenensis* and forms of *peisota*, which Van Tubergen has raised at Haarlem, presumably in the sandy soil of the bulb garden, dwindle away here.

The lifting of a number of bulbs of Juno Irises is most trying to the temper, even in the lightest of sand. In heavy soil, baked hard in summer, it must be so disheartening that no gardener except the most callous could persevere with it. The slightest jerk or twist snaps the fleshy, brittle roots or detaches them bodily from the base of the bulb. It is true that clusters of roots thus detached do develop buds in the course of time, but I have yet to find that these ever develop into vigorous bulbs.

I. bucharica seeds here abundantly, and seed-

CONFESSIONS OF A NOVICE.—XV.

Nor the least curious of the after-effects of the severe winter is the breakdown of the garden calendar. The floral times are out of joint, and flowers which hitherto had never met have lately nodded acquaintance to one another. In this garden, at all events, *Forsythia suspensa*, which ought to be a herald of spring, marched in the procession with the *Aubrietias*. The Darwin and the early Tulips went hand-in-hand, and the Daffodils, which ought to take the winds of March in beauty and to come before the swallows dare, were this year, like so many other plants, a month behind their scheduled time. Yet in this temporal anarchy many floral things, though belated, observed the relative times of their coming. The Apples waited decorously till the Peas were past their prime before fully opening their blossom. The response of plants to the hard winter weather appears to be capricious. Some, like the Larch and Laburnum, seem to reply by a sort of canny timidity. The birds poked their way into the open world a month later than usual.

For weeks the Larch buds, tipped with yellow, negotiated the weather as cautiously as a ship in a fog, and it was only when a fine burst of sunshine came that they threw caution to the winds and burst forth suddenly in their exquisite greenness, and not until June did the Laburnum throw off the silver-shining armour of its buds and reveal its yellow racemes.

Later, after brilliant sun, warm showers forced everything alive in the garden into flower. Here and there Stocks and Wallflowers which survived the killing frost scurried into flower, and my garden favourite, *Cheranthus Allionii*, flowered beside them and proved at once its superior beauty and hardiness. My Fig tree, under which in my old age I had promised myself an unbragging seat, assumed black in mourning for its own death, but near by in scarcely less sheltered positions *Magnolia* has bloomed as they had never bloomed before. *M. conspicua*, purest of flowers, has been exquisite, with its great white blooms appearing to float in the air. *M. Lemoii*, a little later, was like a candelabrum, with lamps of old rose and *M. alexandrina*, which looks like a hybrid between *M. conspicua* and *M. Lemoii*, bore its large flowers, pure white within and flushed with pink on their outsides. Nor has any night frost come to mar the beauty of these most exquisite blossoms. *Cupressus macrocarpa* later, said to be harder than the type, has just—and only just—escaped the frost, and is now resuming that mighty rate of growth which, at least on this light soil, makes it the most acceptable of all Conifers to those who are in a hurry to convert a novice garden into an established place.

The Potatoes on the lawn are growing apace, and the green borders, which are all that remain, are proving that the sacrifice of the lawn to Potatoes must be ascribed solely to patriotism, and not to despair of even making a real lawn. The top-dressings of sulphate of ammonia, of superphosphate, of chalk, and of matured road sweepings have at last proved their effect, and the border relies of the lawn that was would make superb turf if we had the labour to mow them. But that is not to be. Like all proper gardeners, all our energies are set on raising food, and the only relaxation which I am allowed from pushing the Planet Junior hoe is the destruction of the infinite variety of caterpillars and grubs which are battering on the fruit trees.

In the vegetable garden signs are not wanting that seed generally so fertile is less good than in normal years. There are gaps among the Peas and Parsnips, and even in the rows of Turnips, and it will require this year, and still more next year, a nice judgment to hit off the proper sowings to avoid waste on the one hand and broken rows on the other. Yet I am told

that it is of the first importance for every gardener to be as economical as possible in the use of seeds. The demand was never so great and the supply was never so difficult to maintain. Economy in seed-sowing is therefore an imperative duty. I have obtained supplies of the Brown Haricot Beans which the R.H.S. has procured from Holland. I sacrificed a couple of dozen in order to satisfy myself that they are really good to eat. The result of the test was very satisfactory, and these Beans appear to me to be of the best flavour of any Haricots I have tasted. I have asked for another pint. *A. N.*

THE MARKET FRUIT GARDEN.

BIRDS AS ALLIES.

It is difficult to estimate the extent to which birds aid the fruit grower in his campaign against caterpillars and various injurious insects. On two or three occasions in past seasons, when I was preparing to spray against caterpillars, I found they had almost disappeared from the trees they had infested. This season, again, although at the time of writing spraying is being continued, there are cases in which the caterpillars on Apples and Plums that had been seriously attacked have been greatly reduced in number, if not quite cleared off the trees, so far as can be told by smartly jarring the branches, or shaking them violently. When this was done a week ago numerous caterpillars fell to the ground, whereas, in the cases referred to, few, and sometimes none, were thus brought down. But we cannot afford to wait while birds are clearing off caterpillars, which is slow work when the pests are as numerous as they are this season. Enormous damage has been done in the meantime. There are always great flocks of chaffinches in my orchards. I prohibit the taking of their nests, and those of tits, in spite of the fact that the latter birds do damage by pecking holes in fruit. The blackbird, the sparrow, and the mistle thrush are the only birds whose nests and eggs I authorise one of my working lads to take, paying for the eggs brought to me. Common thrushes are regarded as doing more good than harm, although they eat Strawberries, Raspberries, Currants, and some other fruits. It is when birds have young ones to feed, as at present, that some varieties are very useful in clearing trees of caterpillars.

SHORT LIFE OF THE APPLE SPIDER.

The first Apple spiders this season were found on April 29. They were then very small, and apparently just hatched, and not many were to be found before the end of the month. By May 31 very few appeared to remain in the trusses of blossom on the earliest blooming varieties. The great majority had obviously developed into the perfect insect stage, as little swarms of psyllas were startled into flight on the jarring of a branch. In that stage they are harmless, and therefore the injurious campaign of this insect is a somewhat short one. My investigations dispose me to conclude that the injury done by this insect is much exaggerated. *Southern Grower.*

ON INCREASED FOOD PRODUCTION.

FOOD PRODUCTION AT GATTON.

At Gatton Park, Reigate, the residence of Sir Jeremiah Colman, Bart., many acres of grassland have been ploughed up and planted with Potatoes and other food crops. A number of flower beds in the pleasure gardens have been planted with Beet, Carrots, Onions, and other vegetables, instead of the usual bedding plants. Mr. Collier, the head gardener, is raising plants of various kinds of vegetables for distribution to the cottagers in the neighbourhood, whom he is also assisting by his advice on cultivation.

STRAWBERRY PLANTS.

In order to secure good crops of Strawberries in the shortest space of time, plants should be raised from vigorous plants of the previous season. The strongest runners should be selected and layered as soon as fit, in 60-sized pots filled with suitable compost. These, if carefully attended to with respect to watering, and the removal of superfluous growths, will quickly fill their pots with roots. Sever them from their parents, and place them in a semi-shaded position. Afterwards plant in an open site upon well-prepared soil, and give liberal supplies of water and liquid manure. If kept free of runners they will make strong plants before winter. Plant in rows 2 feet apart, and 1 foot apart in the rows, each alternate plant being removed after the first crop is gathered, if the plantation is to be used the second year. *This Chamber, The Home Gardens, Monmouth.*

DRIVING FRUIT.

In a recent issue of the *Evening News*, Mr. Marcus Knox, the novelist, gives an account of the methods of drying fruit for winter use as practised on the Continent, particularly in Switzerland, which seem deserving of adoption. The method is suitable for the harder fruits, such as Apples, Peas, Plums, Cherries, and Whortleberries, but is not practicable with Strawberries, Raspberries, or Blackberries, which must be bottled. Sound, ripe fruit only should be used, and must be first carefully wiped, but not washed.

Small Apples may be merely cut into halves for drying, but the larger fruits are best peeled, cored, and quartered, or, if preferred, may be cut into rings. Peas should be peeled and quartered, but only mid season and late varieties should be used, as the earlier sorts do not keep well. The stones of Plums and Cherries may be removed, but, except in the case of the largest Plums, these fruits are said to be better if the stones are allowed to remain.

The drying of the fruit requires care, and it should be realised that the fruit is to be dried, and not cooked. On the Continent, where the sun heat is greater and the air drier than here, much fruit drying is done out of doors, and it is considered that the fruit partially dried in the sun has an improved flavour. In the villages where the old fashioned brick ovens still exist, the fruit, after the preparatory sun-drying, is finished in the ovens; the heat that remains after the bread has been baked is usually just right for finishing the fruit. An excessive temperature in whatever type of oven is used must be guarded against, and novices are advised to experiment with small quantities before treating the bulk. Those who have greenhouses should make use of them for commencing the drying. The fruit must be laid out singly, and to keep the Apple rings flat they should be weighted.

When finished and quite cold, the dried fruit may be stored for winter use in tins or boxes, an tight receptacles are by no means essential; in fact, in Switzerland much of the dried fruit is hung up on the kitchen rafters in linen bags. But care must be taken to select a perfectly dry place, as damp is fatal to the keeping properties of the fruit, which should be periodically examined, and any which show signs of dampening should be taken out and used. *A. C. B.*

A PROFITABLE WAY OF TRAINING THE TOMATO.

In these gardens, for many years past, Tomatoes grown under glass have been trained in the following economical manner: The plants—single cordons are planted at 15 inches apart in a ridge of soil placed beneath the front of the trellis, and, as their growths extend, they are secured to the trellis. All lateral growths, with the exception of one at the base of each plant, are removed as they appear, while those retained are stopped at one leaf. Subsequent

growths are confined to one to each spur, and these are kept stopped at one leaf until the principal rod reaches its allotted space. By this time the earliest fruits commence to ripen, and as the gathering of each cluster is completed the leaves placed near to it are removed, by which means a section of the rod is bared. A shoot is at this time allowed to extend from each spur and trained up the old rod, this course being followed until the young rod entirely takes the place of the old one. The secondary rods, provided the plants are assisted by suitable stimulants, are equally prolific with the first, and by this system of training a succession of ripe fruit can be continually maintained from a single set of plants, with an appreciable saving of time, space, and expense, compared with that of planting another crop for succession. In our case the earliest fruit upon the young rods ripen before those at the top of the old ones are all gathered. The continuation and the length of time that a supply of fruit lasts by the adoption of this method depends, of course, upon the length of the rods of the plants. By the selection of suitable varieties, such, for instance, as *Sansiree*, combined with careful management, the plants may be kept short-jointed, and their cropping powers thereby increased. *T. C.*

PARSLEY.

PARSLEY should be grown in moderately heavy soil, and in a situation not too warm and gravelly, nor much exposed to the sun. Before digging the ground, spread a layer of soot, lime, and wood ashes in equal quantities over the surface, and work the materials well into the soil. This will make it vermin-proof for twelve months, and the Parsley will grow unmolested as far as grubs are concerned. Parsley should be sown on ground that has been well manured for the previous crop, and fresh manure is not needed. If sown in June the plants will remain perfectly good for twelve months or longer, but those sown in March generally run to seed early the following spring.

Sow the seeds in drills made 15 inches apart and about 1½ inch deep. The material used for covering the seed should be half soil and half lime, with soot and wood ash added.

When the plants are 5 inches high they may be thinned to about the same distance apart, but if they are extra vigorous they may be allowed a space of 6 inches apart. As soon as the plants meet in the rows, the large leaves should be gathered, as they become too coarse for use. After furnishing a supply all the winter, the whole of the leaves may be cut off close to the ground, and, when the plants grow again, the foliage will be as fine as ever, especially if a little soot is washed down about the roots at the time of cutting off the old leaves. *James A. Paice.*

NITRATES FOR BRASSICAS AND ONIONS.

The prevailing hot and dry weather makes growth very slow in autumn Cauliflowers and autumn Cabbages, and Brussels Sprouts. A dressing of 1 ounce per square yard of nitrate of soda will ensure a quick, healthy growth again, and assist in making up lost time when the weather changes. It should be scattered between the plants when the leaves are dry, just before hoeing, and will soon work down to the roots of the plants; if put on the leaves when they are wet it burns them. It should not be given to Broccoli, as they would grow soft and prove less able to stand severe weather. For very light soils sulphate of ammonia should be used instead of nitrate of soda, as it is not so quickly washed down by heavy rains. Onions that show signs of suffering from drought or attacks of mildew should have 3 ounces of superphosphate or dissolved bones per square yard, in addition to the nitrate of soda, but unless there is danger of losing them it is better not to apply those manures before the plants commence to form their bulbs, otherwise there may be a tendency to develop long necks. *W. H. Druce.*

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

CYPRIPEDIUM.—After *Cypripedium Stonei*, *C. Roth-schildhamm*, *C. callosum*, *C. Lawrenceum*, and the hybrid *Maudiae* have passed out of flower, and new growth commences, any necessary repotting may be done. Plants that are in a root-bound condition may be shifted into larger pots. Remove with a pointed stick as much of the old compost as possible without damaging the roots; fill the fresh pot to one-half its depth with clean crocks for drainage, and pot firmly, keeping the base of the plant just below the rim of the pot. The summer-flowering *Cypripediums* do not require a compost of such a retentive nature as those that produce their flowers during the winter. A suitable rooting medium for the former is composed of three-parts *Osmunda* fibre and one-part good fibrous loam and *Sphagnum*-moss, the whole cut rather short, adding crushed crocks in sufficient quantity to keep the soil porous. The materials should be well mixed. After potting, place the plants in a shady part of the house, and keep the compost just moist until the new roots have grown well into the soil. During bright weather the plants will be benefited by a fine spraying overhead on mornings and afternoons, and the surroundings should be kept moist. Care should be taken with regard to *C. Stonei*, *C. Roth-schildhamm*, and others of that section, not to allow water to lodge in the centre of the growths or in the axils of the leaves, or they will decay. *Cypripediums* of the dwarf-growing species, such as *C. bellatulum*, and its variety *C. album*, *C. niveum*, *C. concolor*, and such hybrids as *C. Helen H. C.*, *Lawrencei*, *C. Chapmanii*, *C. Venus*, *C. Virgatum*, and *C. Mrs. E. V. Low*, after passing out of flower, should also be given attention at the roots. These plants are best grown in fairly deep pans, provided with ample drainage material. A suitable compost consists of two-parts good fibrous loam broken up in lumps about the size of Walnuts, and one-part peat mixed freely with small pieces of mortar rubble. After repotting, they should be placed near the roof glass of the Cattleya, or intermediate house. The plants are very liable to attacks of the small yellow thrip, which should be destroyed by means of frequent fumigations. Take the usual precautions in watering newly-potted plants until the new roots are well established in the fresh compost.

THE KITCHEN GARDEN.

By J. DENN, Foreman Royal Gardens, Windsor.

PEAS.—There should be no delay in applying a good mulching of farmyard manure to all main-crop and late Peas. If this work can be accomplished before the soil becomes too dry, it will do much to retain what moisture there is in the land, and lessen the danger of having the crop injured by mildew. One liberal application of soft water after the mulching will do more good than frequent light waterings.

SCARLET RUNNERS.—Strong sticks should be placed in position before the plants become entangled with each other, a mulching applied over the pots, and a good soaking of clear water given. The manure should be placed as near the stems of the plants as possible, and thoroughly shaken up as the work is being done, so that rain-water may find its way to the roots instead of being cast off by hard lumps of manure.

ASPARAGUS.—Do not cut Asparagus after this date, but clean the beds, and give them a good dressing of salt or some approved artificial manure. In exposed positions the shoots should receive some support, as much injury may soon be done by rough winds. Soaking with manure-water, given several times during the season, will be very valuable.

VEGETABLE MARROW PLANTS.—These should receive a liberal supply of water at the roots,

and if dry weather continues the plants will benefit by being damped overhead in the evenings. Keep worthless shoots and decaying foliage removed.

PARSLEY.—A good sowing of Parsley should now be made for winter and spring supplies. Sow in drills 18 inches apart, and select a position which is protected from north and east winds, as these sometimes work serious injury to this crop early in spring.

CAULIFLOWERS.—The plants which were put out in April will now be turning in, and may need liberal watering at the roots. Great Dane and Magnum Bonum are showing well, and Early London will follow a fortnight later. Successful plants should also receive a liberal supply of water, and the soil needs to be frequently stirred between the plants. Further plantations should be made in order to maintain an unbroken supply throughout the season. Lift the plants very carefully, retain as much soil on the roots as possible, and thoroughly water them directly they are planted.

LETTUCES AND ENDIVE.—A shady border should be selected for Lettices for the remainder of the season. Sow the seeds thickly, and as soon as the seedlings are large enough to handle transplant them removed at the thinning of the crop. If thin sowings are made very little transplanting will be necessary, as Lettices generally succeed better during hot summer weather if allowed to mature where they are sown. Prince of Wales Cos and Monument Cabbage Lettuce are good varieties for summer sowings. Endive should also be sown in a shady place and treated in the same way as Lettuce.

RADISHES.—Sow Radishes frequently on rich soil, protected from strong sunshine. Give a liberal supply of water to promote quick growth.

CHICORY.—It is not too late to sow Chicory for spring supplies. Sow in shallow drills 18 inches apart, and thin the seedlings freely. Early-sown Chicory should be freely supplied with water at the roots, or many of the plants may run to seed during hot weather. Keep the hoe freely at work between the rows, and dust the plants with soot during showery weather.

THE FLOWER GARDEN.

By W. J. GEISE, Gardener to Mrs. DEMFSTER, Keele Hall, Staffordshire.

LAWNS.—To keep tennis courts, croquet lawns and bowling greens in good condition they should be mown at least twice weekly, and as frequently rolled; or, if the lawns are not required for games now that so many things of greater importance claim our attention, once a week will be sufficient. During dry weather lawns must be watered. A light dusting of some approved lawn manure, applied before watering, will be beneficial. Grass edgings should be cut at frequent intervals.

MULCHING AND FEEDING.—On light soils, mulching can hardly be carried to excess, for there is not labour available now for frequent waterings in the flower garden. Most plants in herbaceous or mixed borders will show renewed vigour during dry weather if mulched with decayed manure and leaf mould, and watering can then be reduced to the minimum. Rose trees, climbers, shrubs, waterside plants and rock plants will greatly benefit by mulchings of some description, but manure must not be used for the Alpines; leaf mould and coconut fibre being more suitable. One gallon of liquid manure to six gallons of water is sufficient for most purposes. Four ounces of guano or other approved fertiliser dissolved in six gallons of water will make a capital stimulant as an occasional change from liquid manure.

WATERING.—During hot, dry weather it is impossible to refrain entirely from watering. Rock plants soon show signs of distress if neglected in this respect, and many herbaceous plants require copious supplies of water at this period. Give the plants a thorough soaking so that the water will reach all the roots, then apply a mulching of decayed manure, leaf mould, or even lawn mowings, to retain the moisture. By these

means much labour will be saved. Late-planted shrubs, Rose trees, ornamental trees, and climbers should receive similar treatment. All summer bedding plants recently planted may be given a mulching of cocoanut fibre or sifted leaf-mould. Plants in reserve beds will need watering occasionally. Syringing or sprinkling of seed-beds during dry weather does much good, and assists germination. Plants in tubs or vases must be examined every morning. Syringings in the evenings after a hot day will assist growth.

HOING.—The use of the flat, or Dutch, hoe cannot be too strongly recommended during dry weather. Rains and waterings soon cake or harden the surface of the soil, and, as this is detrimental to growth, the surface should be stirred frequently. Even if weeds are not visible, the soil should be stirred.

FRUITS UNDER GLASS.

By JAS. HEDSON, Head Gardener at Gunnersbury House, Acton, W.

VINES IN BEARING.—A few weeks ago I advised readers not to tie up the shoulders of the larger bunches of Grapes. Instead, it is better to go over the bunches and gently lift the shoulders with a stick. This should be done on two or three occasions, so that the berries do not become interlocked with each other. By lifting the upper berries and freeing them, the bunch will increase in the height of its shoulders and tighten to the stem. Every effort should be made to do the usual stopping of the lateral growths on vines in bearing. Much of the young shoots with the thumb and forefinger. See that rather more light is given to white Grapes during the process of colouring than to black varieties; this can be managed by moving the developed foliage aside for the time being. If there is any trace of Madreshead Court swelling to the finishing stage, see that ventilation is carefully attended to. Want of ventilation causes splitting in this Grape, which may also occur during a period of damp, dull weather, when the atmosphere is heavily charged with moisture. To prevent this maintain rather more warmth in the pipes. Excess of water during the final stage of swelling will also cause splitting. Keep a look out for any berry that may crack, and remove it as carefully as possible. When any Grapes are ripe enough for cutting, keep the temperature of the house somewhat lower and ventilate freely, except in very damp weather. If birds or troublesome insects stretch some fly-netting over the ventilators.

STRAWBERRY RUNNERS FOR FORCING.—No time should now be lost in securing the requisite number of runners. The best way by far is to set apart sufficient young plants of last year for this purpose, pinching out all the flower spikes. By so doing, quite a fortnight will be saved, and this is all important. Do not take the secondary runner off any growth if there is sufficient to shoot. For the first year's batch of plants, I am in favour of 42 inch pots, either earse or what is known as size 38. By using these pots, some labour may be saved in the potting if we lay straight away into the fruiting pot, collecting the best runners for the purpose. Of course, this only applies to the first early variety chosen for the purpose, such as Keen's Seedling, when a good stock of this old Strawberry can be obtained. My next choice is King George (Laxton's). I have found this Strawberry to be quite reliable. For packing to send away, it is the better traveller of the two. I am a strong believer in firm potting; the growth will not be quite so luxuriant, but it will be sturdy. When the larger pots are used, that is, 52 inch, prepare a sufficient number of "thumbs," rather than "stixies," for the purpose of having, pressing the soil down quite firmly. One crack is sufficient for drainage. Plunge these pots closely together, for it will be easier to water them, and they will not dry up so quickly. Use the best available soil for Strawberry culture in pots, inner some what for rooting the runners than in the after potting. To a good fibrous loam add some finely-sifted mortar rubble in sufficient quantity

for it to be distinctly traced, and a few handfuls of soot. When the loam is not all that one could wish, use with it some sifted leaf-soil, or some of the spent manure from a Mushroom-bed. Do not lose any opportunity of preparing the permanent fruiting pots; clean pots and clean drainage are both essential. Do not force so many plants as in former years, is my advice. Labour is scarce, and may be so another season.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcote, Eastwell Park, Kent.

CAMPANULA PYRAMICALIS.—This species, and its white companion *C. p. alba*, are satisfactory plants for decorative purposes. They last a long time in good condition if placed in a dry and shaded position as soon as the flowers begin to open. Last year's seedlings are throwing up their flower spikes, and should be fed regularly in order that they may develop to the fullest extent. Liquid manure should be used, alternately with a little artificial manure given as a top-dressing. Plenty of water will be required at this stage. Stake them in good time, if exposed to wind, but remove them under glass before the flower spikes open. The compact varieties are excellent for pot culture. Seedlings sown this spring for next year's blooming, and picked out early in boxes, can now be potted on, or planted out in the reserve garden. If the latter, they can be lifted and potted in the autumn. If left out during the winter, they can still be carefully lifted and potted as the flower spikes are developing. This later plan is not recommended, except in cases of emergency, as, if the balls are much broken the plants will not be satisfactory.

CANTERBURY B'ILLS (CAMPANULA MEDIUM).—These are great favourites for decorative purposes, and a hitch in pots is exceedingly useful before the outside border plants are in bloom. Give plenty of water and stimulants. The plants can be preserved in many shades, including good pinks and whites in both single and double varieties.

GREENHOUSE CLIMBERS.—Climbers in houses should be looked over at frequent intervals at the present season, as growth is very rapid. Trim the shoots, leaving only sufficient to train to the allotted space, and stopping the others fairly close to the main stem. If the house is sufficiently lofty, a number of the lateral growths can be allowed to drop from the vines in a natural manner. There is a wide range of climbers suitable for a cool greenhouse. One of the most satisfactory for an amateur is *Bougainvillea glabra*, which can be grown successfully under cool conditions. Exposure to the sun is not injurious; the flowers assume a most brilliant colour, and last in bloom almost the whole season. *Echinas* can be trained as pillar or roof plants. *Bignonia* and *Mandarin* are variety, *Jasmin*, *Lapageria rosea*, and *alba*, *Paeonia*, *Plumbago capensis*, *Mandevilla surcuferens*, *Solanum Wendlandii* and *S. praevenoides*, *Saxifraga* and *Streptocodon* (one can use all beautiful climbers which will thrive admirably in a cool house, and keep up a succession of bloom practically the whole season.

THE HARDY FRUIT GARDEN

By W. A. COOK, Gardener to the Hon. ARTHUR DAVRY, Abbot's Wood, Godalming, Surrey.

BUSH FRUITS.—Red Currants are very promising this year. In pruning the bushes, retain the old wood, with a few strong shoots at the end of the branches, to make the tree taller and bigger. Stop all shoots not required for this purpose, and pinch all side growths, retaining only those that are required for extension. Occasionally it is well to run up one or two from the base, to take the place of any that show signs of decreased vigour. White varieties require similar treatment. A good soaking from a sewage tank is advantageous at this stage. Black Currant should only be stopped when the growths are extra vigorous, but young shoots should be encouraged from the base, to take the place of old,

worn out growths. Gooseberries are yielding large crops, and require scarcely any pruning at this season, excepting where the growths are too close together, when the fruit on a superfluous one may be gathered and the shoot removed. Cordun bushes may be both stopped and thinned if too thick and vigorous.

PEAR TREES ON WALLS. All Pear trees should be examined frequently, thinning the fruit, pinching the shoots, and tying in the growths when long enough. Varieties such as Duoyette du Commerce, Beurré D'iel, Prémisier Duchess, Glou Monceau, and others require severely thinning, and they are best when of good size. Some of the second early Pears are also much improved by judicious thinning, including Marguerite Marillat, Williams's Bon Chrétien, Beurré d'Amabilis, Triomphe de Vienne, and Souvenir du Congrès. See that the roots are not allowed to lack moisture.

CHERRIES.—Cherry trees ripening their fruits need plenty of moisture. See to the proper tying of the growths, especially of cord-trained trees. The Cherries should remain on the trees till they are thoroughly ripened, for, although some kinds are quite ripe when gathered before they are quite ripe, the cherries do not, the stalks quickly wither, and the fruits become tough. Late varieties should have copious supplies of water, and should be frequently washed in order to combat anthrax. Those trained on north walls will not require so much watering as those on west or south-west walls. Bush and pyramid trained trees on light soils may also require moisture. Cherry trees should not be neglected after the fruits are gathered, but should receive careful watering and syringing till growth is matured, and all growths kept tied to prevent the wind damaging them.

STRAWBERRIES.—These are ripening very early. I gathered the first fruits outside on the 9th inst., but the main crop is now ready. The trusses of fruit of late kinds should be lifted from the soil to prevent washing by violent storms, and, if necessary, afford copious waterings, as the season will be a short one especially on light soils, and if the small, imperfect fruits are removed, it will make those that are left all the better.

THE APIARY.

By CLERK.

TAKING BEEH TO CLOVER.—After dusk give the bees a little puff of smoke, then close the entrance. Take off the roof and screw on at least two strips of wood across the frames to keep them steady in transit. Having previously levelled the ground, put down the hives at least 2 yards apart. After removing the screwed on strips put on the queen excluder and shallow frames (if a great quantity of honey be wished) fitted with drone base foundation and wired. It is best not to put on the supers the same night, because the bees will be irritable after the journey, and as it is dark, too, manipulation would be very difficult for any but the most skilled apiarists. Do not forget to open the entrances before leaving the hives. Wrap up the supers very warmly, for draughts and cool supers court failure. Whenever I go I find that this apparently simple matter is neglected, and bees refuse to use them, especially if sections are employed. Wrap the supers as completely as in winter, for what will keep out the cold in winter will keep out the heat in summer.

In fitting up sections and shallow frames, use full sheets of foundation, worker base for the former and drone for the latter, as it is easier to extract honey from the wider mouthed cells. An acquaintance in the North of England took his bees to the Clover a few years ago, and in a very few days his supers were nearly full, so he put on a second and a third, but the weather became bad before much was done to the third, and he had an average of 50 lbs. of delicious Clover honey from each, which brought a good price after winning several valuable prizes at different shows. £10 in all, and the honey was sold at prices ranging from 1s. 3d. to 1s. 8d. per pound.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or alterations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, JUNE 27—

Covent Garden Flower Show.

THURSDAY, JUNE 28—

Rev. Botanic Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years of Greenwich, 61.4.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, June 1, 10 a.m., Bar, 29.2, temp, 65° Weather, Cloudy.

SALES FOR THE ENSUING WEEK.

FRIDAY
Collections of Orchids, by Protheroe & Morris, at 57 and 59, Chancery, at one o'clock.

We are glad to know that Miss Saunders, who has already done so much to elucidate the mode of inheritance of "doubleness" in Stocks, is continuing her investigations and extending them to other flowers.

As is now generally understood, doubleness in Stocks is a remarkable and interesting phenomenon. The doubles are themselves sterile, and, therefore, when raised from seed have to be built up from "double-throwing singles."

It is probable that doubleness in Wallflowers is similar to that in Stocks, for the old-fashioned double Wallflower, not often seen nowadays, is, like the Stock, fully double, and also sterile. Whereas, however, it is open to anyone to raise double Stocks provided he possesses the right strains of singles, the fully-double Wallflower is not produced from seed. It arose as a "sport," and can only be propagated by cuttings.

A new strain of double Wallflowers, originated by German growers, exhibits different degrees of doubleness. This strain is fertile, and hence may be perpetuated by seed. In *Meconopsis cambrica* (Welsh Poppy), Carnation, and Hollyhock doubleness is a variable phenomenon, and

intermediate stages between single and full double are of frequent occurrence. In *Meconopsis* the full double is sterile, but one and the same individual may bear flowers of different degrees of doubleness. When a single and a high-grade double are mated the progeny bears flowers of an intermediate degree of doubleness, and gives rise in turn to singles, intermediate doubles, and pure-breeding doubles in the simple proportion of 1:2:1. The first reference to double *Meconopsis* which Miss Saunders has been able to find is in the *Gardeners' Chronicle*.^{*} The plant which is illustrated in fig. 95 appeared spontaneously in Messrs. Backhouse's nursery.

FIG. 95.—DOUBLE FLOWERED *MECONOPSIS CAMBRICA* THAT APPEARED SPONTANEOUSLY IN MESSRS. BACKHOUSE'S NURSERY.

It is interesting that the figure of this early sport represents a flower in extreme double condition all the parts of the flower within the normal corolla consisting of narrow, strap-shaped petaloid structures. But at the present time *Meconopsis* with all degrees of doubleness (petaloid) occur. In *Meconopsis* doubleness behaves as a dominant, whereas in Sweet William doubleness—in the sense of the transformation of the stamens into petals—behaves as a recessive.

The Hollyhock (*Althaea rosea* and *A. ficifolia*) produces doubles which are capable of yielding seed. High-grade

doubles, as well as singles, breed true, and when crossed with one another give rise to intermediate (low-grade) doubles, which behave as heterozygotes, producing, in the next generation, singles, intermediate doubles, and full doubles.

In the Carnation (*Dianthus Caryophyllus*) the case would appear to be different. Seed from doubles throw some singles. According to Mr. James Douglas, the number of singles amounts to 12 or 15 per cent. According to work carried out by Mr. J. B. Norton,^{*} doubles yield doubles, semi-doubles, and singles in the proportion of 1:2:1, and Norton regards the semi-double, in which some stamens are always found, as the florists' type. This conclusion was confirmed by Batehlor,[†] and has been verified by Miss Saunders. Singles are recessives and breed true, but of doubles obtained by crossing single and double and breeding from the F₁ plants, it is not possible to discriminate between pure doubles and heterozygous doubles. Nevertheless, as Miss Saunders has found, it is a fact that some doubles breed true (pure dominants) and some throw doubles and singles.

NATIONAL SWEET PEA SOCIETY.—The National Sweet Pea Society, having abandoned the exhibition that was to be held in Manchester, will hold a special exhibition of Sweet Peas in conjunction with the Royal Horticultural Society's meeting at the Drill Hall on Tuesday, July 3. No money prizes will be given, but medals will be awarded to the more meritorious exhibits.

SOUTHAMPTON SUMMER SHOW.—We learn that the Southampton Royal Horticultural Society's Summer Show will take place this year on July 11. There will be prizes for Roses, Carnations, and Sweet Peas, besides a number of classes for fruit and vegetables.

FRUIT CROPS IN THE NETHERLANDS.—In a report dated May 30 from the British Consul General at Rotterdam it is stated that the prospects for small fruit crops in Holland are satisfactory, although Raspberries suffered from the severe winter, and some damage was done to Gooseberries by insects. Prospects for Red and White Currants are on the whole very good, though near Winschoten and in part of North Brabant they are only fairly good. Prospects for Black Currants are from good to very good. Gooseberries generally are good to very good, and favourable reports are received as to Raspberries from the neighbourhood of Breda, the principal district of cultivation. Cherries generally show good prospects.

AGRICULTURAL EDUCATION FOR DISABLED FRENCH SERVICE MEN.—We learn from the *Revue Horticole* that at the Agricultural School at Oisellerie (Charente, France) a department has been opened for the re-education in agricultural operations of disabled Service men. The course will be open free to discharged, wounded men, and those still being treated at the hospitals. The scheme has been sanctioned by the Minister of Agriculture.

PINEAPPLE-GROWING IN SOUTH AFRICA.—The *Journal of the Royal Society of Arts* publishes in its issue for June 15 a fascinating account of the Pineapple industry in South Africa, which has reached amazing proportions in the comparatively short period of sixty years. It appears that until the middle of the last cen-

* See *Gard. Chron.*, XXXVII., 1905, p. 63.

† "Carnation Breeding," *Aust. Report American Breeders Assoc.*, vol. 1, 1912, p. 193.

tury Pineapples were unknown in South Africa, but at the present time, on one estate alone, there are 2½ million plants. The soil and climate of South Africa are eminently adapted for Pineapples. Sixpence to a shilling per dozen is the average selling price, out of which the grower obtains a good profit. It is calculated that the returns are about £60 per acre per annum. One large estate, the Langholm Estate, is obtaining concessions from shipping companies which will enable a number of Pines to be sent to the European markets on advantageous terms.

THE LATE GEORGE SCHNEIDER.—We notice in our esteemed contemporary, *L'Horticulture Française*, an appreciative article based on the notice of MR. SCHNEIDER which appeared in these columns at the time of his death. Our readers will sympathise with the widow in her recent loss—the husband of her youngest daughter (Maad) having been killed at the Front a few weeks ago. He was serving in the H.A.C.

HORTICULTURAL WAR RELIEF FUND.—At the invitation of Lady Northcote, the County Presidents of the Ladies' Committee of the Royal Horticultural Society's War Relief Fund attended an At Home at Lady Northcote's residence, 25, St. James's Place, S.W., on Saturday, June 16. The meeting was presided over by Lady Northcote, who gave a report of the work which had been done by the Ladies' Committee in securing subscriptions for the Fund. Lady Northcote reported that not only had the Committee been active in this country, but it had also been able to create interest in the Fund in the United States. The Right Honourable the Speaker gave a graphic account of the devastation in the region of the Somme battle field, which region he had recently visited. So complete is the destruction in that region that it is not possible for peasants returning to their countryside to discover either their homes or the boundaries of their land. All has been blotted out by the constant rain of shells. The Speaker insisted upon the need for a survey and the re-parcelling of the land, and drew attention to the fact that it must take years before the fertility of the soil is restored. Even in those places where the soil is not pitted with great shell holes the surface soil has been buried, and is not covered by infertile subsoil. Reports from Serbia show no less devastation. The Plum trees, which were the chief source of income of the peasants, have been systematically destroyed. Mr. Mackinder was able to speak as an eye-witness of the state of the ground from which the Germans have recently retired. Across that strip of land over which no battles had taken place the German army has effected a destruction even more complete than that on the battle fields. This foolish thoughtfulness has taken the form of razing villages and hamlets to the ground, so that nothing is left of them but the debris of the bricks of which the houses were once composed. But the act which will be excoriated so long as the German name is known is that of the destruction of the fruit trees. They lie in thousands in close ranks as they were cut down. Nor is it true that the destruction was designed to serve any military purpose. Hardly approaches so vast this method of act of destruction might yet further prejudice the name of Germany, the authorities caused a semi-official statement to be issued from Berlin to the effect that the cutting down of the fruit trees was undertaken in order that military use might be made of the timber, but Mr. Mackinder was able to demonstrate the clumsiness of the privation by pointing to the facts that the trees lie there untrampled, with every branch intact, and those that have not been felled have been ringed, so that the subsequent death of the trees is assured. Even the vines and Apricots and Plums on the walls, have been torn down and destroyed. Those whose hearts are touched by these accounts of damage done may rest assured

that the Fund which the Ladies' Committee is collecting will help not only to restore the pleasant land of France, but to kindle hope again in the desolate hearts of the peasants in the countries of our Allies.

WAR ITEMS.—MR. H. CORROYON, of Geneva, has contributed an article to the *Journal de Genève* on the subject of German devastation in Belgium and France. Basing his observations on Denteromyon, ch. 20 v. 19, he protests vigorously against the wicked destruction of the beautiful forest of Soignes, in Belgium, and against the mutilation of fruit trees in France.

—M. PIERRE LEVIGNE DE VILMORIN (the youngest son of M. MAURICE L. DE VILMORIN), to whom the War Cross for gallantry has lately been awarded (see p. 175), was mentioned in a despatch as follows: "On the 27th and 28th of March, 1917, having received the order to return with his gun only enough men to keep it in action, under a hot fire of heavy shells, himself took the post of gunner, showing complete indifference to danger."

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

HARDINESS OF SHRUBBY VERONICAS.—(pp. 229 and 230.) Veronica Traversi is usually considered to be the hardiest species, but I saw specimens killed outright in 1915. This year the species has escaped death, sheltered by hedges or bushes. Four dwarf and vigorous plants, close to where I write, have lost every leaf, though the branches are now sprouting freely. The site is fully exposed to wind, which caused the damage before the advent of snow. All the species of which I have experience require a considerable amount of assistance to support the charge, which was destroyed because the soil was frozen. Hitherto I have regarded *V. lobulodes* as one of the hardiest. For years past some thousands of plants have been grown in pots and boxes, for planting in the London district. So far I have not seen a live bush since the frost, except some very small ones on the shores of the Mersey Firth. With me, more than one variety of it have been killed. *V. Hartwegii* and *V. thoughii* (formerly *V. Amygdaloides*), *V. speciosa*, *V. lazaroensis*, *V. dussancti* in front of them have been killed outright. Thus I attribute to greater exposure, and it is borne out by the fact that *V. pumilodes* itself was partly killed on the outer or less sheltered side. *V. Turcomana* lost all its leaves on the larger branches, while the shoots at the base retained their leaves and are now growing freely. *V. Colensoi glauca* was killed *J. F.*

INSECTS AND BIRDS. I noticed in the issue for June 22nd remarks on the subject of insect pests by several writers who lamented their prevalence, "in spite of the severe winter." It is a common failing to think that a severe winter is bad for insect life; as a matter of fact it is just the reverse. Most insects are well equipped for withstanding cold in the particular stage in which each species is accustomed to hibernation. The severer and more prolonged the winter, the more complete is that hibernation, and the more do the natural enemies of insects die, either. When the winter consists of alternations of spells of mild weather and cold dry frost, it does not materially affect the birds, but the warm spells tend to rouse the hibernating insects to activity, only to perish in the succeeding cold snap for which they are not always prepared. Large numbers of insectivorous birds have perished during the recent winter. In addition to this, our authorities in their wisdom recommend us to kill sparrows and other birds just when they would be most useful; in spring and early summer, when their plumage would be full on destructive caterpillars and other insects. I fear that the crops we so badly need this year will fall victims to the devouring flocks of insects, and it is to be hoped that if there is a food shortage later on, we shall learn

the importance of setting the forces of Nature to control each other, which is the only proper way. America and Germany have taken in hand the subject of bird protection and conservation in a thoroughly scientific manner. C. A.

THE PEA WEEVIL. (See p. 222).—This insect has done much damage in our locality to early Peas. Market growers and allotment holders testify to the terrible crippling in some cases the actual loss—of all early sowings. In this garden four rows of Peas were sown on the same date on the same plot of ground, two dwarf rows alternating with two rows three and a half feet high. The dwarf varieties were spoiled, while the taller plants escaped. The damage was done when the Peas were just above the ground, early in April. It is difficult to understand why the two tall rows escaped unharmed. C. T., *Amphill Park*.

THE CATERPILLAR PLAGUE.—The caterpillar attacks seem to be gathering strength in Kent, and will have to be taken in hand more systematically if fruit is to be grown successfully. Opinions as to the value of grease banding as a preventive are very diverse. Only the Winter, Umber and March moths have wingless females, while the Pepper and Salt, Clouded Drab, and several varieties of Tortrix, have winged females, and all have been found on Apple and Pear trees. The difficulty of fixing any band on a tree in such a manner that the minute larvae hatched below the band cannot pass under it is very great, and on old trees one often sees large fissures by which even the female can ascend. Before any sound conclusion can be drawn as to the efficiency of banding, we must know what is the larva attacking the foliage, and how and where the bands were affixed. Kentish growers are in no doubt as to the success of arsenate of lead as an insecticide, and enormous quantities are used annually. My experience of four years' continued use of this specific on an orchard of dwarf trees is very hopeful. After several bad attacks, a gradual decrease in the number of pests has been noted, and this year, despite bad attacks close by, my trees were almost clean. My experience would lead me to believe that the moth does not travel far in search of a host plant, and that it should be regarded as a soil rather than an air pest. Fruit trees planted on fresh land remain comparatively clean for some years, even when adjoining infested plots. The danger of hedges as breeding grounds is shown in one plantation I have seen, where the hedges are riddled, and also the row of trees close to it, while further in the trees are untouched. *Southey Grove* refers to the susceptibility of certain varieties. This may be partly due to the fact that late-staying Apples are generally exempt from attack. I have noticed a curious case of a row of Peas, alternately Hessele and Chalk. The Hesseles are almost clean and bear a good crop, whilst the Chalks are nearly debilitated. S. B.

OLD SEEDS AND NEW. In the article on "Old Seeds and New," that appeared in the *Gardeners' Chronicle* on June 16, it is urged that economy should be exercised in using seed. A good deal of preventable waste occurs every year with expensive seeds such as Peas and Scarlet Runners owing to irregularity of germination, and the various causes the young seedlings are cut off according to the soil during their earliest stages of swelling and growth. For some years I have reduced the amount of seed used, and have secured a great improvement in the final result by the very simple expedient of germinating the seeds before sowing them. Several friends have also tried the game, and with uniformly successful results. The method is fairly obvious, and is known to practical gardeners, but there are at least beginners who have not tried it, and it is this circumstance which emboldens me to record my own practice. The seeds are soaked in water for about a couple of hours, and then spread out on a wet rough towel, which is folded back to cover them over. The whole can be conveniently placed in a meat dish and covered with a second inverted dish. It is important that the seeds should not lie in water, but they must have enough liquid to keep them thoroughly wet. When the radicles have protruded from about ¼ inch to 1 inch, they may be sown of course,

with the roots pointing downwards) in a prepared trench, the bottom of which should have been well soaked if the ground is at all dry. Under these conditions germination goes on rapidly, and in a few days they are above the soil. The whole process only takes relatively little time, and it means not only saving about 50 per cent. of the seed, but the final results are, so far as I am able to judge, always more satisfactory than those obtained by the ordinary practice of sowing. *J. B. F.*

AN APPEAL TO THE SEED TRADE.—The seed trade has for many years required an association that could do something for the mutual benefit of both employers and employees. Could not a meeting be arranged to form a committee and to appoint a permanent secretary who is thoroughly conversant with all branches of the trade, and who would receive a salary for his services. A subscription should be paid by all members, and these could be utilised for the benefit of employees who through illness or any just cause fall out of employment. One of the chief objects would be the finding of employment for those requiring situations, which would materially help the trade in general in recommending only suitable applicants, and this would be beneficial to employers. I should be glad to hear that there are men willing to promote an association covering the whole of the United Kingdom. As there are a great many men doing their bit at the present, something could be done to find employment for those after the present crisis is over, and thus it would be a great benefit to all connected with our trade if such a matter could be taken in hand at once. *Seedsmen, Gloucester.*

POTATO SPRAYING.—The Food Production Department, in the campaign which it is carrying on for potato spraying, is perhaps following too closely in the footsteps of the Irish Board of Agriculture, without having sufficiently examined the soundness of that Board's action, and I wish to point out the climatic differences in Ireland and in England. The material recommended by the Department is soda-Bordeaux, which the Irish Board has in recent years called Burgundy mixture, though I know not on what authority, for that name was applied by Gaillon in 1868 to an ordinary lime-Bordeaux of a particular strength; it consists of copper carbonate made by adding carbonate of soda to sulphate of copper, and was introduced by Masson in 1867, and used by Partington in that same year as a remedy for mildew of vines. At that time the nature of the reaction between soda and copper sulphate was not known, and Masson used 1 lb. of sulphate to from 1 to 2 of soda. Partington adopted a mean of these proportions, namely, 1 to 1.5, and further increased the actual strength of the mixture so that 4 parts of the sulphate should be used for every 100 of water. In 1909 an investigation of the reaction in question appeared in the *Journal of the Chemical Society* (reproduced in the 11th Woburn Report), showing that the copper carbonate produced had the formula $5\text{Cu}_2\text{O} \cdot 2\text{CO}_2$, acid sodium carbonate (bicarbonate) being formed at the same time, and that, consequently, the requisite proportions of the reagents were 1 of sulphate to 1.8 of carbonate. The Irish Board, however, made no alteration in the proportions which they had adopted in 1901, and our English Board is now copying them. These proportions are 4 of sulphate to 5 of soda, recently modified to 4.45 by the English Board, and they appear to be based on the relative molecular weights of the substances concerned, which are in the proportion of 4 to 4.6, thus implying a belief that it is the normal copper carbonate which is formed, CuCO_3 , a substance which any school text-book on chemistry would have taught is incapable of existence. At the same time, it may be mentioned, an actual strength in excess of that originally proposed, namely, 20 parts of copper sulphate to 100 of water, is being adopted. It was shown in the communication referred to that any alteration in either direction from the correct proportions of the reagents resulted in an increase in the amount of copper remaining in solution (though not to any large extent) till the proportion of soda was reduced below 1.51, and consequently, an increase in the danger of scorching the foliage, whilst the large amount of sulphate of

soda in the mixture further increases this danger, for, according to statements made, this substance has considerable scorching tendencies. Doubtless the heavy rainfall in Ireland would reduce the danger, but from certain remarks of the Irish Board in its *Journal* it is evident that it has not been entirely avoided even there, and might be serious in this drier climate. In any case, it is well to warn fruit-growers against using such a mixture on fruit trees. The Irish Board has published the results of trials with Bordeaux paste (now known as Bordrite), soda-Bordeaux, and ordinary lime-Bordeaux, the effectiveness found being least with the paste, and greatest with the lime-Bordeaux, whereas, according to our trials at Woburn these latter two gave practically the same results; indeed, the proportion of paste required for spraying was based on the amount found to be equivalent to ordinary Bordeaux mixture in such trials. These apparently discrepant results are not really contradictory, for the fungicidal value of different substances must necessarily vary with the climatic conditions under which they are used. One substance may have greater killing powers than another, but in a wet climate this advantage may be outweighed by the other substance possessing a greater adhesiveness, or containing a greater bulk of solid. Supposing that the above three substances gave the same results in England, a mere consideration of the bulk of solid in them would lead us to anticipate that their order of merit in Ireland would be that which it has been found to be there. This shows the unwisdom of basing recommendations for one country on experiences obtained in another, where the meteorological conditions are different. It is to be hoped that growers will be able to supply further evidence this year as to the comparative value of different fungicides, but they should be reminded that results must be based on the comparative yields of sound tubers; the mere appearance of the haulms is, as we have shown, an altogether fallacious guide. A word of warning as to soda-Bordeaux should be added, namely, to use it at once after preparation, for on keeping it, even sometimes for only a few hours, the carbonate changes to a dense deposit of malachite, and becomes useless for spraying purposes. Careful observation should also be made on the behaviour of subsequent crops in fields which have been sprayed. Copper is intensely toxic to vegetation, and the large dose applied in the case of soda-Bordeaux (24 lbs. of sulphate to the acre) may have a deleterious effect. *Spencer Pickering.*

HARDINESS OF VERONICAS AND OTHER SHRUBS.—I find that I omitted in my note (p. 256) to say that *Veronica luxifolia* has come through the winter unharmed, but in a sheltered position, while *V. catarractae* on a dry wall is dead, *Rhododendron intratum*, in a most exposed position, and not protected in any way, has surprised me by proving thoroughly hardy. In Mr. W. Watson's book, *Rhododendrons and Azaleas* (Present-Day Gardening series), p. 105, it is described as "tender." My plant has not lost a leaf, and is growing into a nice little bush. *Azalea Himodigma*, in the same position, has suffered badly. I thought it dead, but to-day (June 16) I see it is springing up from the base. After this winter I shall never again doubt the hardiness of *Carpentaria californica*. True, it lost some branches and looked a pitiable object for some time this spring. But it has made a rapid recovery, and will flower in July. *Azara microphylla* was punished severely, losing most of its side branches. The main stem is, however, quite unimpaired, and is now shooting out freely. Of the *Cotonasters*, *pyrenæica* (?) is, I am sorry to say, quite dead. *C. pamosa*, 20 feet high on an east wall, is unharmed. *Pyraeantha angustifolia*, which I understand has taken to itself yet another name, is even now looking miserably brown. *Evogy Cistus* in the garden save *ladaniferus* and *alsodesis* (now a mass of golden glory), has been killed, so has a very large plant of *Ericorhiza Wulfenii*. Young plants of this latter, however, have taken no harm, though given no protection. In the valleys below me, *Tea*, *H. T.*, and *Wichuriana* Roses have suffered severely, while hardly a plant has been injured here. I have only lost two standards, *Maman Cochet* and *Mme. Lam-*

bard; varieties like *W. R. Smith*, *Mrs. Aaron Ward*, *Edin Meyer*, and the *Lyons Rose*, grown in standard form and given no protection whatever, have come through unscathed. *Arthur R. Goodwin, Kidderminster.*

VERONICA LA SEDUANTE.—I agree with W. T. (p. 60) in what he says regarding this fine *Veronica*. At the same time, hardiness is a thing of degree, and if by experiment we find that any given shrub or other plant of ornamental value will live outdoors for three to five years in a given soil or situation, that plant is worth growing. I have not yet seen the plants of *V. La Seduante*, mentioned on p. 52, since the storm, but two fine bushes, $2\frac{1}{2}$ to 3 feet high, which have been flowering for some years past in a suburb of London, still look relatively happy. Some of the older leaves are browned, but the rest are green, flat, and in their normal position. If every plant that is not quite hardy in some part of this country were debarred from cultivation outdoors, that would exclude all the New Zealand shrubby *Veronics*, for I have seen *V. Traversii* killed in a sandy soil in the spring of 1895, though it was 3 feet high, and this is generally regarded as the hardiest of them. This would also exclude *Wallflowers*, *Antirrhinums*, and *Pentstemons*, and gardens would be the poorer. The temperature for five days in succession during the early part of February showed an average of 17.6°, with a maximum of 25°, yet I consider the degree of frost was not directly responsible for the damage. The ground was frozen hard before the advent of snow, and evergreen subjects, both shrubby and herbaceous, could not get sufficient moisture from the roots to support the foliage. I have seen *Prunus Laurocerasus*, 10 feet high, with every leaf hanging perpendicularly and limp. The variety *Veronica Diamond*, mentioned by W. T., is a very fine one, but I consider the scarlet *V. Simon Delaux* better. I have dried flowering specimens of both grown outdoors; also *V. lobeloides* and several forms of *V. Andersonii*, all of which have *V. speciosa* as one of their parents. My impression is that *V. lobeloides* is a more common plant around London than *V. Traversii*. *J. F.*

THE EFFECT OF THE WINTER ON INSECT PESTS.—During the long and trying winter some consolation was derived from the thought that the severe weather would put a check upon many garden pests. This idea would appear to have been based on a fallacy, for there does not seem to be any diminution in their numbers. Slugs and snails are just as numerous and voracious as ever, while complaints as to the damage done by weevils are heard on all sides. The white butterflies made their appearance in clouds, and their numbers suggest trouble with the various members of the *Paesia* family later on. The hot, dry weather has caused an outbreak of red spider, and that terrible pest *Lepo* (to the south-west of London), namely, the frog hopper, or cuckoo spit, is, as usual, dotting everything with its masses of slime. Even the *Rhubarb* is not proof against its attacks, almost the only subject immune therefrom being the *Delphiniums*. Complaints with regard to caterpillars, too, are very general, and I have often wondered whether the caterpillar plague is not partly due to the sparrows being so ruthlessly destroyed. I am aware that they do a good deal of mischief, but consider that they have some redeeming features, the destruction of green fly and caterpillars, for instance. They used to pull up many seedling vegetables till I followed the advice of a bird-loving friend to put plenty of water within their reach. *W. T.*

DAMAGE BY HAILSTORM IN LANCASHIRE.—On Sunday, the 17th inst., a severe hailstorm, accompanied by thunder and lightning, took place at Woolton, Gateacre, and Hunts Cross in the neighbourhood of Liverpool. The storm was from 15 to 20 minutes' duration. Trees, plants and glasshouses were badly damaged. In Mr. G. Tulloh's establishment at Gateacre about 600 squares of glass were broken, whilst other trade growers, including the Liverpool Orchid Company, Gateacre, report extensive damage. In the gardens at Bellevue Hall, Gateacre, from four to six hundred sheets of glass were broken. *R. G. Waterman, Woolton.*

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 19.—The usual fortnightly meeting was held on Tuesday last in the Drill Hall, Buckingham Gate, Westminster. The number of exhibits was well maintained, and all sections were represented. Several novelties were submitted both to the Floral Committee and to the Orchid Committee, the latter of which awarded two Awards of Merit, two Preliminary Commendations, and four Medals to collections. The exhibits in the floral section were the more numerous, and the Floral Committee gave four Awards of Merit, for *Trollius Ledebouri* and three varieties of *Sweet Pea* respectively. The highest medal award was made to a collection of *Delphiniums* and *Paeonies* shown by Messrs. KELWAY AND SONS, whose exhibits of these flowers are always of high merit. They showed a new variety of *Delphinium* named Admiral Cadigan, with a very large spike of cobalt-blue flowers flushed with mauve. The *Paeonies* included the beautiful single variety *Lena Ashwell*, like a pink coblet, with a cluster of golden stamens in the centre.

Roses, which are now the glory of every garden, were displayed in a wealth of variety of colour and form. Most of the Rose specialists had something new to offer, besides the old favourites, and on Messrs. FRANK CANN and Co.'s stand there was a sweetly-scented Rose called *Beulah*, of a rich red colour, and Mrs. Hugh Dickson, a large new sulphur yellow H.T. variety of great promise as an exhibition Rose. Mr. GEORGE PRINCE showed that delightful little Tea variety, *Shower of Gold*, the dark green, glossy leaves of which are almost as attractive as the blooms. He also showed *Düchaba*, a velvety-crimson single Rose of the Wichuriana type. Mr. ELSA HARKS gave great prominence to his novelties *C. E. Shea* and the climbing *Lady Hillingdon*, while Messrs. W. PARR AND SONS exhibited *Scarlet Climber* from plants in the open to demonstrate how well the colour is retained even in hot sunshine. Mr. W. EASTLEY had a stand of very seedling Roses, the best of which were *Mrs. Bayn and de Esoulet*, a H.T. variety of deep rose colour, shaded in the centre with bright red; *Footway Queen*, a lemon-yellow Tea variety, the inner petals margined with pink; and *President Wilson*, a full petalled shell pink bloom of fine build. Messrs. STUART LOW AND CO. showed a selection of the popular varieties, and had a separate exhibit of perpetual flowering Carnations. These flowers, which are now at their best, were also well shown by Messrs. ALFRED BROS., whose hybrid Pinks are very floriferous and a promising new break in border plants. The variety *Mary* is a good example of the type, some of the individual stems bearing a dozen blooms. Mr. J. C. ALFORD showed a fine group of border flowers, among which were many new varieties. Besides the *Trollius*, which gained an award, these were *Nasturtium Hooded*, with very refined foliage of delicate pink flowers arising from a cluster of long, narrow leaves, and *Senshu Przewalskii*, which has black stems and petioles contrasting sharply with the clear yellow flowers. The foliage is deeply lacinated and exceedingly handsome.

There were several exhibits of shrubs, both flowering and ornamental leaved. Mr. L. R. RESSER brought a varied collection of *Maules*, which formed a companion group to an exhibit of shrubs and climbers from Messrs. PIPERS. Several firms showed varieties of *Philadelphus*, and Mr. C. TRUSLER, of Slough, showed some of Messrs. Lemoine's choice hybrids, including *P. hybridus Lemoinei virginial*, which received a First class Certificate on June 20, 1911, and *P. Manteau d'Hermione*, which has smaller blooms so numerous as almost to hide the foliage. Most of the new *Philadelphuses* are white, but the petals of *P. purpureo maculatus* are blotched at the base with mauve-pink. The group of *Antirrhinums* shown by Messrs. W. H. SIMPSON AND SONS covered a wide range of beautiful colours. Mr. H. J. EWERS brought a number of rare plants from his interesting collection at

Colleshorne. They included a species of *Bomarea* from Peru, bearing a large lax umbel of rose-pink flowers, spotted in the interior with crimson; the dainty *Blandfordia principis*; *Dyckia rariflora* (a Bromeliad) with spikes of orange-coloured flowers; *Trenthalia Blandfordiana* (*Cyprinodium spectabile*); forms of *Orchis latifolia*; *Lilium sutchuenensis*; and *Iris Clarkei*.

Floral Committee.

President: Messrs. H. B. MAY (Chairman), J. Green, S. Morris, R. C. Nuttall, J. W. Barr, G. Renthe, J. Heal, E. F. Hazellon, E. A. Bowles, B. Hooper Pearson, R. W. Wallace, J. T. Bennett Poe, C. B. Fielder, J. Dickson, J. Hudson, W. J. Bean, C. Dixon, W. P. Thomson, W. Howe, G. Watson, J. W. Moorham, A. Turner, J. F. M. Lloyd, J. Jennings, W. H. Page, C. E. Shea, E. H. Jenkins, and G. Paul.

AWARDS OF MERIT.

Trollius Ledebouri. This magnificent Globe-flower has large expanded blooms of bright orange-colour, not so cup-shaped as the common *Trollius*. In the centre there are a number of filamentous processes of a rather deeper shade than the petals. The upper foliage is sessile, or nearly so, dissected almost to the base into five or six segments. Shown by Mr. J. C. ALFORD.

Sweet Pea Mrs. Tom Jones. A fine flower of deep lavender colour, shaded with mauve.

Sweet Pea Alexander Hood. Scented with intense tendency, beautifully scented. Both these varieties shown by Messrs. DOUGLAS AND CO.

Sweet Pea Elizabeth. A very refined flower of soft blue pink, the blooms carried on a gold spike. Shown by Messrs. ALEXANDER DREW AND SONS, Haymarket.

Groups.

The following medals were awarded for collections:

Silver First Medal to Messrs. KELWAY AND SONS, Langport, for *Delphiniums* and *Paeonies*; *Silver Second Medal* to Mr. J. C. ALFORD, Longley, for *Camellia* and other hardy flowers; Mr. E. HOES, Exford, for *Roses*; Messrs. W. PARR AND SONS, Waltham Cross, for *Roses*; Messrs. B. R. CANN AND SONS, Colchester, for *Roses*; Mr. L. R. RESSER, Richmond, for ornamental trees; Messrs. PIPERS, Basingstoke, for *Carnations* and *Alibon*; and Messrs. W. H. SIMPSON AND SONS, Birmingham, for *Antirrhinums*.

Silver Third and Fourth Medals to Messrs. ALFRED BROS., Weymouth, for *Perpetual Flowering Carnations* and *Hybrid Pinks*; to Mr. G. REITH, Kilmac, Kilmac, for *Alpine and Hardy Plants*; to Messrs. H. B. MAY AND SONS, Edmondton, for *Roses* and *flowering plants*; to Mr. G. W. MERRILL, Wexley, for *hardy plants*; to Mr. JAMES DOUGLAS, Great Bookham, for *Carnations*; to Messrs. CARRIS, Waltham Cross, for *Roses*; and to Mr. C. TRUSLER, Slough, for cuttings of *Delphinium* and other shrubs.

Bronze First Medal to Messrs. STUART LOW AND CO., Bush Hill Park, for *Roses* and *Carnations*.

Bronze British Medal to Messrs. H. CANNELL AND SONS, Exford, for *Roses* and *herbaceous plants*; Messrs. FRANK CANN AND CO., for *Roses*; Mr. GEO. PRINCE, Oxford, for *Roses*; and Messrs. B. TEPPER AND SONS, Oxford, for *Alpine plants*.

Orchid Committee.

President: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, and Messrs. Jas. O'Brien (hon. secretary), W. Bolton, J. W. Polter, R. A. Rolfe, Pautia Ralli, E. R. Ashton, J. Charlesworth, W. H. Hatcher, C. H. Curtis, Walter Cobb, C. J. Lucas, and R. Brooman White.

AWARDS.

AWARDS OF MERIT.

Odontiodes The Prince (Oda, Charlesworth) - *Odm. Adriani triumphans*, from G. W. BRID, Esq. The Manor House, West Wickham (see Mr. H. Redden). An interesting and pretty hybrid closely following the large-flowered

Odmontoglossums in size and shape in consequence of its having *Odm. Harryannum*, *Hannewellium*, and *triumphans* and crispum in its ancestry, with only one influence of *Cochlidia Noezliana* through *Odm. Chertsworthy*. The flower is of good shape and light lilac purple in colour, the lip being blotched with red-brown in front of the yellow crest. The *Odmontoglossum* parent was entered as *Odm. Ernesti*, but the name *Adriani-triumphans*, Charlesworth, 1906, takes priority.

Mittona Fairy Mary (Algebra x Blumina), from Messrs. ARMSTRONG AND BROWN, Orchid Nurst, Tunbridge Wells. A large flower with distinctly lobed white labellum, having at the base a broad purplish-rose mark extending wing-like on each side, and with thin, ruby coloured, radiating lines in front. The sepals and petals are white, the latter having a pale blue tinge at the base.

PRELIMINARY COMMENDATIONS.

Mittona Fairy Queen (Princess Mary x Fairy Queen Memoria G. D. Owen), from Messrs. ARMSTRONG AND BROWN. A charming seedling flowering for the first time and bearing one large, pure white flower of fine shape, with an almost copulidly sided triangular mass at the base of the lip, of ruby crimson colour, lighter between the short lines radiating from the margin.

Odmontoglossum Felicity (Olympea x odontoglossum), from Messrs. CHARLESWORTH AND CO. A promising seedling with a large and finely-formed white flower with clusters of red brown blotches in the middles of the segments.

GENERAL EXHIBITS.

Messrs. CHARLESWORTH AND CO., Hayward Heath, were awarded a *William's* Gold Medal for a magnificent group, in which their famous strain of *Mittona Charlesworthii*, *Mittona Lyth*, and other large-flowered *Mittonas*, of which there were over three hundred spikes, formed the chief display. *Odontiodes* and *Odmontoglossums* were well represented, the dark red *Oda Brown* giving effective coloring. Among the *Odmontoglossums* the new *Odm. harveyense aureum triumphans aureum x crispum* (Antistes) gave an interesting example of fixed characters of colour suppression in the parents being handed on to the progeny. *O. hexentense aureum* has creamy yellow flowers with darker yellow blotches, and without the brown markings of *O. triumphans* seen in the original natural hybrid.

Messrs. ARMSTRONG AND BROWN, Orchid Nurst, Tunbridge Wells, were awarded a Silver-gilt Flora Medal for an excellent and varied group of new and rare hybrids, among which *Mittonas* were in attractive feature. A fine selection of *Odmontoglossums* and brilliantly coloured *Odmontodes*; the emerald green and white *Cyprinodium Muehlsch. aureum* and *C. Holdenii*, and some white *Cattleyas*, including *C. Saturnalia*, were included in the collection.

Messrs. STUART AND SONS, St. Albans, were awarded a Silver Rankian Medal for a group of *Cattleyas*, *Laelio-Cattleyas*, and other, specially noteworthy being *Laelio-Cattleya General Pershing*, a fine white flower with deep purple lip of uncoloured percentage, and *L. C. Goffiana*, Imperator, a grand plant with two spikes of four flowers each.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, were awarded a Silver Rankian Medal for a group of *Laelio-Cattleyas* and *Odmontoglossums*. A striking new form was seen in *L. C. Vesuvius* var. *Aurora* (*Veronique x Haroldiana*), which has well formed flowers of a rose tinted copper colour with purplish-crested lip.

G. W. BRID, Esq., The Manor House, West Wickham, again showed *Odontiodes Aurora*, which received an Award of Merit on May 2, 1916. The margins of the sepals and petals are the colour, the greater part of the segments bearing large red markings.

Fruit and Vegetable Committee.

President: Messrs. J. Cheal (vice chairman), W. Jeffries, F. Perkins, E. A. Buryard, W. H. Davies, W. Pountney, E. Buckett, J. C. Allgrove,

A. Ballock, P. C. M. Veitch, Owen Thomas, W. Bates, H. S. Rivers, J. G. Weston, E. Holmes, W. Wilks, and A. R. Allan.

Mrs. VINCENT BARKS, Park Street, Grosvenor Square, London, was awarded a Silver-gilt Banksian Medal for bottled fruits preserved without sugar.

Mr. STEWARD, Panshanger Park Gardens, Hertford, showed large, solid heads of Cabbages Sutton's Earliest, Imperial Harbinger, and Flower of Spring, raised from seed sown on February 17 last, also Cos Lettines of the Dwarf Perfection type.

Mr. G. J. WHELPLEG, Chislehurst, showed the Newberry, a Rubus raised from the Loganberry crossed with the Raspberry.

Obituary.

LIEUT. H. L. FOSTER.—Keen regret will be felt by horticulturists, and especially those in Kent, at the news of the death in action on June 7 of Lieutenant Harry L. Foster. Second son of the late Mr. Charles Foster, who made a great reputation at the Reading University Gardens, Lieutenant Foster was educated at Reading Collegiate School and at the Wisley Laboratories of the Royal Horticultural Society. In 1915 he was appointed Assistant Horticultural Instructor under the Kent Education Committee, and in that capacity did admirable work until the outbreak of war, when he immediately asked permission to join the Army. Enlisting as a private, he fought bravely in several engagements before being wounded at the great battle of Loos in 1915. At the end of a long convalescence he was recommended for cadet training, and in the early spring of the present year he received his commission. Lieutenant Foster resided for a considerable time in Maidstone, and became a popular member of the Church Institute. Although a keen student, first of horticulture and entomology, and subsequently of military science, he was a versatile athlete. He had a singularly engaging personality, and was greatly beloved by all who knew him.

CROPS AND STOCK ON THE HOME FARM.

EELWORM IN OATS.

ALREADY I hear complaints that the oat crop is being attacked by stem eelworm, *Tylenchus devastatrix*. At the present stage of growth no remedy can be applied. An entire change of crop and deep cultivation are the best preventives. A dressing of gas lime in the autumn after the stubble is ploughed, allowing it to lie on the surface for two months, would do much to eradicate the pest. Sulphate of potash, if obtainable, would act as a corrective. Dressings of unslaked lime, soot, and even chalk, are also to be recommended. The oat crop should be followed by roots such as Mangold and Swedes, Rape, Vetches or Mustard.

POTATOS.

Where new seed tubers were planted, growth is satisfactory, the haulm being strong and of good colour. Although some plots of home-saved "seed" are promising generally, growth on these is weak and irregular. So far the results once more prove the advantage of a change of seed. Weakly growing plants would be improved by the use of sulphate of ammonia scattered along the rows at the rate of 1 cwt. per acre before earthing them up. Freeing the haulm from weeds and admitting air to the roots by stirring the soil will be time well spent with this crop. Where the plants are 6 inches high no time should be lost in earthing them up, as this is a means of conserving the moisture in the soil.

Wireworm is rampant in some plots where the soil is recently dug grassland. Whether this pest will attack new tubers, after disposing of the old sets, remains to be seen, certainly the haulm of plants growing in some newly-broken up plots has a distinctly promising appearance for a good crop.

WEEDS IN PASTURES.

Such weeds as Thistles, Docks and Ragwort are very troublesome in pastures this season. Cutting off the tops of the Ragwort causes it to spread all the more. Pulling the plant up by the roots is the only remedy; it is shallow rooting, and easily dealt with during wet weather. Continuous cutting of Thistles will check their growth, but not so Docks, the roots of which must be removed. Corn crops have been especially infested with Thistles and Docks this season, and where not removed the weeds are liable to increase in the future, as straw and hay used on the land as manure may contain the seeds of both weeds. *E. Molyneux.*

TOP-DRESSING FOR HAY.

Correspondence in certain papers suggests that farmers who have top-dressed for hay, or intend to do so in the future, with nitrogenous fertilizers, may be needlessly alarmed by exaggerated statements as to the dangers of such top-dressing. Some ardent men and hunting men and other owners of fast-working horses are well known to favour hay produced "naturally," as they call it, and to attribute kidney troubles in horses to hay forced into bulk by the use of rapidly-acting nitrogenous fertilizers. If there is anything in the theory or the prejudice at all—and a few cases are reported to have occurred where horses appeared to be injured by the use of such hay—the probable explanation was the excessive application of nitrate of soda or its very late application, or both excess and lateness of dressing. No well-founded complaint can be traced against hay from fields top-dressed at the proper time with a reasonable application of sulphate of ammonia. This is the nitrogenous fertilizer which will be generally used in this country this year and next, and for the supply of which to farmers at a fair figure the Food Production Department has made arrangements. The Department will gladly give further information about sulphate of ammonia, its use and cost, to anyone interested.

ANSWERS TO CORRESPONDENTS.

CUCUMBERS DISEASED: *E. F. C.* We cannot say definitely what is the matter with your Cucumbers without having seen them. The symptoms of *Cercospora melonis* (which we presume is what you mean by "spot") are that the leaves become spotted, the affected parts, sometimes an inch or more in diameter, being whitish or grey. Every affected leaf should be picked off and burnt, or the whole plant destroyed if the attack is very severe. Spraying with Bordeaux mixture is sometimes effective as a preventive, but careful cultivation is the best way of preventing attacks.

FIGS: *L. L. L.* On one Fig (the oldest) the fungus *Botrytis cinerea* was present; this tree should be grubbed up and burnt. The others are free from apparent disease, but have the appearance of suffering from some cultural defect.

GOOSEBERRY AND CURRANT BUSHES DYING: *J. H.* The Gooseberry bushes are affected with the "die-back" disease, *Sclerotinia Fuckeliana*. The Currant bush is affected with *Nectria rimbarrina*. The remedy is the same in both cases, viz., cutting out and burning all dead or diseased wood. This is far more effective than spraying.

BIRSES DISEASED: *M. P.* There are mistakes of the fungus *Gloeosporium* on two of the leaves sent, but it is not possible to say whether this is the cause of the disease unless younger leaves are sent. All the leaves showing the symptoms should be picked off and burnt.

LILIUM MARTAGON SPOTTED: *Doult Gardner.* The leaves sent were insufficient for examination. You should have sent more, packed in a box, not merely enclosed in a letter; they arrived very crushed.

LIME LEAVES GALLED: *Cambram.* The leaves are attacked by a gall mite, *Eriophyes trifae*. The trees will not suffer permanent injury from this pest.

MILITARY SERVICE: *E. B.* You say you have an appeal pending, but we presume you mean you

are making application for exemption, as it is at the Local Tribunal. If the application has not already taken place, we should advise you to take a friend with you who can confirm, if necessary, what you say about the extent of the ground you are cropping with vegetables. If, however, your application is refused, you can still ask permission of the local Tribunal to lodge an appeal at the Appeal Tribunal; and if permission is granted, there is some chance that you may still be exempted. If you have already appeared before the Local Tribunal, there may still be time to ask for permission to appeal, but you should do so *immediately*, or permission will not be given.

NAME OF PLANT: *H. W.* Your *Calceolaria* is in all probability a seedling from "Jeffrey's Hybrid."

PEACH LEAVES FALLING: *J. M.* The trees are attacked by the "Shot-hole Fungus," *Cercospora circumscissa*. Spray with ammoniacal solution of copper carbonate next season when the leaves are just expanding, and repeat at intervals. Do not use Bordeaux mixture, which is injurious to the leaves of Peaches.

PEAR LEAVES DISEASED: *D. H.* See reply to *P. S. H.* in our issue of June 9, p. 258. You have apparently used some kind of spray.

PLUM TREE: *J. H. S.* The Plum tree is evidently in need of a good dressing of lime in the soil round it. It appears to be suffering from an excess of feeding with strong manure.

POT POURRI: *W. P.* Take the rind of two Lemons (cut thinly), one pound of bay salt, one ounce of powdered Orris root, one ounce of Gum benzoin, one ounce of Cinnamon, half an ounce of Cloves, one ounce of Nutmegs, one grain of Musk, 12 Bay leaves, a few Sage leaves, Rosemary, and Lavender, cut small, one ounce of Lavender water, one ounce of Eau de Cologne, and one ounce of Bergamot. Mix all together in a pan, and add Rose petals in their natural state as they come into blossom. Stir frequently; at least once a day. Put into a covered stoneware pot with a wooden spoon to stir with. At the end of two months, the mass can be placed in Japanese Rose jars. From time to time throw in fresh Rose petals.

SHRIVELLED GRAPES: *G. P.* The temperature of your viney has been too high during the period of stoning, and the berries are affected with what is called "scabbing." The temperature should not rise much above 80° at such a time. This is difficult, with such bright hot weather as that lately experienced, but much may be done by temporary shading, abundant ventilation, and frequently damping the house while the ventilators and doors are open. The danger will be past as soon as the second swelling commences.

SLUG: *K. A. C.* The slug you send is the white form of *Arion equestrum*, which is commonly known as the black slug. It shows variations in colour, being sometimes red, brown, or yellow.

TOMATOES: *G. A. B.* Your plants are hopelessly diseased with bacterial wilt, and should all be destroyed. Spraying will be of no use whatever.—*Reader.* On one stem of your Tomatoes the fungus *Mycosphaerella citrifolia* was present. You should obtain from the Board of Agriculture, Whitehall Place, S.W., the leaf-let on Tomato canker caused by that fungus.—*H. W.* The spotting of the fruits is not due to any fungus; the specimen received was not sufficient for us to be able to say why the stem was rotten.

VINE ROOTS: *E. L.* The roots sent had the appearance of having been attacked by a "grab" of some sort, but without specimens it is not possible to identify it. Please send some the next time any are seen, securely packing them in a small box.

Communications Received: Sr E. G. L., C. F., R. L., J. D. E. A. B. W., Gloucester, C. H. C., Paul A., T. O. T. H.—M. A. E. F. A. S.—J. P. Sr A. B. H. W. S. R.—W. D.—L. F. B.—S. A. E. R.

MARKETS.

COVENT GARDEN, June 23.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand and they may fluctuate very freely from day to day, but occasionally several times in one day.—FOS

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their average wholesale prices. Includes items like Aralia Sieboldii, Asparagus plumosus nanus, Aspidistra, Cacti, Calceolaria, Cocos Weddelliana, Crassula, Erica, Fuchsia, Genomium, Pelargonium, and various other species with their respective prices per dozen or per pot.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers and their average wholesale prices. Includes items like Canterbury Bells, Carnations, Cereus, Delphinium, Gladiolus, Gypsophila, Heather, Iceland Poppies, Iris, Larkspur, Lilium longiflorum, Marguerites, Nicotiana, Orchids, and Viola.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage and their average wholesale prices. Includes items like Adiantum (Maidenhair Fern), Asparagus plumosus longiflorus, Carnation foliage, and Croton foliage.

REMARKS. Pyrethrums are almost over, and Pinky Bell Mistle and Mrs. Sinkins are taking the place of double white Pyrethrums. White Stocks are getting more plentiful, and a few bunches of magenta and pink are in the market. Hardy flowers are more plentiful, consisting chiefly of Achillea, Cornflowers, Cosmos, Galliasia, Delphiniums of various sorts, Scabiosa caucasica, Spirea, white and pink, pink and white Gypsophila, Cornflower Bell, Yellow Marguerite, and many and white Sweet Williams. There is a good supply of outdoor Roses, the most saleable sorts are Mrs. John Laing, Comtesse Testout, Frau Karl Druschki, General McArthur, and General L'Esperance. All indoor flowers are more or less offered by the best weather, especially Lilies, Clematis, and many boxes of Roses are almost useless when they reach the market. Lilies are now very low in price, but still of the Valley is most valuable. A few Tuberoses are beginning to arrive.

Vegetables: Average Wholesale Prices.

Table listing vegetables and their average wholesale prices. Includes items like Artichokes Globe, Asparagus, Beans Broad, Beetroot, Broccoli, Cabbage, Carrots, Cauliflowers, Cucumbers, Garlic, Herbs, Lettuce, Mushrooms, Peas, Potatoes, Radishes, Spinach, Turnips, and Vegetables.

Fruit: Average Wholesale Prices.

Table listing fruit and their average wholesale prices. Includes items like Almonds, Apples, Bananas, Cherries, Dates, Figs, Gooseberries, Grapes, Lemons, Melons, Nectarines, Nuts, Oranges, Peaches, Pears, and Walnuts.

REMARKS. A shipment of Australian Apples is to hand, packed in boxes of about 70 lbs. Some of the samples are producing record prices, as much as 90s. per box in our market. Oranges are limited in supply and very expensive. There are heavy supplies of Strawberries from all parts of the country, and are plentiful, and a very few are on the Grape. Most of Alexandria and Red Hamburg are much more plentiful. Outcrop Melons are available and Melons and Figs, both English and Channel Islands, are fairly plentiful. Supplies of Peaches and Nectarines have increased during the week. Cucumbers continue limited in supply, but varieties are increasing in number. Large quantities of English and Channel Islands Tomatoes are arriving daily. Peas and Broad Beans are fully increasing in number, and new Potatoes are plentiful. Cauliflowers and Cabbages are much in demand, but new Carrots and Turnips are plentiful. Asparagus is almost over for the season. E. H. R. Covent Garden Market, June 23.

THE ONLY DIRECTORY OF GARDENS AND GARDENERS.

The Horticultural Directory and Year Book for 1917 is the ONLY Directory that exists of gardens and gardeners in the British Isles.

If you want a list of all Nurserymen and Seedsmen, Sundriesmen, Horticulture Builders and other traders closely connected with horticulture, consult the ONLY Horticultural Directory.

Should you desire to trace the whereabouts of the young men you associated with in the Botany you have no other means of finding out their present addresses than by turning to the ONLY Directory of British Gardeners.

Obtain a copy and see if your own name is there, and if it is not, then send us particulars for inclusion in the edition for 1918.

The Year Book part of this unique volume contains descriptions of all the new plants, flowers and fruits certificated in 1916, notes on the principal gardeners who died during that period, and much additional information of great value to all amateur and professional horticulturists.

We are still able to offer some few copies of the current number. Readers are advised to send their orders early, before the work is out of print.

Apply, enclosing 1/4 for each copy required, to :-

SELECT LIST OF BOOKS ON GARDENING

To be obtained at the "GARDENERS' CHRONICLE" OFFICE from the Librarian.

Prices Quoted are in all Cases Post Free to any part of the United Kingdom.

- Botany, A Year's.** Adapted to Home and School Use. By Frances A. Kitchener. With 195 Illustrations. 5s. 4d.
- Botany, Elementary.** By Dr. E. Drabble 2s. 10d.
- Botany, First Course of Practical.** By G. F. Scott Elliott. Illustrated 3s. 10d.
- Botany, Lectures on Plant Physiology.** By Dr. Ludwig Jost. Translated by J. Harvey Gibson. Morocco back, gilt top. 24s. 6d.; cloth, 21s. 6d.
- Botany, Practical Plant Physiology.** By Frederick Keeble, Sc.D., F.R.S. Recommended for use in colleges and schools 3s. 10d.
- Botany, Structural.** By D. H. Scott, M.A. 2 Vols.
PART I.—FLOWERING PLANTS. 3s. 11d.
PART II.—FLOWERLESS PLANTS. 3s. 11d.
An excellent introduction to the Anatomy and Life Histories of Plants.
- British Plants, List of.** By G. C. Druce, M.A. A detailed list of Species and Varieties 2s. 9d.
- British Plants, The Uses of.** By Prof. Henslow. 4s. 9d.
- Bulb Book, The.** A Practical Work on Cultivation, Propagation, etc. By John Weathers. Illustrated 15s. 7d.
- Bulbous Plants, Beautiful.** By John Weathers. 5s. 4d.
- Bulbs and their Cultivation.** By T. W. Sanders 2s. 10d.
- Bulbs, The Book of.** By S. Arnott. Illustrated 2s. 9d.
- Calendar of Garden Operation, The.** Based on the original work compiled by the late Sir Joseph Paxton, M.P. Adapted to the requirements of Cottage Gardeners, Allotment Holders, and Amateur Gardeners, by members of the staff of the GARDENERS' CHRONICLE. Illustrated. (New edition in the Press) 1s. 3d.
- Cambridge Manuals of Science.** Cloth edition. 1s. 4d. each, post free.
- Plant Animals: A Study in Symbiosis.** By Frederick Keeble, Sc.D., F.R.S.
- Plant Life on Land.** By Prof. F. O. Bower. F.R.S., Sc.D.
- Earthworms and their Allies.** By F. E. Bedford, F.R.S.
- The Earth.** By Prof. J. H. Poynting. F.R.S.
- The Atmosphere.** By A. J. Berry, M.A.
- The Story of a Loaf of Bread.** By Prof. T. B. Wood, M.A.
- Bees and Wasps.** By O. H. Latter, M.A.
- Soil, The Fertility of the.** By E. J. Russell, D.Sc.
- Insects, The Life Story of.** By Prof. G. H. Carpenter.
- Carnation Culture, Commercial.** Edited by J. Harrison Dick. A collection of treatises by the best modern cultivators. Illustrated. 7s. 4d. (\$1.50).
- Carnations, Perpetual Flowering.** By Laurence J. Cook. A Practical Manual with Details of Cultivation. Illustrated Paper. 1s. 3d.; cloth, 1s. 9d.
- Carnations and Pinks.** By T. H. Cook, Head Gardener at Sandringham; James Douglas, V.M.H.; and J. F. McLeod. Contains 8 Coloured Plates, reproduced from colour photographs. 1s. 10d.
- Carnations, Picotees and Pinks.** By John Fraser. Fully Illustrated. 8d.
- Chemistry of the Garden.** By D. R. Edwards-Ker. A course of practical work designed for the use of Teachers and Students of Gardening. 1s. 8d.
- China, A Naturalist in Western.** By Ernest Henry Wilson. Illustrated, in Two Volumes. £1 10s. 6d.
- Chrysanthemums.** By Thomas Stevenson. With Chapters by Charles E. Shea and C. Harman Payne. Contains 3 Coloured Plates. 1s. 10d.
- Climbing Plants.** By W. Watson, A.L.S. With Introduction by W. Robinson, author of "The English Flower Garden." 2s. 10d. and 3s. 10d.
- Cocconut, The.** By Edwin Bingham Copeland. 10s. 6d.
- Cottage Gardening; or, Flowers, Fruits and Vegetables for Small Gardens.** By E. Hobday. 1s. 9d.
- Cucumber Culture for Profit.** By W. Dyke. A Practical Guide to the Cultivation in Frames and in the Open. 1s. 2d.
- Cyclopædia of Botanical Drugs, Potters.** By R. C. Wren, with additions by E. M. Holmes. Containing the Names and Properties of all the Herbs employed medicinally in this country. 5s. 10d.
- Cyclopædia of Horticulture, The Standard.** By L. H. Bailey. In 6 vols. Fully Illustrated in colour and half-tone. A valuable book of reference. Each part, 26s.
- Daffodils.** By the Rev. Joseph Jacob. With Preface by the Rev. W. Wilks, M.A. A full treatise on their culture for private and Exhibition purposes. With 3 Coloured Plates. 1s. 10d.
- Dahlias and their Cultivation.** By J. B. Wroe. 1s. 2d.; cloth, 1s. 8d.
- Dahlias.** By George Gordon, late President of the National Dahlia Society. Contains 3 Coloured Plates. 1s. 10d.
- Date growing in the Old World and the New.** By Paul P. Popenoe. Illustrated 9s. 6d.
- Dictionary of Hardy Flowering Plants** (see "The English Rock Garden," by R. Farrer).
- Directory, Horticultural** (see *Gardeners' Chronicle Horticultural Directory*).
- Diseases and Garden Pests, Book of Plant.** By R. Hooper Pearson. 214 pages. Over 65 Illustrations. Cloth, 2s. 11d.
- Diseases of Cultivated Plants and Trees.** By George Masee. 7s. 11d.
- English Rock Garden.** By Reginald Farrer, author of "My Rock Garden," "Among the Hills," etc. This work contains up-to-date monographs of the Plants suitable for cultivation in the Rock Garden. The text consists of 500,000 words. 300 Plants are Illustrated in Half-tone Plates. In 2 Vols. Price £2 2s. 10d. (in the Press).
- English Flower Garden, The.** An Illustrated Dictionary of the Plants Used, and Directions for their Culture and Arrangement. By W. Robinson. With numerous Illustrations. 15s. 7d.
- Ferns, The Book of British.** By C. T. Drury. Illustrated. 3s. 10d.
- Ferns, Choice, for Amateurs.** For the Garden, Conservatory and Stove. Illustrated. With full directions for their Cultivation, and Formation of Ferneries, Rockeries, etc. By George Schneider. New Edition. 3s. 11d.
- Fern Culture.** By A. Hemsley. Well Illustrated. 2s. 9d.

 SUTTON'S ORANGE BOBBLE, a variety of orange, per packet 1s.
 SUTTON'S CLASH OF GOLD, bright yellow, per packet 1s. 6d.
 SUTTON'S SUPERB, mixed pet. per packet 1s. 6d.

SUTTON & SONS, THE KING'S SEEDSMEN, READING.

SPRAY YOUR POTATOES.
INCREASE your crops and protect them from beet and disease by using **KEELING'S SPRAYING MIXTURE**. Keeps potatoes free from beet and keeps potatoes in a dry bag, when 25 quarts of water is enough to spray twenty bushels, and costs only 4s. 6d. per 100 lbs. The 6d. 2s. 6d. cartridge fits in the I. K. Sprayer. 7/3 1s. 6d. post free. Send P.O. order direct to the manufacturers, **KEELING & WALKER, LTD.**, 20, Milton House, Saffery Street, London, W.C. 2.

DICKSON'S HORTICULTURAL MANURE and other high-class Fertilisers, also Jackson's Improved Mushroom Spawn. Beware of imitations on application to **DICKSON'S Royal Seed Warehouse and Nurseries**, Chester.

BARR'S SEEDS FOR JUNE SOWING.
 Finest strains of Anthriscums, Apulgas, Cimicifugas, Canterbury Bells, Calceolarias, Chrysanthums, Delphiniums, Hollyhocks, Lupins, Pansies, Primulas, Stocks, Wallflowers, &c. Catalogue on application.
BARR & SONS, King Street, Covent Garden, London.

GREENHOUSE PAINTING & GLAZING.
 "Vitreoline," superior to White Lead Paint. "Plastine" superdries putty. Full particulars from **W. CARSON & SONS, Grove Works, Battersea.** Agents throughout the country.

WM. DUNCAN TUCKER & SONS, LTD., Lawrence Road, South Tottenham. Generalist. Wholesaler. Gardeners, Nurseries, Peach-houses, Potable Buildings, &c. Catalogues gratis.

CHESTER HORTICULTURAL COLLEGE—Women War Workers Short Courses. Through tuition in Fruit and Vegetable Growing by expert teachers. Apply, SECRETARY.

3S. 9d.—Spray Potatoes now with Bordeaux. Crown, reliable, effective, inexpensive; sufficient to spray 20 rods twice; full instructions; P.O.O. with order.
 G. L. MOORE, 27, Dalnallyn Road, Croydon, Surrey.

SPRING CABBAGES.—The best varieties to sow during the early part of August, or later at once.

SUTTON'S HARBINGER CABBAGE.
 The earliest Cabbage for Spring Cutting. Per packet 1s. per dozen 12s. 6d.
Try our Autumn Cabbages.—A trial of 10 cabbages than 114 stocks, represented 12 different sorts, was made at Witley last year, and it will be noticed that Sutton's Harbinger is the earliest of the lot, and is also the most valuable for winter and spring use. The Field, 7 June 17, 1916.
Cabbage Harbinger, a capital variety. I sowed some seed in July, and on January 10, 1917, I am reaping some lovely heads. Mr. A. L. Cotes, The Gardener, Wallingford, Oxon.

SUTTON'S APRIL CABBAGE.
 The most popular variety Cabbage for garden use. Per packet 1s. per dozen 12s. 6d.
 The April Cabbage is the earliest that will last year and give the most satisfactory results. It has been described in "The Field," 1916, and is now coming into service. The Field, 17 June 17, 1916.
 The April Cabbage, raised from seed supplied by us, is the most valuable of the early cabbages for garden use. Mr. H. B. Jones, Framfield.

SUTTON'S FLOWER OF SPRING CABBAGE.
 The most popular variety Cabbage for garden use. Per packet 1s. per dozen 12s. 6d.
 The Flower of Spring Cabbage is a well known variety, and is one of the most valuable in the collection. Mr. W. W. Wood, Epsom.
 I sowed a few of the April and Flower of Spring Cabbages in my garden last November. I pointed them out being, and in the middle of the year, they were still being found in the garden. The Field, 17 June 17, 1916.
 The Flower of Spring Cabbage is a well known variety. Mr. H. B. Jones, Framfield.

SUTTON & SONS, THE KING'S SEEDSMEN, READING.

SOW NOW—BATHS EMPRESS PANSIES, as grown for the Royal Gardens at Frogmore. The most beautiful and longest-flowered strain of Pansies ever. Per packet 1s. 6d. and 1s. 6d. post free for cash with order. Apply to **W. R. BATH, LTD.**, The Floral Farm, Walsley.

WATERER'S ALPINE, HERBACEOUS PLANTS AND WATER LILIES. Large stocks of the best and most popular varieties. Descriptive Catalogue free. **JOHN WATERER, SONS & CRISP, LTD.**, The Nurseries, Twickenham, Berks.

EVERY GARDENER'S LIBRARY contains a certain number of indispensable books. Some gardeners have a small library, others a pretty complete collection of modern books on cultivation, some have in the fortunate possession of books on every phase of each one, both old and new, from the early Herbals to the latest American Cyclopaedia. There is one little book which should be found on the shelves of every gardener, young or old, literate or ignorant, practical or theoretical, and which is consulted a thousand times a year by those who possess it. That is the "Herbicultural Dictionary and Year Book." There is so much in it, it is a valuable medium in prose. This year it is smaller than of old, because it has cut off a good weight of out-dated, old-time stuff, but it is steadily growing again, and is already having fresh names added, and old ones corrected, in preparation for the 1918 edition. There are still some copies left of the present year's issue. The price is 2s. 3d., post free. Do not let your library remain incomplete for lack of this indispensable volume. Send for it to the Librarian, "Gardeners' Chronicle," 41, Wellington Street, Covent Garden, W.C. 2.

SANDERS' Orchid Growers, St. Albans.

LANTON'S STRAWBERRIES.
FINE early pot plants for forcing or outdoor planting of King George V., Royal Sovereign, &c. pots 15s., 100s.; open ground, by 100s. Grand New Meteor, Lexington, pots, 20s., 100s.; open ground, 20s. 100s. Illustrated Catalogue, with cultural hints and description of all the new and older sorts gratis.
LANTON BROTHERS, Bedford.

GISHURST COMPOUND has over half a century's reputation for effectiveness in preventing and destroying Red Spider, Scale, Mealy Bug, Drop American Blight, Green and Brown Fly, &c. It is in boxes about 1lb., 5lb., and 12lb., by Dealers in Garden Supplies. Wholesale: **FRICES PATENT CAMPBELL CO., LTD.**, Battersea, London, S.W.11.

POTATO SPRAYING. On spot ready for immediate delivery. Sulphate of Copper 38 per cent. Washing Soda 38 per cent. Water for process quantity required per acre, 4s. H. RICHARDS, Borough High Street, London, S.E. 1.

OUR list of Vegetable Seeds, suitable for summer sowing, is now ready, and will be sent post free on application. **DOBIE & CO.**, Seedsmen to the King, Edinburgh.

ARMY BOOTIES (UNBOOTS), cost Government 2s. 6d. Selling now at bargain prices. Specially selected, without a blunder, as good as new. Unsuited for gardening, farming, and other work. Strong parts, post free. Sent on 10s. and 20s. sizes. Money returned if disappointed. Special conditions for quantities. **THE TRAMBS TRADING CO., LTD.** (Army Boot Dept.), 6, Eldon Street, London, E.C.

J. GRAY, LTD. Builders of Conservatories, Greenhouses, &c., and Heating Engineers, Drapers' Street, Clerkenwell, London, W.C. 2. Wire, 201, Western, London. Telephone, 204, Western.

THE GREAT POTATO SPRAY (third spray) protects your tubers with success. Finest remedy for Potato and Tomato Blight, Mosaic, Fungus, Caterpillars, and Diseases of all other Crops. One packet makes 5 gallons. Price 1s. 6d. or 12s. per doz. Spraying Cabbages, Wallflowers, Sweet Broad Beans and French Beans, &c. Keeps your Potatoes and wood the growing crop. Loads of every variety, good lines in Garden Boxes. All carriage paid. **LAND TROLL CO., Rt. Allport Street, Upper Baker Street, N.W. 1.**

GENTIANA Acoma, 12 large clumps, 5s. 6d. "Erie," 12 small clumps, 25s. 3d. "Hollis," 12 3/4 Butterfly Clumps, 25s. **ORRILL,** Royal Bull, Loughlin, Ireland.

MESSRS. ROBERT GREEN (1911), LTD., have a limited number of Standard and Pyramid Bay Trees to offer, in fine condition.—25, Coventry Street, London, W.

JAPANESE GARDEN UMBRELLAS. 400, various when opened, 7s. 6d. each, carriage paid. Japanese Sunshades, prettily coloured, 6s. 6d. per doz., 7s. 6d. for 6, 2s. for 3 carriage paid.—**ARCHER WOODFORD,** 3, Meeting House Court, Miles Lane, E.C.

NOTES FROM A GALLOWAY GARDEN.—VII.

Quia delectasti me, Domine, in factura tua et in operibus manuum tuarum exultabo. (Ps. xcii. 4).

It does not stir to unison with these words of the Psalmist. And such a June as is now passing amply atones for the rigours of April and blots from memory the asperities of the last half of May when the latter half brought to body to mind Disraeli's characteristic expression, "the radiant effulgence of spring." How gladly would every gardener compound by a severe winter for the absence of late frosts! We are now in a position to estimate pretty accurately the extent of loss caused by the severest winter for two and twenty years, in which years probably more exotic plants have been introduced to British and Irish gardens in the last time than in any previous period of equal length. The results will, of course, differ widely from each other, according to variation of soil, exposure, latitude, longitude and humidity; but a comparison of results cannot fail to bring out some facts serviceable for general guidance.

The garden in which the following lists have been compiled is on the south-west coast of Scotland, one mile or so from the sea, and 120 feet above it. Although the shade thermometer never registered more than 17° of cold, the frost continued with but slight intermission throughout January and February, accompanied by searing winds. Had that been all, we should have escaped scathless, but worse was to follow. It was the frost of March 7, 8, and 26, and April 1 and 2, that did all the damage. The following lists include only plants reputed to be of doubtful hardihood in Britain and those which have been introduced or distributed since 1395. The letter "w" is prefixed to the names of plants grown against a wall. No Rhododendrons have been mentioned, because the only injury sustained in that genus, besides the ruin of blossom on R. barbatum and R. procerum, has been to R. grande and R. bullatum, the growth buds of which were nearly all destroyed.

PRINCIPAL

Table with 2 columns listing plant names such as Aciphylia vitifolium, Saxifraga mammosissima, and others.

Table listing various plant species and their status, including w. Camptotheca indigo, Choisya ternata, Cordyline australis, etc.

Table listing various plant species and their status, including w. Mattia decurrens, Myrtus communis, Myrtus Lania, etc.

Table listing various plant species and their status, including w. Mattia decurrens, Myrtus communis, Myrtus Lania, etc.

Table listing various plant species and their status, including w. Camptotheca indigo, Choisya ternata, Cordyline australis, etc.

Table listing various plant species and their status, including w. Mattia decurrens, Myrtus communis, Myrtus Lania, etc.

In these lists there are but two or three plants which may not have been anticipated. It is strange that while the Spanish Broom (Spartium juncum) should have suffered severely, neither Carmichaelia nor Nothofagum should have turned a hair. Again, while Pieris formosa and P. japonica both escaped injury and flowered abundantly, our native Andromeda polifolia, originally brought from a sour peat moss in the same parish, has been hard cut. The cause for this may probably be traced in the luxuriant growth of the plant in garden soil, where it grows to a height of 15 inches, whereas in its native peat it never exceeds six. Some doubts have been expressed whether Romneya trichocalyx is more than a variety of R. Coulteri. It seemed at first as if our experience here indicated a specific distinction between the two, for whereas R. Coulteri is none the worse of the winter, both our plants of R. trichocalyx are no more. But when I was in Mr. Elwes' beautiful garden last week, where, in the Cotswold district the winter was far more severe than on the west coast, I found that R. trichocalyx had survived unhurt, while R. Coulteri had succumbed.

The most unexpected result has been that in Thamnocalanus Falconeri, for the leaves of this Bamboo are striated, which the late Lord Redesdale regarded as an invariable sign of tenderness, only those with a tessellated venation being hardy in the British climate (The Bamboo Garden, pp. 54, 55). I thought at first that the twenty-foot rods had been killed, for they shed their leaves, while the base of the plant remained green; but now they have put forth fresh verdure along their entire length. That charming bush or small tree, Xanthocheas sorbifolia, has never established itself as a favourite in north-country gardens, and we had written it off as one of those things that require stronger sunshine than we get on the west coast to cause it to flower freely. Thirty years ago or thereabouts two small specimens were planted here, which are now 10 and 15 feet high. As the years passed without any sign of blossom, we used them as supports for Rambler Roses and Clematis, mutilating the bushes sorely in the process. Suddenly, three years ago, both of them appeared sheathed with erect panicles of white flowers blotched with chocolate. Although these are carried on the old wood, which the cold and sunless summer of 1916 was ill calculated to ripen, yet both bushes are again flowering freely. This must be the effect of the warmth of last September. It looks as if Xanthocheas requires to reach a considerable age before flowering. Perhaps some of your south country readers can enlighten me. Even were it never to flower, this shrub is worth growing for its beautiful foliage. In 1915 Mr. Clarence Elliot gave me some seed of Clebanthus linifolius, commending it as a desirable thing to establish in order to sow itself about. It made no sign until May of the present year, when patches of agreeably soft lavender colour appeared in various places. I trust it has come to stay. For clothing an old wall there are few things more commendable than Erinus alpinus, which sows itself abundantly, and, being of humble stature, interferes with none of its neighbours; but far superior in colour to the type, which is mauve pink, is the variety called carmineus, clear rose in hue without a trace of blue. A chance colour harmony was caused by wood Forget me not, self sown round a bush of Rhododendron glaucum. Herbert Maxwell, Monroeth

The most unexpected result has been that in Thamnocalanus Falconeri, for the leaves of this Bamboo are striated, which the late Lord Redesdale regarded as an invariable sign of tenderness, only those with a tessellated venation being hardy in the British climate (The Bamboo Garden, pp. 54, 55). I thought at first that the twenty-foot rods had been killed, for they shed their leaves, while the base of the plant remained green; but now they have put forth fresh verdure along their entire length.

A chance colour harmony was caused by wood Forget me not, self sown round a bush of Rhododendron glaucum. Herbert Maxwell, Monroeth

ORCHID NOTES AND CLEANINGS.

ODONTOGLOSSUM MINOS

Flowers of this very fine Odontoglossum, raised between O. harveyense and O. Lambeanum, are sent by R. Ashworth, Esq., Ash Lane, Newchurch, near Manchester, with whom the variety first flowered in October, 1914. The flowers, which are large and broad petalled, have clear yellow sepals, heavily blotched with chestnut red, lighter yellow petals with one large and several small irregular blotches, and a broad, pinrose yellow lip with one large chestnut red blotch in front of the orange coloured crest. In the derivation, O. crispum, O. triumphans, O. Harrymanii, and O. Pescatorei are blended with excellent results.

ODONTOGLOSSUM CALYPSO.

Mr. Ashworth also sends a flower of this pretty yellow Odontoglossum, raised by Mr. De Barri Crawshaw, between O. triumphans and O. Lambeanum (crispum + Balfour), first shown by him in 1913. The plant then shown was nearest to O. Lambeanum, but the present variety has the features of O. triumphans very strongly marked. The sepals are bright yellow with clusters of reddish claret blotches; the petals are white with broad yellow margins, and two or three small claret coloured spots. The lip is reddish claret, with white base and margin and yellow crest.

INDIA.

ALLAHABAD FLOWER SHOW

ON February 24, 1917, the annual flower show of flowers, fruits, and vegetables was held in the beautiful grounds of Government House, Allahabad, and it proved a great success. Until I arrived in India I had no idea such luscious vege-

FIG. 96. FLOWER SHOW IN INDIA.

tables could be produced here. I have rarely seen such fine specimens of Lettuces, Carrots, Cabbages, Onions, Potatoes, Celery, Beet roots, and Artichokes. Tomatoes were also shown, some first class fruits being staged. The flowering annuals were arranged on the lawns, and these comprised a most attractive series. The first prize, for a group of 24 pots of annuals, was won by the Hon. T. C. Piggott. The group contained Clarkia, Schizanthus, Candy tuft, Brachycome (which makes an ideal pot plant), Dianthus, and Lobelia. Other annuals staged in their various classes embraced Mimulone, Mimulus, Asters, Stocks, Nemesis, Nasturtium, Phlox Drummondii, Larkspur, Nemophila, Leptosyne, and Antirrhinum.

In the tents were staged the foliage and flowering plants, including good Cinerarias. The Ferns made an excellent display, while the Crotons, Coleuses, Palms, and Aralias were worthy of special mention. Among the flowering plants I noted some finely grown Freesias, Begonias, Eucharis grandiflora, and lily-leaved Pelargoniums, while the humble Violet was also seen, although the perfume was not so pronounced as at home. Roses were a feature, but the outstanding exhibits were the lovely specimens of *Maréchal Niel*; never before have I seen them in such quantity or quality. They made an impression on my mind which will remain long after my sojourn in India is finished. What an exquisite Rose, and what a loss to English Rose-growers that it cannot be produced in such splendour in English gardens! Oranges, Limes, Cape Gooseberries, and Papayas were also shown.

Another notable feature of the show was the various exhibits staged by Mr. Head (an old Kewite), the hon. secretary and superintendent of the Government Parks and Gardens of Allahabad. They included Roses, a miscellaneous group of foliage and flowering plants, an effectively arranged exhibit of Sweet Peas, including many of the latest varieties; a fine collection of Cannas, showing a wide range of colour; and a large group of Freesias remarkable for their different tints and shades of red and pink. In fig. 97 will be seen some Sweet Peas grown in Khusrui Bagh, where Mr. Head

cultivates a fine collection of plants. The reader will gather from this picture that Sweet Peas in India are not far behind those at home.

The judges were Mr. H. A. Davies, Superintendent, Government Gardens, Lucknow; Gunner Briscoe, R.G.A., Bombardier, Langdon, R.F.A., and Gunner Conybear, R.F.A. As a result of the show Rs. 353 were handed to the St. John Ambulance Association. T. W. Briscoe, Fort Allahabad, India.

practically round, and absolutely distinct from anything I am acquainted with.

For providing early supplies of this favourite vegetable, it should prove of great worth. Cooked whole when small, the fruits make a tempting dish, the quality being first rate. E. Leckell.

THE HARDINESS OF BEET (see p. 242).

I have found Beetroots keep longest and in best condition stacked at the north side of a wall, with a covering of straw or litter during hard frosts, which is removed as the weather becomes warmer. Some amateurs have but little shed room, and this method will enable them to save as many roots as possible for winter use. One cannot imagine gardeners leaving crops needed for daily use in the ground during the winter, when the land should be cleared and dug as soon as possible. M.

WEEVILS.

I FIND the best remedy for the Pea weevil (which has been very troublesome in this district) is nicotine emulsion, sprayed on the plants in the evening. This has cleared the pests from the Peas and Broad Beans, and the plants have now recovered. I would also recommend it for the Turnip beetle or flea when ordinary remedies fail. H. H. M., Wiltshire.

VEGETABLE ECONOMY.

IN hot, dry weather, Lettices have a great tendency to bolt, making them unsuitable for salad purposes. They will, however, be found a good substitute for Cabbage if cooked in the usual manner. They should be used before they run too far to seed, or they will have a bitter taste when cooked. L. F. Bagg, Sunnyside Gardens, Holmwood.

CABBAGE.

FOR early spring Cabbage, sow the seed at the end of July, and plant out the seedlings when ready at a distance of 2 feet by 1 foot 3 inches each way. Also sow seeds in a box early in February, prick out the seedlings in a frame, and when large enough plant them between the early spring crops which have just been earthed up. The earliest Cabbages at cutting time should be cleared away at once, a fertiliser forked in the soil, and a fresh crop of some kind planted. Carrots should be sown between the spring sown Cabbage, the latter, when cut, to be followed by Lettuce or Radishes. John Bates, Meaford Gardens, Stone.

TOMATO TRAINING (see p. 251).

USUALLY the Tomato is trained as a single cordon. Verrier recommends that the main stem should be stopped above every second truss, the prolongation being obtained from the eye of the last leaf retained, and claims that fruiting is hastened and regularised thereby. With the single cordon, as age advances, innumerable side shoots have to be dealt with—at any rate, where the plants can only be allowed a sufficient height for four or five trusses. In the hope of avoiding this confusion and work last year, I grew some plants upon two stems, and certainly the difference in accessory shoots which had to be dealt with after a fortnight's absence at the beginning of September was very striking. The U trained plants hardly required any attention. In this way I got eight to ten trusses per plant; moreover the plants have a bigger root run, and fewer plants are required. This year I am trying alternate singles and U shaped plants, which seems, perhaps, the most economical arrangement. The plants are stopped at the second leaf, when about four have appeared; the upper shoot may want pegging down for equalisation of growth. The eyes at the bases of the seed leaves may be used; if the eye of the first true leaf is destroyed and the stem above it nipped off, the cotyledonary eyes shoot, and a Lopetle-like U is formed, but retardation of growth is rather greater than with the other plan. H. E. Durham.

FIG. 97. SWEET PEAS AT KHUSRUI BAGH, ALLAHABAD.

ON INCREASED FOOD PRODUCTION.

VEGETABLE MARROW BOTHERSIDE ORANGE

MR. F. HERBERT CHAPMAN kindly sent me a few seeds of this early Marrow last spring. We have grown it side by side with many other varieties, starting the plants in frames on a mild hot-bed. Both frames and lights have now been removed some time, and the plants are literally covered with fruits of medium size,

THE CELERY FLY AND PARSNIPS

More earlier than usual, the larvae of the Celery fly has obtained a firm hold on the Parsnip leaves, and unless remedial measures are promptly and widely undertaken, the crop will be at the best a comparative failure. In normal seasons Parsnips grow so freely that the presence of the maggot is not a serious matter, and concerted means of prevention and cure are not needed; but this year, largely on account of the drought, though, also, by reason of the unavoidable lateness in sowing the seed in the generality of allotments, the plants are only one-quarter of their usual size at this season, and the leaves are studded with the yellowish-brown patches which tell of the presence of the maggot. Usually the fly lays her eggs singly, though in considerable numbers, on the upper surface of the leaf, but this year I have found two maggots in many of the brown patches, so it would seem that the insect is determined to be exceptionally destructive. In a season favourable to the fly there may be half a dozen, or even more, generations hatched out, so that it is highly important to take immediate steps to combat the pest. Where the plants are small, the brownish patches should be squeezed between the forefinger and thumb to kill the maggot, but as in larger plants the loss of the affected leaflet is not such a serious matter, it may be removed and burnt. To prevent future egg laying, the foliage should be made distasteful by dusting it while damp with soot or powdered lime, or by spraying with Omista Extract or paraffin emulsion; but whatever is selected, the applications should be repeated at regular intervals until the danger is past. The application of a stimulant, either liquid manure, nitrate of soda, or sulphate of ammonia and superphosphate of lime, is also advisable in order to encourage the plants to grow as quickly as possible. In some gardens and allotments the fly has also attacked the leaves of Beet, therefore this crop should receive similar attention, that given the Celery and Parsnips. *F. C. B.*

EARTHING UP POTATOES

Comparatively little is said by writers on Potatoes about how much or how little earthing is desirable. I have usually given a slight earthing when the plants were well up, a second when about 8 inches, and a final one later. When the rows are close together (say 24 to 26 inches) the ridge of soil is much less than that obtained when the distance is 30 or more inches. It is clear that the yield per plant is generally greater with wider rows, and the question as to how far this may be due to deeper burying of the lower stem, and also to better drainage and aeration, seems possibly of some importance, especially in heavier soils, where the disposition to disease is rather greater than in previous sandy ground. In the Cornell trials (Roberts' *Fertility of the Land*, New York, 1911, p. 220, etc.), "inter-tilage" was in some cases repeated seven or eight times, and superior results were claimed; the "earth mulch" was kept up till late in the season, and seemed to be quite as beneficial in the late as in the early part of the season." At present it is not possible to get in amongst most of my main crop varieties where the rows are 30 inches apart and the height from bottom of furrow to top of ridge is about 6 inches, so that further cultivation cannot be done. A ventilation of the question of the effect of different depths of earthing would be interesting, if not important. *H. E. D.*

PRICES OF SULPHATE OF AMMONIA

The attention of manure mixers, agricultural merchants, co-operative societies and farmers is drawn to the advantages to be obtained from ordering sulphate of ammonia at once. Prices have been arranged with the manufacturers for the season ending May 31, 1918, in such a way as to give an advantage of £1 per ton to those who purchase before the end of September. Dealers and others having good dry storage accommodation should take advantage of this

offer. (1) The terms and conditions which will be applicable to the sale of sulphate of ammonia 24½ per cent. basis, in makers' single bags, net cash delivered to consumer's station in any part of the United Kingdom, in quantities of not less than two tons, are:—For orders placed with makers for delivery during the following periods: (a) June 1, 1917, to September 30, 1917, £15 7s. 6d. per ton. For this first period orders for 60 tons and upwards are to be placed by June 20 for delivery in Great Britain, and by July 10 for delivery in Ireland. Delivery in Great Britain must be in four equal monthly quantities, and in Ireland in three equal monthly quantities. Smaller quantities must be ordered before September 15. (b) October 1, 1917 to December 31, 1917, £15 15s. per ton. For this second period orders for 60 tons and upwards must be placed by September 10 for delivery in three equal monthly quantities either for Great Britain or Ireland. Smaller quantities must be ordered by the 10th of each month for delivery during that month (not January 1, 1918, to May 31, 1918, £15 7s. 6d. per ton. For this third period all orders, large and small, must be given by the 10th of each month for delivery during that month. The foregoing prices are subject to a discount for cash of 10s. per ton to manure mixers, agricultural merchants and dealers and co-operative societies. (2) Quantities of less than 2 tons will be supplied at the above rates, provided they form part of a bulked order of not less than 2 tons, so as to facilitate railway transport and avoid the wasteful use of trucks. (3) Where the purchaser takes delivery at the maker's works for conveyance otherwise than by rail the price will be 10s. per ton less. For sulphate of ammonia of higher or lower quality a difference of 3s. 5d. per ton is to be allowed in respect of each quarter per cent. above or below 24½ per cent. Fractional differences of less than a quarter per cent. will not be taken into account. Where makers require purchasers to provide their own bags the actual cost of bags at the time of delivery shall be allowed.

PROTECTION OF ALLOTMENTS.

Nearly twelve thousand acres of allotments are being handled under the Cultivation of Lands Orders in England and Wales, and it will be apparent that the value of the crops more or less intensively grown on this area is considerable, able in terms of cash and in terms of food for the people. The area occupied by allotment men otherwise than under the Cultivation Orders, of course, is much greater. There are 15,300 allotment holders, for instance, holding land from a single railway company, and 3,000 from another.

The problem of protecting the crops on allotments has been considered by the Food Production Department. Circumstances differ so widely that it is not possible to give advice equally applicable to societies or authorities all over the country on the best means of guarding allotment crops. It is desirable, however, to point out to all concerned that where land has been taken under the Cultivation Orders and a notice of the provision governing the matter is conspicuously exhibited, any trespass thereon becomes an offence under the Defence of the Realm Regulations, and anyone injuring or stealing his neighbour's crops is liable to a fine of £100 or a long period of imprisonment. As a rule, the patriotism and good sense of the citizens will doubtless prove a sufficient protection for crops on unfenced plots; but it should be made clear to other persons that they cannot thieftly tamper with our food supply without being visited by the severities of the law. Although allotments not taken under the Cultivation Orders are outside the scope of the Defence of the Realm Regulations, magistrates may be relied upon, no doubt, to do their best to safeguard general and specific interests against evil-doers. Patrols of members of allotment societies doubtless will be arranged as crops increase in value; in some cases the special constables will keep a watchful

eye on the local allotments. Day guards of school boys have been suggested, and some of the older lads might be utilised, although the ordinary small boy generally has his defects as a sentry. There are obvious objections to the use of young people as guards at night; and it is after dark that supervision is most needed, especially in districts where men work in shifts and there is much "broken time." In most places there are elderly men who would help guard either for patriotic reasons or in return for a small payment; and large allotment societies might well consider the desirability of subscribing funds for this purpose, the cost of which would probably be small.

OLD SEED AND NEW (see p. 255).

ABOUT twenty-five years ago part of our garden (previously a playground for children) was infested with slugs, and to prevent the pests eating the Scarlet Runners as they came above ground we adopted the plan of sowing the seeds in boxes of old potting soil, with a fair proportion of sand in it. This answered the purpose admirably, and it has been continued ever since. Though slugs have long ceased to be troublesome, there were some failures with Peas in the same soil. They rotted instead of germinating. This year I sowed seeds of Dwarf Beans, Canadian Wonder, Excelsior, Filibasket, and Mont d'Or (climbing). About 98 per cent. of the first three came up, and 95 per cent. made good plants, including a blind one which sprouted from the axils of the cotyledons. They were sown on May 12, placed in a cold frame, planted out on the 20th of the same month, and commenced to open their flowers on June 23, in spite of the severe battering they got from the hailstorms of June 16 and 18. About the middle of April I sowed seeds of a second early Marrow-fat Pea on an allotment, and next day they had snow upon them. Three-fourths of them failed to germinate. About the middle of May I sowed or planted Scarlet Runner, two seeds to each stake, to make sure of plenty of plants. More than half failed to germinate, and the same process was repeated. Even then we had to transplant some of the duplicates to avoid blanks. On the same allotment we sowed Brown Haricot Beans obtained from the Royal Horticultural Society, and, though most of them germinated a considerable percentage lost their heads by rotting just as they came through the soil. This was during drought or fine weather, and we suspect injury from ground insects and snake millipedes, of which *Julus pulchellus* is the most abundant. The Brown Haricot Bean was sold by growers in our district during winter, and more recently a similar variety with dark brown spots. The Beans are excellent cooked, though they contain a good deal of colouring matter. *J. F.*

BAUERKRAUT IN FRANCE.—It may not be generally realised that Sauerkraut is a very popular dish in France, especially in the North. Before the war most of it used to be imported from Germany; but the *Revue Horticole* tells us that a large factory near Paris has enormously increased its output since 1914. The Cabbages used are chiefly grown at Dammarin (Seine-et-Marne), and the manufacture takes place only in the last five months of the year. It takes about twenty days for the Cabbage to become sufficiently fermented, and the material used produces about 50 per cent. of its own weight in Sauerkraut.

PUBLICATIONS RECEIVED.—Good-keeping in War-time. By C. J. Davies. (London: George Newnes, Ltd.) Price 7s. net. (This is a booklet of about thirty pages, evidently written by a practical keeper. There is no preface, and we are not told why good-keeping in war-time is peculiar; but anyone desirous of acquiring one or more of these animals will find the book very useful.)—**Experiments with Humogen in Comparison with other Fertilisers.** A report of the tests carried out at Reading in 1916. By Martin H. F. Sutton. Price 2s. 6d. net.

The Week's Work.

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor.

CUCUMBERS IN FLAT PITS.—Cucumber plants in flat pits require careful attention in thinning and pinching the young shoots. Stop them at the first or second joint beyond the fruit, and remove all worthless growth to allow the light and air to enter freely. If aphids makes its appearance, fumigate the pits at once. Syringe the foliage with clear water twice daily in warm, sunny weather, but not in the afternoons in dull weather. Strong, healthy plants may still be planted in pits which have been occupied by Potatoes or French Beans; a supply of Cucumbers should be had from such plants throughout September and October.

FRENCH BEANS.—From a sowing of French Beans made now pods should be gathered about the middle of August. Use rich soil, and select an open position for the plants, allowing them plenty of room. The Belfast and Canadian Wonder are two good varieties for present sowing, and will furnish pods in the order named. Earlier plants will be benefited if afforded supports, and especially those planted in exposed situations.

TURNIPS.—A large sowing of Turnip seed may be made in late districts with a view to obtaining roots in late autumn. In gardens in the south, the middle of July will be soon enough for sowing. Frequent small sowings of Turnip seed should also be made in order to make quite certain of a crop, as much depends on the district on the success of autumn crops.

BET.—Beet raised from seed sown in the beginning of June is ready for thinning. Allow a space of at least 9 inches between the plants. After thinning, work the Dutch hoe carefully amongst the plants to clear the ground of small weeds. A sowing of Turnip-rooted Beet will still be made, and the plants should furnish nice roots for use in winter. Select rich soil for this crop, and thin the plants as soon as they are large enough.

CARROTS.—A sowing of Early Gem or early Scarlet Horn Carrot may be made forthwith with good prospects of a crop of roots for winter and spring supplies. Model is another suitable variety for present sowing, and the roots will retain their colour if left in the ground through out the winter for use as required.

WINTER GREENS.—No time should be lost in filling all available ground with winter crops. Broccoli, Savoys, and Hardy Cabbage should be planted in quantity, also Late Broccoli, Coleworts, and Christmas Drumhead Cabbage.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR DAVY, Abbots Wood, Godalming, Surrey.

PEACHES AND NECTARINES.—These are making very strong growths this season. All new shoots not required for next year's crop should be removed forthwith. On young, vigorous trees the remaining shoots can be trained in position against the wall by means of small lengths of Bamboo slipped in between the wire or branches. The plants should be split into small flexible pieces about a foot long, and, if collected in the autumn and dipped in some strong insecticide and tied in bundles, will last several seasons. Syringe the trees on all available occasions, every afternoon if possible, about 4.50 or 5 o'clock. If this is done very thoroughly, it will keep the foliage free from red spider. Occasionally the trees should be sprayed with an insecticide or some reliable wash; some stimulant should also be given occasionally. Too much manure at one dressing will sometimes cause irreparable damage, so little and often should be the practice. It must be borne in mind that only healthy trees will stand manuring; an unhealthy tree may be killed out

right if manured heavily at any time. Old trees will be quite resuscitated by suitable dressings.

GOOSEBERRIES AND RASPBERRIES should be netted as soon as the fruits begin to colour, or the birds will attack them. Place the nets high up on poles, so that one can walk under to gather the fruit or water the trees. Good, stout poles, with strong tarred rope strained across, will bear the netting very well, and will last for several seasons. If the nets are laid directly on the bushes, the shoots get through, and the nets are torn.

FIGS growing rapidly will be improved by a good watering with clear water, and trees carrying heavy crops of fruits should be given a soaking from the sewage tank.

FRUITS UNDER GLASS.

By JAS. HENSON, Head Gardener at Gimmershury House, Acton, W.

YOUNG VINES.—When young vines and others that have not yet reached the limit of growth have need of stopping, it is a good practice to compel the young growth after it has been topped to force the main bud to break. This bud would not, in ordinary circumstances, break until next year. By forcing it to break now it will be the means of plumping up the buds lower down the rod. These buds will not break of themselves, but the laterals will continue to grow. Do not continue to stop the laterals, but rather allow them to extend, so that all the available space is covered, but not to overcrowd. If have allowed the laterals to hang down when the growth has been free, far by so doing a greater amount of growth can be ensured without obstructing the light.

MELONS.—See that the last-sown batch of plants have all the light possible, so as to keep them sturdy and strong. These should be kept well away from any stock that may have red spider amongst them. Bottom heat will hasten growth, we know, but for this next batch most of the progress will be made whilst we have plenty of warmth from early closing. It is not now essential to success that fermenting material should be employed.

CHERRIES IN POTS.—With us this crop is now all gathered and the trees will without delay be put outside and be plumbed over the rims of the pots. Cherries like a little shade from trees in the open during a part of the day. Watering will have to be carefully attended to daily, and can be done with the hose. After plunging, an occasional dose of artificial manure will be applied, preferably one containing a good percent age of phosphates and potash. During hot weather a good overhead spraying should be given to keep insect pests in check. Thus treated, the foliage is retained well into the autumn in a healthy condition.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

THUNIA. As Thunias pass out of flower they should be removed to a cool, well-ventilated greenhouse, where the temperature does not fall below 55°. Expose the stems and leaves gradually to full sunlight, which will cause them to mature. The plants will need water at the roots occasionally for so long as the leaves remain green, but when the foliage commences to turn yellow moisture should be withheld gradually. Plants that are exposed to the sunshine and grown in a dry atmosphere are liable to attacks of red spider. To prevent such attacks they should be placed on their sides and syringed with a nicotine insecticide, or soft soap dissolved in warm rain-water. Thunias are easily propagated from the back pseudo-bulbs by cutting them through a joint into lengths of about 4 inches and inserting them in pots filled with a mixture of chopped Sphagnum-moss and silver sand. The present is the most suitable time to root these cuttings, which will soon develop roots and top growth, in a frame in the warmest house. Old plants that have failed to flower and with stems growing to an unreasonable length should have the points of the shoots pulled out, and receive similar treatment to those that have bloomed.

THE FLOWER GARDEN.

By W. J. GUINN, Gardener to Mrs. DEMPFSTER, Keels Hall, Staffordshire.

IRIS. Groups of Japanese Iris are at their best when planted at the sides of lakes, or streams, or in any damp situation where the roots can eventually reach the water. Although the roots should be kept in a dry state during winter, copious supplies of water are necessary continually during the summer. A rich, retentive loam suits them best, and established plants will respond to a mulching of decayed manure. To increase the stock, lift the largest plants and divide them directly after flowering. The Bearded Irises are very effective in large masses planted in the herbaceous or mixed border. These Irises like a retentive soil with plenty of moisture during growth. The plants do much better if they are divided and replanted every few years.

CARNATIONS.—As these are now pushing up their flower spikes, the stakes should be placed in position without delay. The wire spiral stakes are best, as no tying is required. Give the ground between the plants a dusting of some approved Carnation manure, afterwards stirring the soil with the hoe. Soft water and liquid manure properly diluted are excellent stimulants.

HERBACEOUS PLANTS.—The necessary staking and tying of herbaceous plants will demand constant attention. Use green stakes, as they are hardly noticeable. The plants are growing luxuriantly, therefore it is advisable to restrict and regulate the young growth to prevent overcrowding of the weaker-growing varieties.

BULBS IN GRASS.—Directly the foliage of bulbs growing in grass show signs of turning yellow, the long grass should be mown with a scythe, to allow sun and air free access to the bulbs.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHOTE, Eastwell Park, Kent.

STOVE CLIMBERS.—Amongst climbers requiring warm house or stove treatment may be mentioned *Alamanda* in variety, *Cissus discolor*, *Dipladenia*, *Stephanotis floribunda*, *Aristolochia*, *Clendendium*, *Gloriosa superba*, *G. Rothschildiana*, and *Thunbergia*. These all thrive when treated in the manner described for greenhouse climbers on p. 255—hanging loosely and gracefully from the roof. Climbers always bloom better if kept thinned out or pinched back. If in tubs or restricted borders, they require abundance of water during the growing season, and regular stimulants either from liquid manure or top-dressings of artificial manure. Young plants propagated this season should be potted as required. Do not allow them to become pot-bound until they are in their flowering pots, when they must be fed.

AMARYLLIS (HIPPEASTRUM).—Hippeastrums should be removed from the houses to a cool frame, standing on a damp ash bottom. Do not be in too great a hurry to dry them off. Continue to give them a moderate amount of water, with liquid manure at intervals. Ventilate moderately and shade the plants slightly during bright weather, in the hottest part of the day. When growth is complete, disperse with the shading, give more air, and gradually reduce the water supply. This assists in the complete ripening of the bulbs, which is necessary for their satisfactory flowering next season.

HYDRANGEA.—Late-flowering plants in pots, now in full growth, should be given plenty of water and stimulants. When coming into bloom, arrange them in the cool greenhouse or conservatory. If shaded from bright sunshine, the blooms will keep in excellent condition for a long time. *H. paniculata*, grown as a standard in pots, is especially good for associating with Palms, *Cordylines*, and other green plants in corridors and verandahs, as well as in the ordinary greenhouse. The same variety, as a dwarf bush, is useful for all decorative purposes. When grown in pots, and the plants are in full growth, abundance of water and plenty of feeding are necessary to ensure fine, clean heads of bloom.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C. **Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPOINTMENTS FOR JULY.

- WEDNESDAY, JULY 11—Southampton Royal Horticultural Society's Flower Show.
- TUESDAY, JULY 17—Roy. Hort. Socy's Com. meet. and National Carnation and Prosees Society's meeting at Drill Hall.
- THURSDAY, JULY 26—Royal Botanic Society meets.
- TUESDAY, JULY 31—Roy. Hort. Socy's Com. meet. and Show of Dry Bulbs.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 61.9.

ACTUAL TEMPERATURE:—Gardener's Chronicle Office, 41, Wellington Street, Covent Garden, E. 1940, 1, 1940, 1, 1940, 2, 10 a.m., Bar. 29.7; temp. 75.5. Weather, Cloudy.

How to secure the most effectual distribution of surplus produce is a problem which is vexing the minds of many people who are growing more vegetables than they require.

On the one hand there is the outstanding fact that their surpluses are needed to help to make good the general shortage of supplies; on the other hand, there is the equally cogent fact that owing to lack of expert labour and to decreased railway facilities it is difficult for the inexperienced to supplement the work of the ordinary distributing agencies. The difficulty of the problem is aggravated by the facts that many vegetable products are perishable, and that, coming in about the same time, there are likely to be temporary gluts, which will mislead people into believing that there is no risk of subsequent shortage.

It will be evident to anyone who has thought upon the subject that it is not possible to draw up a scheme for marketing which will be applicable to all localities. It therefore follows that the task of organising distribution is one which must be initiated by each community for itself. In not a few cases this is being done, and it is to be hoped that every local community will without loss of time give careful attention to the subject. In this the wholesalers and retailers engaged in the distributing trade could lend invaluable assistance to the State. Everyone is agreed that it is desirable for distribution to be carried out so far as possible through existing channels; but if it is to be effectual those channels must be broadened and multiplied so as to allow of compensation, so far as possible, for the decreased rail way facilities.

The problem in its broadest aspect may be stated thus: How to secure uniform distribution with the minimum of strain on

the transport system. Evidently local organisation of distribution can assist in achieving this object; but the local organisations require to be co-ordinated by some larger authority. Just as the Army has its Army Service Corps to carry out its work of distribution, so we require a National Service Corps to discharge a similar function for the Nation. The wholesale and retail distributing trade should be able to provide experienced officers for this service. National Service recruits for distribution of supplies could easily be obtained for the purposes of local organisation. An approximate measure of the vegetable foodstuffs available in each district could be obtained, and the regions which these foodstuffs were earmarked to supply could be delineated.

The staff of the National Service Supply Corps would co-ordinate the plans of neighbouring localities, and it could also do invaluable service in other ways. For example, it could issue ration-tables giving information as to the average quantity of each kind of vegetable sufficient for the needs of an individual. This, supplemented by instructions in the preserving and storing of vegetables, would enable the inexperienced to ascertain how much of their produce should be reserved for home consumption and how much might be liberated for distribution.

It may well be that there are simpler and better ways of dealing with this all-important problem, but what is certain is that it requires to be dealt with, and that speedily. No less certain is it that the problem is one which might not, and cannot be dealt with solely by a central authority. It is one to the solution of which each locality must make a contribution.

"BOTANICAL MAGAZINE." The quarterly issue, comprising Nos. 1562-1564 of the entire work, being the issues for April, May, and June, 1917, contains illustrations and descriptions of the following plants:—

RUBUS HETEROCARPUS, tab. 8704.—The fruits of this species of *Rubus* resemble a large Raspberry. The popular name is the Strawberry Raspberry, under which it is frequently seen at exhibitions. The stems only attain a height of about eight inches, and die down in winter, so that the plant is herbaceous, not of a true woody character. The plant has been grown in this country as *R. sorbifolius*, having been introduced from America under that name.

SAXIFRAGA HORTONII, tab. 8705.—A native of New Zealand, introduced into this country by Captain A. A. DOUGLASS SMITH. The species is tender, but has great promise as a conservatory plant. The flowers are white; the capitulum is sometimes two inches and a half in diameter. The lower leaves are pinnately dissected, but the upper ones are entire and sessile.

CHIRITA TRAILLIANA, tab. 8706.—This handsome Gesneriad is a native of China, and was discovered by Mr. GEORGE FORBES at an elevation of five to seven thousand feet in Yunnan. The species flowered in June in a greenhouse, and is apparently too tender to thrive out of doors in this country. The flowers are tubular, the face of the corolla bright violet, with yellow lines in the interior on a paler violet ground.

SAXIFRAGA MANSHURIENSIS, tab. 8707.—This species (see fig. 96) was described by Mr. W.

IRVING in *Gard. Chron.*, September 18, 1915, from specimens which flowered at Kow, the seeds of which were obtained from Messrs. REBEL AND KESSELERINO, Petrograd, in 1915. The inflorescence is a rounded panicle of white flowers, with orange coloured stamens and red pistils.

CORYLORHIZA WILLMOTTII, tab. 8708.—This new Chinese species is closely allied to *C. Veitchiana*, from which it differs in its pilose calyx and fruits, longer nectaries, and exserted red anthers. The raceme of pale yellow flowers is very attractive, and the foliage has purplish petioles, subtended by stipules of the same colour.

VANDA LUZONICA, tab. 8709.—This handsome Orchid is a native of the Philippine Islands, and closely related to *V. tricolor*. The most marked difference is in the colour of the flowers, the sepals and petals of *V. luzonica* being white, blotched with purple, and with a lip of the same colour.

PHYROLA ULGINOSA, tab. 8710a; **PHYROLA BRACKETATA**, tab. 8710b.—Both these plants are natives of North America. *P. ulginosa* has a spike of cup-shaped flowers, bright rose coloured outside, and pale pink inside, against which the violet stamens are conspicuous. *P. bracketata* bears a denser spike, and the flowers are more open, with yellow anthers and a conspicuous yellow style. Both species are suitable for growing in peaty soil, such as that of a bog garden, or near the banks of a stream.

PLAGIOSPERMUM SINENSE, FORMA BRACHYPODA, tab. 8711.—This Manchurian shrub was described in *Gard. Chron.*, February 2, 1907, p. 65. The flowers are yellow, and almost sessile; they arise in groups of three or four along the whole of the branch from clusters of linear leaves.

MYRSINE AFRICANA, tab. 8712.—This plant was first introduced from the Cape of Good Hope about the year 1691, in which year specimens were cultivated at Hampton Court. The flowers are inconspicuous, and are sometimes, though not often, followed by handsome purple fruits.

ÆSCULUS TURBINATA, tab. 8713.—The flower spike of this Japanese Horse Chestnut is exceedingly handsome; the petals are creamy white, with yellow blotches which turn pink with age. The foliage has been described as being the noblest of Horse Chestnuts, the leaves being sometimes 27 inches long. A tree in Westonbirt, Gloucestershire, has attained a height of 30 feet, and has a trunk measurement of 2 feet 9 inches.

STAPHYLIS AMHERSTII, tab. 8714.—This species is named in honour of Sir EVERARD IM THURN, who first found it in 1905 when visiting the Solomon Islands. The flowers are white, with pale yellow markings, and violet blotches on the lip. The scape is erect, and about three feet long, arising from an aggregation of long, narrow foliage.

CAMPANULA EMBERSII, tab. 8715.—See *Gard. Chron.*, May 12, 1917, p. 190, fig. 69.

DISANTHUS CERCIPOFOLIA, tab. 8716.—This very attractive plant is the only member of the genus, and belongs to the Hamamelidaceae. It is a native of Central Honko, Japan. Its chief attraction lies in the rich hues assumed by the foliage in autumn.

ACIPHYLLA.—We are indebted to the Kew Herbarium for the information that the photograph of *Aciphylla* from Sir EDMUND LOOPER's garden, reproduced on p. 235, represents the species *Colemanii*, not *spuriosa*, as printed. The former species has longer leaves than *A. spuriosa*, and makes a plant of larger growth.

WAR ITEM.—A bouquet of Mikado Carnations and Frank Dolly Sweet Peas, presented by Messrs. W. AND J. BROWN, Stamford, to the Peterborough and District Farmers' Branch of the Red Cross Society, and given by the Society to Mrs. G. C. FITZWILLIAM, was sold by auction, and realised the sum of £112.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

FUCHSIA SPLENDENS.—It may be of interest, in connection with the article on *Fuchsia splendens* by B. F. (see p. 245), to mention that plants at the base of a south wall here have come through the winter unharmed, and have now grown to a foot high. The plants have never had any protection, but are always killed down to the ground in winter. I have no doubt that *F. fulgens* could be grown successfully in many places in Great Britain. *Arch. Buchanan-Hopburn, Smeaton, East Lothian.*

GERMINATION OF PARSNIP SEEDS.—The reference in the issue for June 16 (p. 244) to

week or so after I had removed the second set. Where the line has not been run through the rows, occasional seedlings have appeared since, and as late as June 19 I pulled out a few inch high plants from among those left at the original thinning, and which are now nearly a foot high. The variety sown was *Maltese*. It seems pretty certain that the seeds were not all from the same crop, and the experience suggests that Parsnip seeds may retain their germinating power longer than we have believed. *Charles H. Curtis, Buxtonford.*

A GOOD WORD FOR THE HOUSE SPARROW.—*Southern Growers* and others complain of the damage done to the fruit trees by caterpillars. In last week's *Gardeners' Chronicle* *Southern Grower* states that the only birds he allows his

so clean. I keep the sparrows alive by feeding them when very sharp frost or snow prevails; and if there are some Chickweed patches left among the old cabbage stumps and winter greens the birds do no damage to my Parsnips or Lettuces. Bullfinches will not do any damage for three seasons; but blackbirds, blue tits and whitethroats are often troublesome. *Wm. Stanbury, Mount Fife, Walton on Thames.*

Obituary.

SIR W. C. MACDONALD.—By the death of Sir W. C. Macdonald, Chancellor and President of McGill University, Canada has lost one of its most generous benefactors. Sir W. Macdonald devoted much of his vast wealth to the promotion of education, and was particularly generous in assisting all schemes connected with rural and agricultural education. It was due to him that the great agricultural college at Guelph, the Agricultural Department of the University, was established, and Sir William also established "consolidated schools" in Ontario, New Brunswick, Nova Scotia, and Prince Edward Island, equipped for horticultural and manual training and household science. He was one of those men, not rare on the American continent, who have a genius for spending their fortunes lavishly for the benefit of their fellow-men.

J. HARRIS. We regret to record the sudden death of Mr. John Harris, aged fifty, a partner in the firm of Messrs. Harris and Matthews, seedsmen, of Abingdon. Mr. Harris came to Abingdon about twenty-five years ago as an assistant to Mr. A. Pritchard, and in 1895 joined Mr. F. W. Matthews, with whom he developed a large business in Bridge Street. He was much esteemed by horticulturists and others in the town and neighbourhood. He was an active member of the Abingdon Horticultural Society.

HERBERT T. KING. Mr. Herbert T. King, who was killed by a bomb during the air raid on London which took place on the 15th inst., was head of the well-known seed firm, Messrs. J. K. King and Sons, of Coggeshall. Mr. King was on his way from Coggeshall to inspect seed crops in Lincolnshire, and his train had just reached the station when a bomb fell on or him, exploded, and killed him instantly. Mr. King was accompanied by Mr. J. H. Millard, the general manager of the firm. Mr. Millard was not injured by the fatal bomb, but directly afterwards a second bomb wounded him on the back of the head, rendering him unconscious. Mr. King was known and esteemed throughout the horticultural world, and especially at Coggeshall, where the firm has been established for many years. He leaves a wife, with whose loss all will feel the most profound sympathy.

CROPS AND STOCK ON THE HOME FARM.

POSTURE OF ARABLE LAND FOR DAIRY COWS.

In reply to a correspondent, I may say that in the county of Hants, where pastures vary considerably in their quality for feeding purposes owing to the various kinds of soil, three acres per cow is the standard allowed for milk production; in some cheese-making districts, three and a half acres is allowed.

If the Hon. F. G. Strutt and Mr. Currie had given the Essex War Agricultural Committee (see p. 248) a few particulars as to what amount of arable land would be required, and what crops to grow in lieu of grass, they would have enlightened an inquiring public. A bald statement, by whomsoever it is made, does not convey the information desired. Some cowkeepers do not give their animals artificial foods regularly. I think it will be admitted that it is much more expensive to farm arable land for crops than for grass for cows. There are many foods obtainable from arable land suitable for cows, but the question of cost weighs considerably.

As to the various foods obtainable from arable land, a single cow will eat 60 lbs. Mangold per

FIG. 93. SANSEVIERIA MANSHURIENSIS. FLOWERS WHITE, WITH ORANGE STAMENS AND RED PISTILS. (See p. 267.)

the germination of Parsnip seeds reminded me of my experience this year. Assuming that, in consequence of the great demand, I might have to deal with seeds below the average in quality, I sowed somewhat thickly for this crop, and instead of sowing a few seeds in regular patches I sowed all along the drills. A very few germination took place, and I was able at the first thinning to leave plants at regular intervals of eight inches apart in each of my long ten yard-long rows. About ten days after thinning, I went to live between the rows, and was surprised to find a second crop of Parsnip seedlings growing between the larger plants. These were removed, and by themselves were sufficient to provide a good crop had there been no earlier seedlings. I was more surprised, however, to find a third crop of small seedlings a

leads to destroy are missed thrushes, black birds, and sparrows. If it had been some farmer with fields of corn I could have understood, but a fruit grower allowing the nests of sparrows to be destroyed, and even paying for their eggs, would be beyond my comprehension if I was not aware of the ignorance that prevails in many parts of the country in connection with the house sparrow. The house sparrow destroys more fruit tree pests than all the other birds combined, and never touches the fruit. He commences by searching the trusses of blossoms, then the young foliage and fruit. I scarcely ever need to spray my trees or bushes, except cherries for black aphids, and Plums sometimes for aphids, as the sparrows will soon clean them, if not too many for them. Travellers and others often ask me what I spray with to keep my trees

SALES BY AUCTION.

In Bankruptcy, By order of the Trustee... AIGBURTH, LIVERPOOL... PROTHEROE & MORRIS

THE reason why advertisers find the Gardeners' Chronicle so good a medium is that it reaches the best class of people, who are in the best position to do what is best for them, and who do not generally mind how much they spend upon a thing, provided it is the best that can be got. Our advertisers supply the best quality, and therefore they appeal to those who know good quality when they see it.

DEATH.

SPOONER.—On June 25, at Wood-lane, Hounslow, London, wife of Henry Spooner, of the Hounslow Nurseries.

SITUATIONS VACANT.

SPRING CABBAGES — The best varieties
to be sown during the early part of August.
Order at once.

SUTTON'S HARBINGER CABBAGE.

The earliest Cabbage for Spring Cutting.
Per packet, 1s. 6 per ounce, 1s. 6d.
This of Average Holdings. A very early variety on an
114 stocks, representing 94 sorts, was made at Wisley last
year. It will be noticed that Sutton's Harbinger is
the only sowing in the list, and that it is the only one
and sowing sowing "The Field," June 17, 1916, and
Cabbage Harbinger is a capital variety. It sowed
some seed in July, and now (January 10, 1917) I am
cutting some lovely heads. — Mr. A. E. Coles, The Gar-
deners, Walla Walla, Croydon.

SUTTON'S APRIL CABBAGE.

The most popular early Cabbage for garden use.
Per packet, 1s. 6 per ounce, 1s. 6d.
The April Cabbage you supplied me with last year
has done wonderfully well, hardly a plant has been
destroyed by the severe winter, and they are now coming
in very useful. — The Rev. E. J. Bruce, May 4, 1916.
The April Cabbage, raised from seed supplied by you
last year, was a wonderful. This year it is a lovely but it
pairs, and not one bolted. — Mr. H. Brought, Framfield.

**SUTTON'S FLOWER OF SPRING
CABBAGE.**

The most suitable for the general Spring crop.
Per packet, 1s. 6 per ounce, 1s. 6d.
My last of Flower of Spring Cabbage was well, with
a photograph, and weeks earlier than any others in this
neighbourhood. — W. Webb, 154, Darbying.
I consider your April and Flower of Spring the best
Cabbage in cultivation. Last September I planted 1,000
of them, and in the whole planting on there were but four
plants not true to character. The bulk of these are
being sent to the States through the Vegetable Products
Company. — Mr. P. H. Schley, Rockstown Gardens.

MANURE** and other high-class Fertilisers, also
Deacon's Improved Mushroom Spawn. Packed upon its
base on application to DECKSON'S, Royal Seed Ware-
house and Nurseries, Chester.

EVERY GARDENER'S LIBRARY con-
tains a certain number of indispensable books.
Some gardeners have a small library, others a pretty
complete collection of useful books on cultivation,
some few are the fortunate possessors of books on every
phase of gardening, both old and new, from the early
Herbals to the last new American Cyclopaedia. There
is one little book which should be found on the shelves
of every gardener, young or old, literary, scientific, or
practical, and which is consulted a thousand times a
year by those who possess it. That is the "Hortical-
tural Directory and Year-Book." There is so much in
it. It is a veritable mine of books. This year it is
smaller than usual, because it has cast off a dead
weight of out-of-date, obsolete names, but it is steadily
growing again, and is already having fresh names
added, and old ones corrected, in preparation for the
1918 edition. There are still some copies left of the
present year's issue. The price is 1s. 4d., post free.
Do not let your library remain incomplete for lack of
this indispensable volume. Send for it to the
Librarian, "Gardeners' Chronicle," 41, Wellington
Street, Covent Garden, W.C. 2.

BRITAIN'S GREAT CABBAGE."

WEBB'S EMERALD CABBAGE.
(For July and August sowing.)
Earliest, best, and most popular Cabbage in cul-
tivation. Beautifully free from any
scurfiness to "bit," 6d. and 1s. per packet,
1s. 6d. per ounce, post free.
Mr. G. Ellwood, Head Gardener to W. H.
Myers, Esq., Swanmore Park, writes: "I
should like to testify to the excellence of
your Emerald Cabbage; it is really a gem
for private gardeners or market growers
alike, and of splendid quality."

WEBB'S FAVOURITE CABBAGE.
Early medium sized heads, of splendid quality,
6d. and 1s. per packet, 1s. 6d. per ounce, post
free.

WEBB & SONS, LTD., The King's Seedsmen, Stourbridge.

free. — BRADFORD WOOLLEN CO., 71, Bradford.

THE reason why advertisers find the
"Gardeners' Chronicle" so good a medium is that it
reaches the best class of people. It is read by people
who do not greatly mind how much they spend upon
a thing, provided it is the best that can be got. Our
advertisers supply the best quality, and therefore they
appeal to those who know good quality when they see it.

600 GLASS CLOCHES, about 17in. dia
net; 50; 3-inch frames, 120; by 40, 6in.,

SALES BY AUCTION.

FRIDAY NEXT.
The small, but choice—

COLLECTION OF ORCHIDS

formed by Alfred Bousfield, Esq., of Bournemouth, who is reluctantly compelled to give up their cultivation. The collection consists mainly of ODONTOGLOSSUMS, and includes, amongst others, the following well-known varieties:

- Odon. crispum Pittauum
- “ “ Leonard Perfect
- “ “ Magnum Bonum
- “ “ Rossendale
- “ “ Imperator
- “ “ F. K. Sander
- “ “ Titus
- “ “ Princess May
- “ “ Luciano
- “ “ Cooksonianum
- “ “ Xanthotes
- “ “ Ardentsium Doris
- “ armainvillierense alba
- Also,
- Cattleya Maggie Raphael alba
- “ Trianae alba
- “ Gaskelliana alba
- “ Labiata Mrs. E. Ashworth

Choice Miltonias, Brassia, Cattleyas various, Lycaste Skim terr. alba, and other choice plants.

Great care has been bestowed on the cultivation of the collection, and the whole are in an exceedingly healthy condition. The sale thus affords an excellent opportunity of acquiring these rare and desirable varieties,

together with an assortment of orchids from various collections, including many in flower and bud.

MESSRS. PROTHEROE & MORRIS will sell the above at the Central Auction Rooms, 67 and 68, Cheapside, London, E.C. 2.

On Friday, July 13th, at 1 o'clock.

On view morning of sale. Catalogues on application.

FARM BAILIFF or BAILIFF and GARDENER for 12 s. of cottage, full particulars, **G. BENNETT & SON**, Hanwell, W. For full particulars, apply to **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

HEAD GARDENER, experienced, for 20 s. of cottage, full particulars, **A. R. Box 12, 41, Wellington Street, Covent Garden, W.C. 2.**

HEAD GARDENER, 25 years, practical experience, 12 s. of cottage, full particulars, **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

HEAD GARDENER, 44 years, full particulars, **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

GARDENER (HEAD WORKING) and GARDENER BAILIFF for 20 s. of cottage, full particulars, **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

GARDENER (HEAD WORKING), when in work, 12 s. of cottage, full particulars, **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

GARDENER (HEAD WORKING), 15 years, full particulars, **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

GARDENER (HEAD WORKING), practical (15 years), experienced, stone and greenhouse plants, (house) in Kent, full particulars, **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

GARDENER (HEAD WORKING) of the ground, 15 years, full particulars, **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

GARDENER (WORKING) when full particulars, **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

SITUATION OFFERED as **FOREMAN** in a nursery, 15 years of age, 12 s. of cottage, full particulars, **W. W. Box 10, 41, Wellington Street, Covent Garden, W.C. 2.**

DISCHARGED SOLDIER, partially disabled, 30 years, 15 years experience, 2 s. 4 wages, full particulars, **A. R. Box 12, 41, Wellington Street, Covent Garden, W.C. 2.**

YOUNG MAN wants work in Gentleman's Garden or Nursery, good wages, discharged; man only, age 20. **W. BAKER**, Tisbury, Dorset Road, Mottingham, Kent.

P. R. MURTON, Penton Gardens, Helston, Cornwall, can highly recommend young lady for Gardens Inside and Out; some experience; good worker; age 22.

A LADY GARDENER, one year's College training, requires post as **UNDER GARDENER** or in Nursery—**VERKIN**, Hazeleaves, Southsea-Weston-super-Mare.

TWO LADY GARDENERS wish Position as **HEAD** and **UNDER**, well trained and thorough experience, Inside and Out. Please state full particulars, **F. B.**, Box 11, 41, Wellington Street, Covent Garden, W.C. 2.

LADY GARDENER seeks re-engagement near London, 14 years' experience, Vegetables, Fruit, Flowers, Glass, single-handed, or with others, 2 s. 4 wages, cottage. **MISS FULLER**, 71, Dorset Road, Bath.

A LADY GARDENER, 2 years' training, requires re-engagement as **SECOND GARDENER** for a good Head, Hampshire or Sussex preferred; good wages, cottage, comfortable home, 1 s. 6d. essential. **GALBY**, 38, Cecil St. Station, Nottingham, Notts.

LADY requires Post as **UNDER GARDENER** some experience, **MISS E. RICHARDS**, Kenilworth Hill, Southampton.

TRADE.

AS HORTICULTURAL AGENT, TRADE MANAGER or **MANAGER**, 20 years, practical as personal large houses and Covent Garden Market; excellent references, age 44 years. **F. GILMORE**, High Street, Eastly, Kent.

MANAGER or FOREMAN: age 35; 22 years' experience, Budding, Grafting, Climbers, Roses, Fruit Trees, Ampelopsis, &c.—**discharged Army**, 2 s. 4 wages, good references. **H. W. BULLOCK**, Cottage, White Street, Hove, Worthing, W. Sussex.

OPEN for Engagement as **HEAD SHOP MAN**, Manager of Traveller; life experience, both wholesale and retail, over military age. Write, **M. A.**, Box 6, 41, Wellington Street, Covent Garden, W.C. 2.

SEED TRADE, SHOPMAN (HEAD) or FRANCHISE MANAGER, over military age, experienced in all departments. For references, &c., write **STUCHMAN**, Box 9, 41, Wellington Street, Covent Garden, W.C. 2.

SHORTLY OPEN for Engagement as **TRADE MANAGER, MANAGER** or **HEAD SHOPMAN**, 22 years' experience in all branches, wholesale and retail; age 22, good seeds in speciality. Write, **M. A.**, Box 13, 41, Wellington Street, Covent Garden, W.C. 2.

VARIATION OF FORM IN IRIS.

IN an article on teratology in Iris flowers by Miss Armitage (*Gard. Chron.*, Oct. 25, 1916) the conclusion is reached that flower anomalies are the outcome of a sporting tendency, or strong expression in particular individuals. Among crossed seedlings abnormal flowers often appear, those noted in the article being the most common, and my experience confirms her conclusion. The tendency to sport indubitably can produce malformations in characters of certain varieties, such as Queen of May and Grandeur, and is inherited to a greater or lesser extent in other seedlings, but it is not invariably seen in hybrids or some crosses giving perfect normal flowers.

Of the abnormalities noted, the two most interesting from the florist's point of view are the tetra-loom flowers and those with six equal and similar segments.

With regard to the former, nutrition seems to have some influence. In many varieties and seedlings, especially of the Pallada type, the first flowers at the top of the spike on the strongest stems are tetra-loomed, the succeeding flowers and those on weaker stems being all normal, with an occasional exception. In tetra-loomed, these tetra-loomed flowers, when perfectly regular, as they usually are, are often as beautiful and graceful as the normal numerous flowers. In the border they simply appear as large and fine flowers, and for notice the departure from the normal form until it is pointed out, but it is, perhaps, psychologically interesting that when it is real seed disapproval is generally expressed.

The "Clematis"-flowered Iris, with six segments alike, is more interesting, and though in appearance it departs even more from the typical form, seems to me to be beautiful in its own way. It is quite regular and uniform both in form and colouring, and if all the flowers of the variety are of this type. But even when this is practically the case flowers will always be found in which the modification is incomplete, and occasionally even quite normal flowers will occur, from which it appears that it is not a true varietal or Mendelian unit character, but rather a phenomenon of the same nature as polyploidy, as I have suggested in the case of the florist's Gladiolus. It is interesting to compare it with the florist's Gladiolus, and to observe in the Iris also how the changes in form, colour and markings are linked together with reference to their function. As in the Gladiolus, it is the inner segments or standards which are modified, being transformed into falls, assuming the same position, either spreading or hanging, and with the colour and markings

characteristic of the variety, and also developing a beard. The change then may be considered, apart from aesthetic considerations, as a progressive one, and even more so than in the Gladiolus, since the falls are more highly specialised than the standards, and whereas in the Gladiolus there is a less of colour marking in the Iris there is, besides the production of a beard, an assumption, or, at any rate, an increase in intensity of colour and markings, either absent or less developed in the standards.

It might also be useful to compare closely and critically the phenomena of doubling and polyploidy. I venture to suggest only one broad general contrast. The most common form of doubling consists in the conversion of the stamens, and even sometimes of the pistils, into petals, and may, therefore, be looked upon as a centripetal tendency. On the other hand, polyploidy very often occurs either in a transformation of the inner whorls of segments to the form and colour of the outer segments, or to an increase in number of these outer segments, and so appears to consist of centrifugal tendency in petal formation.

Reading the malformations noted in the article, another may be mentioned of a somewhat different nature, but which appears to be more definite, and to be inherited as a distinct unit character. In Iris *pallada* Mme. Chéreau, and several other Plectra varieties, the falls are cockled at the tips, and the blade is lopsided or laterally unequal. All the flowers are affected, though in varying degrees, and only very occasionally can a fall be found with perfect or nearly perfect falls. This malformation, or one more or less similar, also occurs, but, in my experience, more rarely, in varieties and seedlings of other sections of bearded Irises, and seems to be generally associated with the Plectra type. Among seedlings from Mme. Chéreau many will show similar malformed falls, but some cases are so marked that the whole blade is contorted and crumpled up and partly aborted, but only in those which also display the Plectra type of form and colour. Non-plectra seedlings from the same cross and the same pod of seed have normal flowers, with no cockling of the tips of the falls, though occasionally there is some crumpling or crumpling of the petals, and the blade is curved and lopsided. Although this may manifest a variation in so slight a degree in the best and worst Plectra varieties, that from a garden point of view it is negligible, it is always present when the form of the flowers is that of the Plectra type, and the only Plectra colour type that I have seen entirely free from it is one of the most flowers of the Variegata or Negatif type, that is, with oval instead of pointed falls.

The lopsidedness of the blade of the falls may be associated with this cockling of the tips, but is a much more general malformation; few, if any, bearded Irises of the Pallada type are free from it. It is, in fact, so general that perhaps it may be due to the development of the flower, and the folding of the segments in the bud, as the shorter half of the blade is always to the right. This imperfection in the individual flower is noticed by few, and, perhaps, does not detract from the general effect in the border, but it is an eye-sore to the florist. The fact is that, in the case of bearded Irises as in the making, and present for all their general beauty, there are none among the standard varieties that do not show some imperfection or other. Among the newer varieties there are some now, such as Monarque and Ed. Michel, and some of Sir M. Foster's later seedlings, that are approaching an ideal standard of form and colour. But what is more such as those who have given us the Amélie and Dadaïa, Chrysanthemum and Rose, to perfect the individual flower, and we may hope that among those who come back from the war there will be many to whom such work will appeal. A. J. Bliss.

THE MARKET FRUIT GARDEN.

QUITE an old-fashioned June has been enjoyed this season, for the first time for some years. The weather was mainly sunny, and either warm or quite hot, while rain fell abundantly at wide intervals, on two occasions accompanied by thunder and lightning. The heaviest fall was 1.24 inch, on the 28th, mainly at night. Very seldom is there so great a fall in twenty-four hours at my station, and on looking at my rainfall record, I have to go back to May 15, 1915, to find an equal or greater one; the measurement on that date having been 1.70 inch. In the interval the only re-calls of an inch or more are 1.22 inch on July 16, 1915, and 1.08 inch on November 12, 1915. Rainy though 1916 was, it did not supply one day's rainfall quite up to one inch. My total for last season was 5.5 inches, contributed on only seven days. The month ended with two days of overcast sky and a cold north-east wind.

APPLES DENTED BY HAIL.

Hail storms are uncommon in my district, but there was one on June 22 sufficiently heavy to dent Apples to a considerable extent, although it lasted only about ten minutes. This is the first time that injury has been done to my fruit by hail. The dented spots are now red in colour, and, no doubt, the spots will show up to the time of marketing the fruit. Whether the injury to the skin will affect the keeping quality of the Apples or not remains to be seen.

A DEFENCE OF THE SPARROW.

MR. Stanbury's eulogy of the house-sparrow on p. 254 is the first that I can remember to have seen, while I have read many entire denunciations of this bird, some of them based on systematic investigations as to the contents of birds' crops at different seasons of the year. Even the writers of the two essays on "Farm, Garden, and Birds: How to Protect Crops Without the Destruction of Bird Life," who were awarded the first and second prizes given by the Royal Society for the Protection of Birds in 1912, did not defend the house-sparrow. Mr. E. Parnell Jones, who was awarded the first prize, admits that it is necessary to keep sparrows in check by taking the eggs, as they multiply rapidly, have a wonderful faculty for adapting themselves to circumstances, and drive away very much more useful birds, such as swallows and martins. Mr. E. J. Platt, winner of the second prize, admits that the sparrow, as well as the bullfinch, eats the buds of Plums, Damsons, Gooseberries, and Red and White Currants. It is curious that neither writer distinguishes between the omnivorous house-sparrow and the valuable insectivorous hedge-sparrow. As Mr. Stanbury quite says that it is not the latter, together with numerous other birds, to which he is indebted for clearing his trees of insects? When he says that "the house-sparrow destroys more fruit tree pests than all other birds combined," he makes a statement which seems to me entirely unfounded and incredible. Certainly it is very far from the fact so far as my orchards are concerned, as there are very few common sparrows on my farm, although enough to do harm to germinating seeds in the garden and to fruit buds. Hardly any sparrows' eggs have been brought to me since the offer to pay for them, as well as for the eggs of blackbirds and mixed thrushes, was made.

AS APPLIED TO THE BOARD OF AGRICULTURE.

In connection with the suggestion as to the best plan of guarding against a recurrence of this season's devastation by caterpillars, it is desirable to call attention to the possibility of controlling aphids and Apple-sucker attacks by some operation. The suggestion was that of dipping the so-called "winter" spraying of Apple trees into the blossom buds were showing in clusters, but unopened, and adding arsenate

of lead to the wash. My further suggestion is that another addition should be made with the object of killing mother-queen aphides, and possibly newly hatched suckers. In experiments carried out at the New York Experiment Station in 1915 and 1916, it was found that aphides could be effectually controlled by spraying at the time indicated, before the pests had had time to cause leaves to curl, after which spraying against them had but little effect. The most successful addition to the winter wash of lime-

the leaves around the clusters of unopened blossoms in buds were showing about a quarter of an inch in length, it is important to avoid anything which would scorch them. It seems to me, then, that fruit-growers might well appeal to the Board of Agriculture to obtain a good supply of cheap nicotine from the United States, free from duty, if there be a duty on it. Lime wash would not harm the young leaves, if not applied when too hot, and lime-sulphur can be used at a safe strength. *Southern Grower*

Queen (syn. Ruby Gem), Eastern Queen (syn. Salmon Queen), Fire King, Veitch's Select of Yellow, and Veitch's Dark Red; there are various intermediate colours, such as Fairy Queen, Ivory White, and Ellen Willmott; the early varieties Phoenix and Yellow Phoenix are very useful for planting near a south wall, as they flower in December and January; the double varieties, when well grown, produce very large spikes of flowers in spring, and are useful for dotting in among dwarfed-growing subjects, such as *Violas Comtesse of Hopetoun* or *Belvoir White*.

A nearly allied plant, *Cheiranthus Allioni*, is a great favourite of mine, and was admired by everyone at Belvoir Castle for its bright orange colour and neat habit. *Erysimum compactum* is useful to give variety, and it gives an abundance of its clear yellow flowers, and is of neat habit of growth. Stocks cannot be relied upon to stand the winter north of London; if required for flowering out-of-doors they may be wintered in 4-inch pots, grown in a cool glass-house or pit, and freely ventilated, to be planted out in March. Stocks are appreciated by everyone for their sweet perfume; many varieties will give about 90 per cent. of double flowers. *Empress Elizabeth* is one of the best rosy-pink varieties; all of the Brompton varieties can be grown in this way. The new *Myosotis Indigo Queen*, should be grown in every garden; its habit is similar to *Royal Blue*, which it greatly excels in the intense blue of its flowers; *M. dissitiflora* is valuable in warm districts, as it flowers early, and *M. Ruth Fischer* is valuable for its fine, large flowers; both are more tender than the taller varieties. The pink-flowered sorts produce but little effect, owing to their washed-out appearance. For dotting in the centres of large beds the variegated *Honesty*, *Lunaria biennis variegata*, is very useful; owing to the purple colour of its flowers it looks best above a white groundwork, such as *Double Arabis*. The plant may also be associated with a dark-coloured wallflower, such as *Purple Queen* or *Dark Red*; the variegation of the leaves does not appear until the plant is preparing to flower.

All of the above should be sown in shallow drills 1 foot apart, and be transplanted when large enough; if the ground is dry it is best to water the drills half an hour before sowing the seeds. *W. H. Divers, "Westdean," Hook, Surbiton.*

THE ROSARY.

NEW ROSES AT BAGATELLE.

THE report of the annual trial of new Roses at Bagatelle, near Paris, has just come to hand. The Gold Medals have been awarded to two yellow Roses, one from Messrs. Permet-Ducher, named *Mme. Caristie Mattel*; the other from Messrs. Alexander Dickson, of Newtownards, viz., *Margaret Dickson Hamill* (see fig. 1). The judges report that both these Roses have shown, during the period of their cultivation at Bagatelle, all the points of good Roses, including continuous flowering from spring to autumn. Certificates were awarded to the following: *Mrs. Mackellan* (canary yellow), *Red Star* (brilliant red, from a Dutch grower named Verschmiedt), *Henriette* (hybrid Tea, orange-coloured, from Messrs. H. Merryweather and Sons).

In spite of difficulties of transit, seventy-six Roses have been received at Bagatelle this year to be judged in 1918. Two were from America, one of which has not yet flowered. The other, Los Angeles, was raised from *Mme. Sigmond Weber* crossed with *Lyon Rose*. It appears to be a valuable Rose, with the good points of both parents combined. *Imogen*, sent by Messrs. W. Paul and Sons, Waltham Cross, has maintained its pale yellow colour very well, even during the hot sunshine of the past few weeks.

FIG. 1.—ROSE MARGARET DICKSON HAMILL, AWARDED A GOLD MEDAL AT THE BAGATELLE TRIALS; COLOUR ORANGE-YELLOW FLUSHED WITH SALMON.

sulphur was a small quantity of nicotine, which is comparatively cheap in the United States, while its price in this country is almost prohibitive for the profuse spraying needed. Herein lies the great difficulty of carrying out the campaign against caterpillars, aphides, and possibly suckers also, in one operation, while also effecting the objects aimed at by the ordinary winter spraying. For no wash containing soap can be added to lime-sulphur or lime alone, because the lime coagulates the soap, rendering it innocuous to insects. So far as I know, there is no spraying stuff other than nicotine at once free from soap, fatal to aphides and suckers which it wets, and harmless to vegetation. As the best time for spraying was found in the American experiments to be when the tips of

THE HARDY FLOWER BORDER.

BIENNIALS FOR SPRING BEDDING.

SEEDS of biennials for spring bedding should now be sown; a few of each kind should be grown, if possible, in order to keep our good varieties, although, in these times of warfare, it is not advisable to grow as large a quantity as before.

Wallflowers failed in many places last winter; in others they did well. The chief points in their cultivation are to grow the plants hardily and not to sow the seeds too early; moving them in the autumn aids them to withstand severe weather, provided it is done early in November. The most distinct kinds are *Purple*

FOREIGN CORRESPONDENCE.

FOOD PRODUCTION IN COLORADO.

WHEN the United States declared war, it was clearly recognised that success would depend very largely on the farmer. One of the papers published a cartoon, showing a rifle, a spade, and a hoe, with the legend, "Take one." It is fortunate for the nation that this condition exists, in so far as it gives practically every able-bodied person an opportunity to do something of value in relation to the war. Although Colorado is so remote from the scene of hostilities, it is recognised that whatever it can do counts for ourselves and our Allies, and organization for food production and conservation is rapidly going forward. The Central Committee on Food Supply is in Denver, and each county has its own committee, under which numerous special committees are working. These are on Ways and Means, Finance, Organisation, Co-ordination, Publicity, Seed, Live Stock, Tractors, Farm Labour, Marketing, and Home Economics. Already the acreage under cultivation has been greatly increased, and in the towns vacant plots are being made into gardens. Lecturers from the Agricultural College are touring the State, teaching people how to put up fruits and vegetables for home use. It is well known that for years past large quantities of fruits and other products have been wasted, either from lack of pickers or inability to market them without loss. We expect now to see this material saved, and steps are being taken to organise college girls and other young people to pick and can fruit, and do other useful things during their summer vacation. Wherever possible, arrangements will be made for drying fruit. A considerable labour is being registered, and steps are being taken to place the workers where they can be most good for themselves and others. Business men and others are urged to work on the farms during their vacations, the Governor of the State setting the example.

In Boulder the war activities of the town are illustrated by a large map placed on an exhibit. A red flag shows every home from which a man has enlisted, a blue flag indicates a purchaser of a Liberty Bond the U.S. War Loan, and a green flag a new garden plot. In portions of the town it is hard to find room for the flags. I am informed that in Denver many nationalised Germans are subscribing freely to the War Bonds. There is great unanimity and singleness of purpose throughout the State, although our people must universally detect war as an institution, and are only willing to go into it because they see no honorable or indeed, possible alternative. *T. D. A. Cockrell, Boulder, Colorado.*

ORCHID NOTES AND CLEANINGS.

NEW HYBRIDS.

LABELO CYTILLYA CARMEN. An effective hybrid raised between *L. C. Demareeana* × *Doviana* × *L. purpurata* and *L. C. Welliana* × *C. Trianae* × *L. purpurata*, named Labeo-Cattleya Carmen, is sent by Messrs. Mansell and Hatcher, Rosvold, Yorks. The sepals and petals are silvery-white, tinged with pale lilac, and the broadly-expanded lip ruby red, shading to light purple towards the margin, the base being beautifully marked with branched, gold-colored lines.

LABELO CYTILLYA NYDIA. This hybrid was also raised by Messrs. Mansell and Hatcher between *L. C. Amazeana* × *C. maxima* × *L. purpurata* and *L. C. Lycidas* (*C. Schroderae* × *L. tenebrosa*). The large, rather narrow petalled flowers are of clear cowslip yellow, the labellum, which partakes much of *L. tenebrosa*, being purple with a white base, on which are thin purple lines. The flower is in effect a large and darker-colored *L. tenebrosa* Walton Grange variety.

NOTES ON CONIFERS.

XVII.—*CALLITRIS OBLONGA.*

FEW, if any, of the Australian Conifers are suitable for open air cultivation in these islands, except under peculiarly favourable climatic conditions such as prevail in the extreme south-west of England and in Ireland. At Rostrevor, where the climate is an ideal one for tender Conifers, Sir John Ross has had this rare Tasmanian species in cultivation out-of-doors for more than twenty years, and, so far as I know, it is the only plant of its kind in Europe. Sir John tells me he obtained the plant by chance many years ago under the following circumstances. A nurseryman in the vicinity of Rostrevor procured seed of *Abies amabilis*, he believes from California, and among the seedlings which came up were four of an unknown plant. The stock on the nursery was sold shortly afterwards, and Sir John purchased one of these seedlings, the other three being unluckily destroyed by a sharp frost soon after the sale. The one plant was put out in a sheltered spot at Rostrevor in 1875, where it grew fairly well, and as soon as it formed a branch was sent to Kew and the tree identified as *Callitris oblonga*, which had not previously been known in cultivation. How seeds of this out of the way Tasmanian Conifer came to be associated with Californian seed of *Abies amabilis* is a mystery.

The plant has been in the open air for about twenty-five years, and is now 14 ft. a little over 6 feet high, with a stem about 5 inches in diameter. The tree passed unscathed through the recent severe winter, and is in excellent health, though its habit of coming profusely every year probably checks its growth considerably. A seedling has been raised which is doing as well as, if not better than the parent tree, and is now about 7 feet high. I have heard of no other specimens in England or Ireland, which is some what surprising, as the seed from the Rostrevor tree germinates freely, and samples have been sent to various nurseries, as well as to a number of private growers.

The species is extremely rare in a wild state, being only known to occur in Tasmania. It was discovered by Robert Brown at Port Dalrymple, and on the gravelly banks of the South-Essex River, Linnecoston, in 1804. A specimen collected by Brown at Port Dalrymple is in the British Museum herbarium. This Conifer was subsequently seen there by other distinguished botanists, including Sir Joseph Hooker, whose specimens from Linnecoston, with notes and sketches for the plate which appeared in his *Flora Tasmaniae*, are preserved at Kew. It is also found by the St. Anne's River, near Avoca, Tasmania, always growing close to the bank. Known locally as "Native Cypress," *Callitris oblonga* is one of the smallest species of the genus, and, according to Baker and Smith in the *Atlas*, rarely attains a height of 25 feet, being more often a mere shrub 3 or 6 feet high, with an erect habit and dense foliage. The stem is rarely more than two or three inches in diameter. When in fruit this *Callitris* is easily distinguished from all the other species by the very prominent dorsal points of the cone valves.

Mr. Wallis's photograph (fig. 2) represents a branch from the Rostrevor tree, which Sir John Ross sent me two or three years ago. *A. Bruce Jackson, Kew.*

* *Callitris oblonga*, Rich., *Trans.*, 4, p. 135, t. 23 (1805) Baker and Smith, *Atlas of Australia*, 51 (1910), with *Atlas of Great Britain*, t. 1 in *Hook. Book Journ. Bot.*, 33, 142 (1850).

Phenicia australis, R. Br., ex Mirb., in *Mem. Mus. Paris*, XII., 74 (1825); non *Eufratica*, Hook., *L. Fl. Pers.*, 1, 533, t. 97 (1847); *Benth.*, *Fl. Austral.*, VI., 238 (1853); *P. Grangei*, Hook., *Son. Conif.*, 35 (1857); *Farlati in DC. Prodr.*, XVI., 62, 450 (1868).

NOTICES OF BOOKS.

"JOTTINGS OF A GENTLEMAN GARDENER."

THE gentleman who is responsible for these jottings anticipates criticism, and cares not how sharp it may be. But as he was to a large extent induced by the opportunity of friends to have them printed, and as the jottings are above everything remarks of an amateur of gardening written for the benefit of brother amateurs, he would be critic is dismissed before he is prepared to trace his victim. An old objector to whom I mentioned recently how professional gardeners are engaged in teaching cottagers the way to top their plots, laughed heartily at the idea of a gentleman's gardener being capable of teaching him anything. Similarly, one feels how inadequately a gardener is able to comprehend the expletives of an amateur. However, it may be remarked that, apart from certain limitations, there is not a little in the book that will be useful to the amateur cultivator of flowers. He will find what the author claims to be a new style of flower gardening, superior to anything in vogue. The chapters on stones for rockwork, and the notes on soils and manures, are among the best in the volume. The food question is treated in a chapter of two, in which the comparative values of vegetables as "feeding" plants, are discussed, and methods of employing them in place of flowering plants. Not that the author would ever be for Flora to Ceres, he would let them have a place together, with the latter predominating. *B.*

ON INCREASED FOOD PRODUCTION.

SPRAYING POTATOS AND THE EFFECT ON GREEN CROPS.

MASS allotment holders are in the habit of planting their main crop Potatoes in rows 50 inches or more apart, and putting out between the rows various kinds of green vegetables for autumn winter spring use. In spraying them in 1916 this year for the first time, some are doubtful as to the effect which Burgundy mixture or Bordeaux mixture may have upon them. Broccoli, Kale, Brussels Sprouts, and other winter crops. If the rules laid down by the Food Production Department are in force (2 lb. of copper sulphate and 2½ lb. of washing soda, to make 20 gallons of Burgundy mixture, not 10 only, as is often stated), and the spray delivered in the form of a fine mist, no injury should be done to the green-stuffs growing between. Where Cabbages and Lettuces are planted between the Potatoes, very great care must be taken to wash them well before eating, especially Lettuces, to be eaten raw. The spray stuff should not be allowed to fall on such crops at all if it can be avoided. All green-stuff must be thoroughly washed before eating, whether it is to be eaten raw, or cooked, or fed to stock. Immature plants of greens need cause no anxiety; the spraying should do them good rather than harm.

POTATO PROSPECTS.

GENERALLY speaking, the outlook for main crop Potatoes is excellent. A little disease has been reported in Ireland, and Wales also has had its highly susceptible cases, but throughout England as a whole the harvest is looking extremely well. From the more important Potato growing areas reports are uniformly satisfactory. In some quarters a disposition has been shown to undervalue the reserves rendered in supplementing the national food supply by the multitude of small growers who this year are cultivating allotments. An estimate, which errs on the conservative side because it calculates that the eight planted will, on an average, produce only eight times its own weight of crop, has just

Jottings of a Gentleman Gardener. By E. T. Ellis, F.R.H.S. (London: L. Reeve & Co. Ltd.) Price 3s. 6d. net.

been completed with reference to the allotments in and around Glasgow. On this basis these allotments will produce over 2,500 tons of main-crop Potatoes, which is ten days' consumption of the city at its highest recorded figures, and would provide a moderate supply to the inhabitants for a month. Glasgow is less fortunately situated in the matter of allotments than the majority of towns in the United Kingdom, and it is at least possible that the average yield will be twice that taken as a basis for the Glasgow calculation. On some ground that was before the war used for Association football in Yorkshire, the crop this year is stated to be likely to produce from 20 to 25 tons of Potatoes to the acre.

FOOD PRODUCTION SOCIETIES.

SOME of the Food Production Societies (of which the Norwich Food Production League is the best known) have organised practically all the gardeners and allotment-holders in a township. In some places the old Flower Show Committee or the Horticultural Society is co-operating in the work, owning a knapsack sprayer, buying seeds, tools, and fertilisers collectively, and setting up the beginnings of a system for disposing of surplus produce.

VEGETABLES AT FYVIE CASTLE.

THE gardens at Fyvie (a-tle, Aberdeenshire, the Scottish seat of Lord Leith of Fyvie, are now devoted wholly to the cultivation of vegetables, and the surplus produce is sent by Lord Leith to the Fleet and military hospitals. Mr. Simon Campbell, the gardener, is growing several new Potatoes raised by the late Mr. William Sim, Slack of Causeway, the raiser of the well-known early variety Duke of York. One named the Hero King is at least a fortnight earlier than Duke of York, and was ready for lifting on June 23, having been planted on April 14.

THE BEET FLY.

JUDGING by the fact that many insects are more numerous in some years than others, we must conclude that the weather during the previous or present year was favourable to the multiplication of the species that proves particularly troublesome. This year I have seen more plants of Beet attacked by the Beet and Mangold Fly, *Anthomyia betae* (Curtis), and had more specimens sent me, than I remember in any other season. The method of the injury is very similar to that of the Celery and Parsnip Fly, *Zephantia oenopordis* (Curtis) (see June 30, 1917, p. 261), and similar remedies would apply. I also suggest dusting the leaves of Beet with soot, or spraying them with strong-smelling Tobacco water, or N.L. All liquid insecticide, to prevent the flies from laying more eggs, because two or more broods are produced during the season. The first brood has already passed into the pupal stage, or commenced to do so by the third week of June. The pupa is small and reddish-brown, and may pass through its resting period in the leaves or in the ground, for the thin and pale patches of the leaves readily crumble in dry weather and set them free. Curtis got his first specimens of the insect from Surrey, and though the maggots destroyed the Mangold plant, he did not suggest any other remedy except pinching. He found his own Sugar Beet attacked, and employed boys to pinch the leaves, thus stopping the attack. The Beet Fly had not been much noticed in this country till 1860, when there were severe attacks over more than a thousand acres in various parts of England from the Solway Firth to Cheshire; yet Miss Ormerod said that "remedies seem to be little needed." In my opinion, the early attack is the worst to be feared, and the one that should be checked, because the loss of foliage to small plants may seriously affect the crop. The ground by autumn would get filled with pupae, while late-developed flies also hibernate. J. F.

THE KITCHEN GARDEN.

By J. DENN, Foreman Royal Gardens, Windsor.

TOMATOS.—Tomato seeds should be grown now to raise plants for fruiting in late autumn and winter. Sow the seeds thinly in pans containing fine soil, which may consist of a mixture of two-thirds loam and one-third sifted leaf-mould. Place the seedlings in a position near the roof glass in order that they may grow sturdy, and as soon as they are large enough for transplantation pot them singly into small pots. Later, they should be transferred to 6-inch pots, and grown in a cold pit, where plenty of ventilation can be given them. Remove all the side shoots and stake the plants at an early stage. When they are of a sufficient size, they may be potted carefully into large, well-drained pots. The soil for the final potting may consist of three-parts turfy loam, one-part decayed horse-manure, and a good sprinkling of bone meal. When the plants are thoroughly established in their fruiting pots, they should receive plenty of light and air; if house room is limited, they will succeed in the open, provided the weather is favourable. Plants which are carrying a crop should be given a liberal supply of liquid manure or a surface dressing of guano previous to watering. Pinch off the side shoots and remove useless leaves. Ventilate the house freely on warm, sunny days.

MUSHROOMS.—To have Mushrooms in September and October, collect and prepare the materials for the first bed. Horse-droppings should be collected daily and placed in a dry, open shed, where they can be turned every other day, until a sufficient quantity has been obtained. If the manure is allowed to become sour through want of attention, the prospect of a successful crop will be very slight. Mushroom beds at this season should be in an open shed facing north; the sides may be protected from wind by mats, if necessary. The bed should be at least 14 inches deep, and trodden or rammed tightly. When the temperature of the bed is 80°, and not likely to rise, the spawn should be inserted two inches beneath the surface, and the bed made firm by beating with a spade. After a few days, a covering of fresh loam should be spread over the surface to the depth of one inch. If the bed begins to cool, a light covering of straw will help to retain the heat, and prevent evaporation of moisture. In order to maintain an unbroken supply, fresh beds should be made at intervals of three or four weeks.

LEEKS.—Leeks which were planted early in May should be given liberal supplies of manure water at the roots. Keep the soil stirred between the rows, and draw a little fine soil up to the stems as it becomes necessary. Leeks should be planted for spring use as ground becomes vacant until the full quantity has been put out.

SHALLOTS.—The cloves are ready for lifting. Place them under cover until they are thoroughly dry before removing them to the store-room.

CELERY.—Continue to plant Celery as the plant becomes ready. Give liberal supplies of clear water to plants growing in the trenches, and dust them lightly on frequent occasions with soot. Overhead syringings during dry evenings will do much to promote clean, healthy growth.

VEGETABLE MARROWS.—Marrow plants need plenty of water at the roots during hot weather, and weak liquid manure from the farmyard may be given twice weekly. Keep the growth moderately thin by removing all worthless shoots and leaves. Cut the fruits before they become very large; if not required for immediate use, store them in a cool cellar.

CHICORY.—The latest batch of Chicory should be ready for thinning, and this is best

done while the plants are very young. Afterwards hoe the ground between the rows lightly, in order to destroy weeds. Water the crop freely in dry weather.

ONIONS.—Onions which were transplanted in April with a view to producing large bulbs should be freely supplied with a weak stimulant. Soot is an excellent fertiliser for this crop, and should be dusted along the rows during showery weather.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVEY, Abbots Wood, Godalming, Surrey.

RECENTLY GRAFTED TREES.—Where the grafts are growing freely, the ties may be loosened to allow for the swelling of the wood. Keep the shoots tied securely to the rods or stakes. Remove all root suckers from the base, and shoots that are growing below the point where the scion has been inserted. If the roots are dry, water them very thoroughly, and afterwards spread a mulch of littersy material over the soil. The watering of trees ought not to be deferred until it is absolutely a necessity.

SUMMER PRUNING.—This operation may now be completed. The trees and fruit gain considerably in a very short time by having superfluous growths cut away. The shoots should be taken off with a sharp knife about three to five eyes from the base, taking care to make clean cuts. Apples, Pears, Plums, Cherries may be treated similarly. There are a few varieties of Apples and Pears which bear fruits on the end of the shoots, and these must be treated accordingly. As soon as the work of pruning wall trees is finished the shoots that are left should at once be nailed in position, or they may get broken. Give the roots a good watering when the operation is finished, and vigorously syringe the foliage.

YOUNG STRAWBERRIES.—Strawberries layered for potting will probably require water twice daily during hot weather. As soon as the runners are rooted they can be severed from the parent plant, put in partial shade, and the pots plunged in coal ashes or leaf soil to keep the soil moist.

FIGS.—Fig trees are making rapid growth, and should have their main branches secured to the wall or fence. When the leading shoots have made sufficient growth, stop them, as this will hasten the ripening of the fruits, and assist the growths at the base of the tree to develop. See that trees growing in dry situations are not suffering from lack of moisture. Dishud the trees again if they are making too many growths. Pinch out the points of extra vigorous shoots to throw more sap into the weaker ones. It is a good plan to place the fruits in muslin bags when they are ripening, and if the bags are tied fairly lightly about the stalks, they will exclude insects. Give the roots a soaking from the sewage tank when the fruits are swelling, or, failing this, a dressing of Clay's fertiliser.

APRICOTS.—The fruits on Apricot trees are swelling rapidly. Shorten the laterals that are growing outwards, and nail in the shoots needed for extension, and also a few promising shoots in the centre of the tree. Keep a sharp watch for such insects as earwigs and woodlice. See that the roots are well supplied with water, and if necessary apply another mulching; this will keep the ground from cracking. Continue to use the syringe until the fruits begin to show colour. The variety Frogmore Early will soon show signs of ripening. These fruits are splendid for boiling and preserving, and advantage should be taken to use all surplus fruits in this way. The fruits should be gathered as soon as ripe, laid on tissue paper over wool wool, and placed in a cool fruit-room.

PEACHES AND NECTARINES.—Keep the roots of Peaches and Nectarines well supplied with water, and syringe the trees freely, using water in which a bag of soot has been immersed.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

VANDA.—As plants of *Vanda teres* pass out of flower they should receive attention at the roots. Specimens that have lost a number of their bottom leaves may be severed at a desired length below some of the aerial roots, and the upper portion potted singly, or three or more stems may be placed together in pots of a suitable size or in narrow boxes or troughs. The receptacle should be provided with ample clean crocks for drainage. Use a compost consisting of equal parts *Osmunda*-fibre and *Sphagnum*-moss with a sufficient quantity of crushed crocks and small lumps of charcoal added to render the mixture porous. Plants that do not require this treatment should have all the old soil washed from the roots and fresh compost substituted. Secure each plant firmly to a neat Teak wood stake. When the potting is finished, water the roots copiously and place the plants in a house with a southern aspect, keeping the atmosphere humid and shading from bright sun for a few days. Later the plants may be exposed fully to the sunlight and syringed overhead frequently. This treatment should be continued throughout the growing season, but when growth is completed, water should be withheld gradually from the roots and the plants allowed a period of rest for at least four months. No direct watering of the roots should be done when the plants are resting, but they should be syringed occasionally to prevent the leaves and stems from shrivelling. The lower parts of the stems from which the tops have been removed may be left in the receptacles, and, if grown in moist conditions, will soon form new top growths and roots, when they should be re-potted. The stock may be increased by placing portions of the stem in *Sphagnum*-moss; when they have formed new growths and roots they may be potted and grown in the usual way.

FRUITS UNDER GLASS.

By JAS. HENSON, Head Gardener at Ginnerysbury House, Aston, W.

MELONS IN FRAMES.—The weather during most of June was favourable to Melons in frames, and plants that have been well looked after should now be showing signs of fruit. See to it that two flowers at least are fertilised at just about the same time, and, if possible, on strong plants, two additional ones. The fruits may not grow to such abnormal size as those in pits or houses, but the flavour should be equal, if not better. Two medium-sized fruits are more economical than one large one. A piece of a broken roofing tile is very suitable for placing under the fruits in frames. Do not use Strawberry pans or saucers, as, being concave in shape, they hold water. Keep the growths frequently pinched as soon as the fruits are set, but never remove a very large amount of foliage at one time. Damp the foliage freely at the time of closing the house in sunny weather. See to it that sufficient tepid water is given at the roots, early in the day, before the sun is hot. Canteloupe Melons need not be grown in quite so much warmth as ordinary Melons; in fact, a little air at night in hot weather will be beneficial when the fruit is swelling.

MELONS IN PITS AND HOUSES. A slight amount of warmth in the pipes will be advisable. Cutting a notch in the growth is a very good way to check splitting at the base of the fruit. From the time of planting onwards take every opportunity, by closing the house early, to hasten growth. Little warmth will be needed beyond what is sufficient to keep down superfluous moisture. See that the roots are never dry. If a few plants are available, and pots of fairly good size or inverted Seakale pots are to hand, some very good fruits can be secured in the autumn by growing these late plants in full sunlight near the roof-glass.

GATHERING PEACHES AND NECTARINES.—Peaches and Nectarines to be packed for transit should be gathered whilst the flesh is fairly firm,

and this is the more necessary in the case of Peaches. Ripe Nectarines keep somewhat longer than Peaches in the same condition. Again, the Peach sometimes has a tendency to become woolly in the flesh if it remains on the tree for too long, more especially in the case of late varieties such as Sea Eagle. Peaches that have this tendency should be gathered early; it rarely, if ever, occurs with Nectarines. In gathering these stone fruits, sufficient care is not always taken to prevent bruising. The old-fashioned plan of gently twisting the fruit in the palm of the hand answers in some cases, but not in all. Take as an example Early Rivers' Nectarine; the fruits of this variety swell up tight to the stem, and to gather them requires more than ordinary care. The best method is to use a stout pair of Grass scissors to sever the stalks, and that without any semblance of a twist. This method must also be adopted with some varieties of Peaches, the newer Peregrine for example. The early Peaches, Duchess of Cornwall and Duke of York, have, on the contrary, a tendency to drop readily when ripe. In their case the fruits should be enclosed in small nets. Morning gathering is preferable, as the fruits are then firmest, and the packing should also be done in the morning. For dessert, the fruits should be gathered early in the day, when they are cool, and kept in a cool place.

THE FLOWER GARDEN.

By W. J. GIBSE, Gardener to Mrs. DEMESTER, Keele, Hall, Staffs.

FLOWERING SHRUBS.—Directly flowering shrubs pass out of bloom they should be pruned. Remove weak growths and cut back the old flower branches to a strong shoot. The young shoots must be fully exposed to sun and air, to ripen the new wood. Shrubs that require attention at the present time are *Deutzia*, *Wigwaga*, *Ribes*, *Philadelphus*, *Kerria*, *For-sythia suspensa*, and *Chimonanthus fragrans*. The young growths of flowering shrubs on walls and pergolas should be tied after the weak and straggled wood has been removed. Copious supplies of clear water and liquid manure and mulchings of some moisture-retaining material will assist the young growths considerably.

AZALEAS. The seed vessels should be poked off as the plants pass out of flower, but care must be taken not to destroy the embryo flower buds. It may be necessary to reduce or cut out some of the most vigorous shoots if a symmetrical shape is desired. To encourage the young growths, take the surface soil lightly, apply liberal mulchings of decayed manure, and water copiously to wash the mineral properties to the roots. During a dry period Azaleas soon show the beneficial effects of this treatment.

RESERVE BORDERS. Any surplus bedding plants may be utilised to fill spare beds in the reserve garden. These beds or borders may be planted with suitable varieties to provide cut flowers for decorative purposes. Scabious, Aster, Larkspur, Zinnia, Verbena, and similar plants may be used. The thinnings of annuals are excellent for the same purpose, but they should be set out during showery weather. The plants that were used for spring bedding should be divided and replanted without delay. *Dianthus*, *Polyanthus*, *Aubretia* and *Arabis*, planted in rows 9 inches apart, will make suitable plants for next spring's display. The flat hoe must be used continually between all reserve plants, and during dry weather they should be watered.

ANCHUSA ITALICA.—In staking the plants, take care that the ties do not cut the branches. The shoots should be hooped up with some soft material to a strong central stake. Seed grown now will provide good flowering plants next year, or the stock may be increased at a later period by root propagation.

WALLFLOWERS. The flat hoe should be often used between the young plants of Wallflowers. There is still time to sow seed if not previously done. Bulbs will be very scarce in the coming autumn, therefore it is advisable to increase the stock of spring bedding plants.

PLANTS UNDER GLASS.

By J. G. WESLEY, Gardener to Lady NORTHCOLE, Eastwell Park, Kent.

WINTER-FLOWERING BEGONIAS.—Begonias are almost indispensable in any garden where decorative schemes are carried out during the winter months. That most popular variety, *B. Gloire de Lorraine*, can be kept in flower for more than six months in the year if successive batches of plants are grown. The earlier struck cuttings should be potted in small pots, and another good batch of cuttings inserted. After this time of the year this section of Begonia always appears to grow faster. The cuttings strike readily in a light, sandy compost, which should also be used (but with less sand) for re-potting. Grow the plants in a light, warm house, and shade them from bright sun, but do not use permanent shading. Keep the house and plants syringed regularly to ensure a damp atmosphere. Fumigate at frequent intervals to keep down thrips. There are several varieties of the Lorraine type of Begonia, the best being *Gloire de Cincinnati*, *Mrs. Leopold Rothschild*, and *Mrs. Bedford*. The white variety, *Thurford Hall*, is a good companion to these named.

ALYSSIA CITHIODORA.—The Lemon-scented *Verbena* is a favourite in most gardens, and at least a few plants should be grown in pots for use in the conservatory or cool greenhouse. Grown as a standard, it is useful for grouping with other plants, and half-standards and bushes are seldom out of place. Established plants require plenty of water, and should never be allowed to become dry at the roots, or the foliage will quickly assume a yellow, starved appearance. To keep the plants in good condition, the joints of the shoots should be pinched regularly. Syringe the plants to keep down red spider.

THE APIARY.

By CINCINNUS

SWARMS. As bee-keeping is being taken up by many who have not previously kept bees, it may not be out of place to describe how to start bee-keeping from the issue of the swarm. After the swarm issues from the parent hive the air is filled with apparently wild bees, which seem to float about in clouds. Within a few minutes they begin to settle in a bunch on a bush or tree. Sometimes the whole swarm descends for no apparent reason. To prevent this, take the garden syringe, and after putting on the fine rose, spray the bees in the air. Thinking it is a shower of rain, they will soon begin to settle. Do not interfere with the cluster until quietness reigns. The bees will cluster more tightly if they be sprinkled with cold water. Under the swarm put a sheet or sack with a large stone on it. Take the skep and place it directly under the swarm, mouth upward, as close as possible round the great mass of bees. Hold the receptacle tightly, and give the bunch on which the bees are clustered a few very sharp shakes to dislodge the bunch. Overturn the skep carefully on the sheet below, placing the stone underneath the edge to admit the bees freely, and shade with leafy branches or an umbrella to keep them cool, and so prevent desertion. After 6 p.m. remove the swarm to a previously prepared position, having fitted up the frames with starters about an inch and a half deep, and if the season be good, put on sections or shallow frames fitted with full sheets of foundation in which to store surplus honey, always separating the brood chamber from the supers by using queen-excluder zinc. Should the weather be unfavourable, feed the bees on syrup, slowly giving sufficient for daily needs until better weather prevails. Use plenty of quilts in the hive and leave the entrance widely open. Should a swarm desert, remember the bees are yours as long as you keep them in view, so that you can follow them wherever they go. Sometimes bees do not settle in such convenient places as one would like. Occasionally, they settle in a thick hedge, in which case it would be necessary to place the hive above them, and induce them to rise by gently using the smoker.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher:—Our correspondents would obviate delay in obtaining answers to their communications and save us much trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused manuscripts or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matter which it is desirable to bring under the notice of horticulturists.

Letters for publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, JULY 11
Wellington Royal Horticultural Society: Flower Show.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last 60 years at Greenwich, 62.6.

ACTUAL TEMPERATURE:
Gardener's Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, July 5, 10 a.m.: Bar, 30.2; temp, 58; Weather, Dull.

SALES FOR THE ENSUING WEEK.

FEDERAL
The collection of orchids formed by A. Bonfield, Esq., by Protheroe & Morris, at 67 and 69, Chespond, London, E.C., at 1 o'clock.

The Garden of England in War Time.

In few places has the war wrought greater changes in agricultural practice than in Kent, and certainly no county has shown greater resource in modifying its agricultural methods.

Not long after the outbreak of war it became evident that the Hop-growing industry must be curtailed. Even in peace times that industry, though rich in prizes, was also rich in surprises, and, with the added uncertainty of war and the prospect of less beer, to continue to devote the whole acreage to the cultivation of this crop appeared to Kent Hop-growers to be not only unpatriotic but unbusinesslike. In spite, therefore, of the fact that the established Hop gardens, with their attendant oast houses, represent a large amount of capital, many hundreds of acres of Hops were grubbed up and the oast houses turned into Potato and other stores, or left to lie idle.

It is interesting to observe that the place of Hops is being taken in large measure by market garden crops; among these the Potato comes first, and in the excellent soil of the Hop gardens, well cultivated and

manured and weedless, the crops are doing extremely well. Potatoes, Carrots, Parsnips and Brassicas have been planted on a large scale. The fields under these crops are often of considerable extent, and one may see seventeen acres of Carrots, and even larger breadths of Parsnips, both of which crops are, generally speaking, remarkably promising.

Labour difficulties are responsible for somewhat late planting of some of the Potato crops, but the weather this year has been kindly, and lateness of planting is not likely to turn out a disadvantage. The only crop, indeed, which appeared to be suffering from late planting was the Onion. Judging from the admirable examples of crops growing on the rich brick earth in the neighbourhood of Faversham, it may be predicted that the war will leave a permanent impress upon the cultivation of Kent, and that market garden crops have come to stay.

Nowhere is the response to the changed conditions brought about by the war more remarkable than in the gardens and on the farms of Messrs. Mount and Sons, of Canterbury. The Roses for which this firm is famous have been in large measure replaced by market garden crops, only enough Roses having been kept to maintain the stock of varieties. Both out-of-doors and in the houses previously devoted to Roses market garden crops have been planted, and the Tomatos under glass would be a credit to a grower who had specialised in that crop and nothing else. Plants of Kondine Red and Ailsa Craig varieties are bearing large trusses almost to the ground level, whilst in trial grounds Potatoes and other crops already mentioned demonstrates that men who have learnt how to grow Roses and Carnations to perfection can turn their knowledge swiftly to good account in the cultivation of any other crop.

In one direction, at all events, fortune appears to be favouring the Kent growers, for Cherry and Apple crops, if we may judge from those on Mr. W. W. Berry's farms at Selling and on Messrs. Mount's at Canterbury, are very heavy indeed.

The Cherry orchards at Selling, consisting of large trees, are covered with rapidly ripening fruit, and present a wonderful sight. The fruitfulness of these trees may be judged from the fact that certain of the largest are bearing, according to expert estimate, not less than 12 cwt. of Cherries, whilst many of the lesser trees have crops of between 4 and 5 cwt. Early Rivers, Black Circassian, and Governor Wood, are among the numerous varieties of Cherries which are producing fine crops. The Cherry orchards are under grass, but the grass is kept cropped close by sheep, the ideal aimed at and achieved being that the grass shall not wet the visitors' boots. It is to this cropping by sheep that Mr. Berry attributes the absence of damage to the Cherry trees by caterpillars, and for confirmation he pointed to contiguous Cherry orchards, in one of which the grass is close cropped by sheep, and the trees undamaged and fruitful; in the other the grass is long,

and the trees showing in damaged leaf and shortness of crop the effects of the ravages of the caterpillars.

In the Plum orchards of Messrs. Mount, where also heavy crops are borne, pigs are used with good effect as ground cultivators. The pigs, kept on half-rations of sharps and bran, have their naturally voracious appetites so whetted that no weed except the dock is left after they have loosed the ground with their snouts.

In spite of labour difficulties, the excellent practices of normal times are being maintained; the fruit trees are banded with Tanglefoot and have been sprayed as usual, and to these measures are to be attributed the excellent Apple and Plum crops which should in some measure compensate for the sacrifice of the Hop yards.

Anyone who doubts the value of banding with Tanglefoot and spraying should pay a visit to Messrs. Mount's Plum orchards and note that here and there among the branches heavily laden are some which have been missed by the sprayer and are barren of fruit. Indeed, those who find a luxury in encouraging that self-depreciation which has become a national habit would do well to make a tour to the Garden of England and learn of the resourcefulness with which the men of Kent are meeting the changed and difficult circumstances of the present time. The high standard of cultivation is to be attributed no doubt to the energy and capability of the growers as well as to a naturally fertile soil; but in part also to the admirable work in education which has been carried on for many years by the South-Eastern College at Wye. It is indeed a pleasure to hear from some of the growers themselves the ready admission of the very beneficial influence which the College has exercised on cultivation in the county. It encourages the hope that colleges of this pattern may be established in other of the fruit-growing districts of the country.

PRESENTATION TO MR. S. ARNOTT.—The members of the Maxwelltown Allotment Holders' Association, at the formal opening, on June 30, of the five fields of allotments in the hugh provided through the Town Council, presented Provost S. ARNOTT with a silver key. The presentation was made by Mr. R. WIGELMAN, the chairman of the association, who stated that the local plot-holders were indebted to Provost ARNOTT, not only for starting the scheme, but for much useful work in connection with it.

THE POTATO CROPS OF ENGLAND AND GERMANY.—In an interesting article contrasting British and German agricultural methods, Mr. A. E. V. RICHARDSON draws attention to the fact that, whereas between 1888 and 1915 the Potato yield of Great Britain increased 20 per cent., that of Germany increased 109 per cent.

PRICES FOR EARLY POTATOS IN AYRSHIRE.—Very high prices were realised at the first auction sales of growing crops of Early Potatoes on the Carrick coast of Ayrshire on the 26th ult. The highest price obtained was for 2 acres 3 rods at James-town, which realised £165 per acre. The highest price at Warren was £127 per acre for upwards of five acres, and at James-town £125 per acre was paid for about six acres. The average prices per acre were as follows:

The *Journal of Agric.*, Victoria, Australia, April, 1917, p. 98.

follows:—James (600), £ 7 7s.; White (£117 14s. 7d.; Marston, £9 12s. 4d.). The lowest price was £7 per acre, and £4 for three lots at Marston.

ESTIMATE OF DAMAGE BY RODENTS AND BIRDS. Various estimates have been made at different times as to the loss to the nation caused by farm pests, including the rat, the mouse, the house sparrow, and the wood-pigeon. One of the latest estimates has placed the amount of damage at £40,000,000 annually, or about £1 per head of the population. This sum includes a loss of £15,000,000 due to the brown rat, and £8,000,000 to that of the house sparrow. These calculations, of course, may be on the extravagant side, but that an enormous amount of food value is lost to the country through these pests is beyond dispute, and it is especially so here at the present time.

RULHÉBEN HORTICULTURAL SOCIETY.—The secretary of the Royal Horticultural Society has received the following interesting communication from the secretary of the Rulhében Horticultural Society:—"You will be interested to know that we had our first flower show last month, when we staged some 200 pots of spring flowers, which had been grown in frames in the market. The exhibition was in every way successful, and was much appreciated by our fellow prisoners. We had photographs taken of the two tables, and have ordered copies for you, which I hope to send off very soon. We have also a book of photographs of some of our barracks gardens as they were during the summer of 1915, this has been bound in leather by our own bookbinding department, ready to send off, but we are at the present unable to do so owing to regulations regarding mounted photographs being a short time ago by the military authorities. We are sending a similar book to the Crown Princess of Sweden, and you would suggest that you communicate with her Royal Highness at a later date. From this book of photographs you will be able to form a very good idea of the interest which has already been taken in the camp in horticultural work. At a committee meeting held recently, it was resolved to hold a competition for the best barracks garden of plants raised from seed in the camp in conjunction with a summer flower show and competition of various classes, and also an exhibition of vegetables grown in our vegetable garden. We should like very much to award a certificate for the various classes, and I have been instructed to inquire if you have any cuttings for allied societies, and if you could let us have the required number. As soon as the schedule has been drawn out, I will communicate further with you on this subject."—S. Good, F. Hower, Hon. Sec., Rulhében Horticultural Society."

IMPROVED WAGES AT KEW.—Journymen and women gardeners employed in the Royal Gardens, Kew, are now paid 7s. and 5s. per week and 9d. per hour for all overtime and Sunday duty.

"KEW BULLETIN."—In reply to a question by Sir WILLIAM BRIDE in the House of Commons, Mr. STANLEY BODWIN stated that the Select Committee on Publications and Debates' Reports recommend that the *Kew Bulletin* should be continued, but with due regard to economy. The *Bulletin* will probably be curtailed by withholding certain classes of information, the publication of which it is considered can be postponed without detriment to the welfare of the State."

PUBLICATIONS RECEIVED.—*Report of the Tulip Nomenclature Committee of the Royal Horticultural Society, 1914-15.* (London, Spottiswoode, Ballantyne & Co. Ltd.) Price 2s. 6d.—*Standard Cyclopedia of Horticulture.* By I. H. Bailey. Vol. V.—S to Z, and supplement Price 25s. (New York: The Macmillan Co.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

IRREGULAR GERMINATION OF SEEDS.—On p. 204, 1st 1914, a single plant of *Perithrium arvense* Golden Feather produced seed here. The seed was sown under glass in February, 1915, and the first seedlings that appeared were lost; but a second batch came up afterwards, and a third later still. All the seed was from the one plant. Many times have I said, when sowing seeds that were purchased germinat-

ing, berries are attractive in winter. *Prunella Jones, Delaware Co. Warblers.*

"SCIENCE AND THE NATION."—The article on p. 259, over the signature initials J. R. P., reviewing the recent volume bearing this title, was inspiring, commendable as well as scientific. Horticulturists must think seriously about the future. J. R. P. says: "We are at the parting of the ways. If we do not now learn and profit by the lesson which it has needed a great war to teach us, the writing on the wall will be written for us, as it has already been written for many another great

FIG. 2. BRANCH OF CALLITRICHE OREGONICA, WITH CONES. (See p. 10.)

ing after another, that such seed was old, and would take a thousand or so years to plant. If Golden Feather were in the open, and they came up in two distinct batches, do the outer flowers of the head produce ripen seed than the centre flowers, or do the first flowers ripen seed better than the later ones?—*W. B. A. A. A.*

A WASP PLANT.—*Pezomachus* has a peculiar fascination for open spaces, and I have lately captured many swarms of the insect in a bed of these plants. The tree is very attractive in its glossy foliage, which assumes brilliant autumnal tints, whilst the black

action before us. Pure science is the stream of knowledge which fertilises practice. Pure science cannot be expressed in terms of pounds sterling and the ordinary Englishman likes to act on the principle of putting down six pence on Monday and picking up a shilling on Tuesday. Thanks, J. R. P. I thought it was only Salsman who did this! But I think we are all now taking longer views. The question, like most others, turns on £ s. d. Professor Pope, writing on "The National Importance of Chemistry," says: "In the future money will have to be provided from public fund-

(Photograph by E. J. Wallis)

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee

for the stimulation and prosecution of chemical research, whether of purely academic or practical technological interest, and in amounts which bear no comparison with the few thousands of pounds per annum which have been available in the past. . . . If recent events have not demonstrated that the national will being requires the devotion of vast sums to the prosecution of scientific research no printed words will make the truth more evident. . . . I am glad the volume contains two articles by writers well known in the horticultural world. Dr. Keeble writes most lucidly on "The Science of Botany and the Art of Intensive Cultivation." Only two sentences I quote: "Cultivate the laboratory a little less and our gardens rather more. Discourage the modern sessile habit assumed by students, and see to it that the men who are to replace us have wide as well as deep experience." The other writer will be known to horticulturists as Professor Biffen. His subject is "Systematised Plant Breeding," and one rises from a perusal of his article with the feeling not of how much has been discovered, but how much there is still to know, which is the best plea of all for enlarged resources being available for research work. The writer on "Science in Forestry," Mr. W. Dawson, concludes by saying: "Forestry is a composite subject applying the principles of many sciences, and the only hope for its advancement lies in the close partnership of the laboratory investigator and the practical forester." Change "Forestry" to "Horticulture," and the sentence accurately expresses, I believe, the sentiments of all the best minds in horticulture to-day. W. Cuthbertson, *Duddingston, Edinburgh.*

REPAIR OF FLOWER POTS.—It may be of use to note that I experimented on two seed pans (one 12 inch) which were broken into three pieces each, and which have stood two seasons since repair. They were well soaked in clean water and a thick cream or thin putty of Portland cement spread on the cut surfaces; after tying with string to keep in place a fillet of thicker cement was laid along the crack. The pots were then slowly dried under old sacking. D.

TREATMENT OF EVERGREENS DAMAGED BY FROST.—It often happens that when half-hardy, or even hardy, evergreens have been badly caught by frost, they can be saved by cutting down the stems with the withered, frosted leaves, since new shoots may then spring up again from the stool. Possibly the principal damage done, apparently by the frost, is really due to the unchecked depletion of the water reserves in the wood, consequent on the evaporation from the withered leaves after the frost has actually passed. There are, it is true, some objections to this hypothesis, and they are based on newer observations tending to indicate that the stomata are less efficient in regulating transpiration than has been generally believed. But however this may be, I had, unfortunately, several opportunities of testing the effects of removing the damaged leaves from shrubs injured by the frost during the earlier part of this year. Thus, *Berthamnia fragifera* had every leaf killed, and I cleared them all off two main branches springing from close to the ground level, whilst leaving the rest of the specimen (about 12 feet high) untouched. For some time the effects were not striking, but now, at the end of June, the axillary shoots have pushed vigorously on the two treated branches, whilst the whole of the rest of the plant seems in a very purling state. It appears, from this and other observations, that it might be worth while to experiment further in the same direction, especially in the case of rare or valued shrubs. The labour of stripping the leaves is very small, but it must be done immediately the frost damage indicated by wilting of the leaves becomes apparent. Of course, too much must not be expected, for if the soft tissues outside the wood are killed, probably nothing could save the plant. Nevertheless, it is not unlikely that a good many trees which might have been saved are really killed by the after-act of its severe frost. Everyone who knows how fatal a sunburn following on a hard frost is apt to be over-zealous in plants, whereas the deciduous trees, and shrubs often come through it untouched. J. B. F.

JUNE 19. *Present:* Mr. E. A. Bowles, M.A. (in the chair), Sir John Llewellyn, Col. H. E. Rawson, Messrs. J. Fraser, A. D. Cotton, W. Hales, J. T. Bennett-Poe, W. J. Bean, F. J. Clattenfield (hon. secretary), and R. Farmer (visor).

Pine Rust. Mr. A. D. Cotton showed specimens of Pine blister rust on *Pinus Strobus* from Haslemere. This disease is due to the fungus *Cromatium Rubicola*, and has its alternate stage on Black Currant or some other species of Ribes, occurring at times on the Red Currant, and rarely, in this country, on the Gooseberry. It has occurred on the Gooseberry at Oxford.

Potato Spraying. Some discussion took place with regard to the relative values of Bordeaux and Burgundy Mixtures for spraying Potatoes. In the former quick-line is required, in the latter washing soda; usually washing soda is of more constant composition than quick lime, and the spray is therefore easier to make. In both cases the more dilute the two materials to be mixed before the mixture is made the better, and in both cases also the mixture should be done immediately before the spray is used. The experimental spraying in Ireland during the past few years, as well as other experiments, shows that the 1 per cent. Burgundy Mixture is an excellent and safe preventative of the disease caused by *Phytophthora infestans* beetle. The proportions of the materials used are 4 lb. copper sulphate, 5 lb. washing-soda, and 40 gallons of water.

Various Plants. Mr. Bowles showed, on behalf of Mr. Elwes, *Orchis foliosa*, a fine-flowered form of *O. latifolia*, *O. uncinata*, *Arisaema consida* (from Himalaya and the Tibet border), a smaller plant of a species of *Arisaema*, *Polygonatum* with a fallacious inflorescence which is constantly produced, and *Roscoea* (Caulion) lutea, a hardy plant from the Himalaya belonging to the Scitamineae. He also showed from Miss Willmott's garden at Warley the uncommon Iris *Syrdenensis* from Asia Minor; from his own at Calesham Meconopsis latifolia, the semi double form; blue and white forms of *Campylopus patula*, and a form with six petals; a pale blue form of *Ranunculus*, and the uncommon *Centranthus angustifolius*, which he had collected at Lauteret.

Hybrid Mints. Mr. Fraser showed a hybrid of *Mentha rotundifolia* × *viridis* which had been collected near Swanage; it was nearer to *rotundifolia* than to its other parent.

Uall: Effect on Onions. Mr. Fraser also drew attention to the effect of hail upon Onions, the leaves of which show white bruises caused by recent hailstorms.

Xyleborus dispar in *Sycamore.* Mr. Cheal sent specimens of the common *Sycamore*, *Acer pseudoplatanus*, from the Crawley district, bored by the shot-hole borer, *Xyleborus dispar*, and containing the larvae of the beetle in great numbers. This pest also attacks fruit trees, including Plums, Pears, and Apples, and is a difficult one to deal with, the complete destruction of infested trees being probably the best course to pursue.

Effect of Salt Water. Dr. Voelcker sent a note upon a case of scorching of Peaches and vines where, the supply from a well having given out, water from a lake had been used; the analysis of the lake water showed no less than 162 grains of salts to the gallon, magnesium being present also, and suggested the dilution of sea water. The well water contained only 5 grains of salts to the gallon.

Populus lasiocarpa. Mr. J. C. Allgrove showed a fruiting specimen of this fine tree from Langley.

JULY 5. The usual fortnightly meeting of this Society was held at the London Scottish Drill Hall, Westminster, on Tuesday last.

The National Sweet Pea Society arranged, in conjunction with the exhibition, a special show of Sweet Peas grown by its members, but the response was only moderate.

The Floral Committee inspected several novelties, but the only awards were made to three new Roses. Several excellent groups were staged.

Messrs. R. WALLACE AND CO., Colchester, arranged an imposing collection of many excellent Ferns, including several promising seedlings: Delphiniums, Japanese Irises and *Primula Litolomiana*. A fine corner group of miscellaneous border flowers was arranged by Messrs. BAKER, LTD., Wolverhampton, in which magnificent Delphiniums, Erigerons, and Primulas were conspicuous. Mr. J. C. ALLGROVE, Langley, showed the recently certificated *Spiraea Veitchii*; *Fremontii*, Delphiniums, and the dwarf deep pink *Acantholimon venustum*. Such Delphiniums as *Statuaria Rude*, *The Alake*, and *Rev. Lascelles*, were included in a fine group of these flowers staged by Messrs. G. BUSBY AND CO., Maidstone.

Several good collections of border flowers were arranged on tables, the exhibits from Messrs. J. PIER AND SONS, Bayswater, Mr. G. W. MILLER, Wisbech, and Mr. G. REUTHE, Keston, being meritorious. An interesting collection of Liliiums was arranged by the ALDER RIVER NURSERY CO., Ivor Heath, Buckinghamshire. Special prominence was given to plants of *L. Willmottiae*, which received a Card of Cultural Commendation.

Roses again formed a prominent feature of the exhibition. From Messrs. B. R. CANT AND SONS, Messrs. WM. PAUL AND SON, Messrs. F. CANT AND CO., and Mr. E. J. HICKS. Of the numerous varieties *Annie Penrice*, a brilliant pink garden Rose of good size, shown by Messrs. F. CANT AND CO., and *Prima Donna*, a smaller and more compact bloom, heavily flushed with deep red, shown by Messrs. WM. PAUL AND SON, are deserving of mention. The variety *H. V. Machin* was well shown by nearly all the exhibitors.

Among other new Roses in Messrs. B. R. CANT AND SON'S group, was the variety *Emily Gray*, which was awarded the Gold Medal of the National Rose Society in 1916. It was a yellow Wichuraiana hybrid, with glossy, mildew-proof foliage.

Stove plants were shown by Mr. L. R. RYSELL, Richmond. The group contained *Caladiums*, *Marantas*, foliage *Begonias*, and *Medinilla magnifica*. An excellent strain of *Gloxinia* was shown by Messrs. R. AND G. CUTBERT, Southgate. Messrs. H. R. MAY AND SONS, Edmonton, brought their customary collection of Ferns, in which were arranged *Lantanas*, *Verbenas*, and other flowering plants.

The Orchid Committee gave an Award of Merit to a new *Odontoglossum*, and awarded two Medals to Collections.

Floral Committee.

Present. Messrs. H. B. May (chairman), A. Turner, John Heal, C. Dixon, J. Green, G. Reuthe, G. Paul, W. J. Bean, Chas. E. Shea, F. Page Roberts, W. P. Thomson, J. F. McLeod, W. H. Page, J. W. Moorman, E. H. Jenkins, James Hudson, John Dickson, W. Howe, W. Blakey, C. R. Fielder, W. Cuthbertson, A. G. Jackson, H. J. Jones, S. Morris, R. C. Notcutt, E. A. Bowles, and Chas. E. Pearson.

AWARDS OF MERIT.

Rose Miss May Marriott. A delightful Rose which originated as a sport from the popular *Madame Edouard Herriot*. In shape, size, and style of growth it is like its parent, but the colour is rich, bright golden apricot, with a little orange shading on the outside of the petals. Shown by Mr. THOS. ROBINSON, Nottingham.

Rose Vermoid. A large, single-flowered, climbing Wichuraiana variety with ample, highly-polished leaves. The blooms are light yellow, shading to golden yellow at the base of the petals; the ring of stamens and anthers is also golden yellow.

Rose Walter C. Clark. A beautiful new Hybrid Tea Rose of medium size (as shown) and exceptional fragrance. The colour is deep velvety crimson, and in the bud stage and just as the blooms begin to expand the appearance is very fine, but the fully opened flower often shows the centre. Both these varieties were shown by Messrs. WM. PAUL AND SONS, Waltham Cross.

GROUPS.

The following Medals were awarded for cool lectures:—

Silver-gilt Banksian Medal, to Messrs R. WALLACE and Co., Messrs. J. PIPER and SON, Messrs. BAKER, LTD., Messrs. BLACKMORE and LANGDON, and Mr. W. H. HOLLOWAY.

Silver Flora Medal to Messrs. B. R. CANT and SONS, Messrs. R. and G. CUTBERT, Messrs. H. B. MAY and SONS, and Mr. L. R. RUSSELL.

Silver Banksian Medal to Messrs. F. CANT and Co., Mr. E. J. HICKS, Mr. G. W. MILLER and Messrs. WM. PAUL and SON.

Bronze Flora Medal to Mr. J. C. ALLGROVE, Messrs. ALLWOOD BROS., Messrs. J. CHEAL and SONS, Messrs. G. BUNYARD and Co., and Mr. J. STEVENSON.

Bronze Banksian Medal to the ALDER RIVER NURSERY Co., Messrs. H. CANNELL and SONS, Mr. J. DOUGLAS, and the Rev. J. H. PEMBERTON.

SWEET PEAS.

Mr. W. H. HOLLOWAY, Port Hill, Shrewsbury, staged charming bunches of clear blooms, his exhibit being the best in the Hall. The principal varieties were Hope, a rich crimineo-rose-coloured flower; Adelaide (syn. Anzac); Warrior, which contrasted well with Felton's Cream; the soft pink Beryl; Melba, Golden Glory, Dobbie's Orange, President, and Mrs. C. P. Tomlin. R.H.S. *Silver-gilt Banksian Medal* and National Sweet Pea Society's *Gold Medal*.

Mr. J. STEVENSON, Wimborne, exhibited a collection, but the many unopened flowers reduced the colour value of the large stands of bloom. Royalty, a purple variety, was conspicuous, whilst others of merit were King Maize, Peace (pink), Faith (light lavender blue), and Charity (deep red). R.H.S. *Bronze Flora Medal* and National Sweet Pea Society's *Silver Medal*.

Messrs. PIPERS, Bayswater, had a good exhibit of bright flowers set up in dainty and artistic baskets and vases. Freda (pale blue), Mr. Gentle (deep apple-blossom), Max Unwin (scarlet), Margaret Fife (blue), Sincerity (crimson), and R. F. Felton were a few of the finer varieties. *Silver-gilt Medal* of the National Sweet Pea Society.

Small exhibits were shown by Mr. R. F. BARKER, Muswell Hill; Mrs. FARNHAM, The Heights, Wisley; Mr. C. COLVIN, Edelehan; Mr. ROBT. BOLTON, Birkbrook, Essex; and Messrs. A. DICKSON and SONS, Belfast, who showed a fine bluish variety in Elegance.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), J. Wilson Potter, Stuart Low, Frederick J. Hanbury, Pantia Ball, T. Armstrong, A. McBean, Arthur Day, C. H. Curtis, Walter Cobb, W. H. White, Fred K. Sander, R. Brooman White, J. Charlesworth, R. A. Rolfe and C. J. Lucas.

AWARD OF MERIT

Odontoglossum Queen Beaudant ("Memoria Lionel Crawshaw" (Harrington × transplants Lionel Crawshaw), from Dr. BARRI CRAWSHAY, Esq., Rosefield, Sevenoaks (2r Mr. Stubbs). A noble *Odontoglossum* and the best of a fine strain for which Mr. Crawshaw has already secured one First class Certificate and two Awards of Merit. The new variety is the largest and best in every respect. The broad sepals and petals are blotched and tinged with dark red brown, the yellow ground-colour showing through at the margins. The almost circular lip is white in front, the base light violet, and the crest yellow.

PRELIMINARY COMMENDATION

Odontoda Memoria Lionel Crawshaw (*Odin Ceruus* × *Odin Charlesworthii*), from Dr. BARRI CRAWSHAY, Esq. A distinct new hybrid, flowering for the first time, the single large bloom being of fine substance. The colour is light brownish orange, changing to cream colour towards the margin of the lip, which has a well defined yellow crest.

GROUPS.

Messrs. ARMSTRONG and BROWN, Orchidhurst, Tunbridge Wells, were awarded a Silver-gilt Flora Medal for a group rich in hybrid Miltonias, *Odontoglossums*, and brilliantly coloured *Odontodas*. Among the Miltonias the handsome M. J. Gurney Fowler, for which a First class Certificate was given on May 19, 1914, showed prominently, its large rose-pink flowers, with deep maroon mask on the lip, being very effective.

Messrs. CHARLESWORTH and Co., Haywards Heath, were awarded a Silver Flora Medal for a group of excellent specimen Orchids, each bearing many flowers. *Cattleya Warscewiczii* Mrs. E. Ashworth had six large bluish white flowers; we also noticed a fine white petaloid, and a very large dark form of *Cattleya Gaskelliana*, each with nine flowers.

Messrs. SANDERS, St. Albans, staged a small group, which included the new *Odontoda Aphrodite* Miltonia Warscewiczii × *Odin Magali Sanderi*, with prettily-marked flowers of good shape, and Miltonia Isabel Sander, white, with dark maroon base to the lip.

Dr. BARRI CRAWSHAY, Esq., showed *Odontoglossum Cleopatra*, *Memoria Lionel Crawshaw* (Carnegie × Vaylsteckel), a large, showy flower the character of which is dominated by *O. Harringtonii*, which was one of the parents of *O. Carnegiei*. The sepals and petals are sepia brown with lighter margins; the large lip is purple at the base and white in front.

H. T. PITT, Esq., Rosslyn, Stamford Hill (2r Mr. Flougeod), showed a fine plant of the remarkable *Ballophyllum Balfourianum*, with large, fleshy cream white flowers, heavily blotched with claret red.

Fruit and Vegetable Committee.

Present: Messrs. J. Chad, vice-chairman, G. P. Berry, E. Bayard, W. H. Divers, Geo. Kell, J. C. Allgrove, E. Beckett, A. Bullock, John Harrison, Owen Thomas, J. W. Bates, Wm. Peart, F. Jordan, and the Rev. W. Walls.

The only exhibit before the Committee was a new Red Currant named Titchcroft Beauty, discovered by Mr. H. Cross, Ovington Kent. The branches were very fruitful, and the berries large and brightly coloured.

TRIALS OF ORIENTAL POPPIES AND TALL BEARDED IRISES

The following Awards have been made by the Royal Horticultural Society to Oriental Poppies and Tall Bearded Irises after trial at Wisley.

ORIENTAL POPPIES

HIGHLY COMMENDED. Beauty of Livorno, sent by Messrs. R. Wallace and Co.; Bobs, sent and raised by Mr. Nottcutt; Boudicca, sent and raised by Messrs. Barr and Sons; Cerise Beauty, sent and raised by Messrs. Barr and Sons; Elsie G. Harkness, sent and raised by Messrs. R. Harkness and Co.; Felix, sent and raised by Mr. R. C. Nottcutt; Hesperia, sent by Messrs. G. Bunyard and Co.; Mrs. J. Harkness, sent by Messrs. R. Harkness and Co.; Mrs. Perry, sent by Messrs. Barr and Sons; raised by Mr. Amos Perry; Orange Globe, sent and raised by Messrs. R. Veitch and Son; Rose Queen, sent by Messrs. R. Wallace and Co.; Royal Scarlet, sent and raised by Messrs. Barr and Sons; Taplow Scarlet, sent and raised by Messrs. Barr and Sons; V. L. Harkness, sent and raised by Messrs. R. Harkness and Co.

COMMENDED. Silverbick, sent by Mr. R. C. Nottcutt.

TALL BEARDED IRISES

AWARDS OF MERIT. *I. Danianus*, sent and raised by Mr. A. J. Bliss, Tavistock; *I. pallida Dubouardii*, from Messrs. Forbes, Ltd., R. Veitch and Sons, and Wisley Gardens; *I. pallida Princess Patricia*, from Messrs. Barr and Sons and G. Bunyard and Co., Ltd.; *I. pallida Rev. H. Wells*, sent by Messrs. G. Bunyard and Co., Ltd.

HIGHLY COMMENDED. Le Réve, sent by Mr. Amos Perry; Mary, from Mr. G. Routh.

COMMENDED. Calypso, sent by Messrs. Barr and Sons and Mr. Amos Perry; Dawn, sent by Messrs. R. Wallace and Co.; Imogenza, sent by Mr. A. Perry and Messrs. J. Forbes, Ltd.; Rosa Lind, sent by Mr. A. J. Bliss.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JUNE 7.—Committee present: The Rev. J. Crombhelme (in the chair), Messrs. D. A. Cowan, J. C. Cowan, Dr. Craven Moore, J. Cypher, A. G. Ellwood, J. Evans, P. Foster, A. R. Handley, A. Hamner, A. Keeling, J. Lupton, D. McLeod, J. McNab, W. Shackleton, H. Thorp, and H. Arthur (secretary).

AWARDS.

FIRST-CLASS CERTIFICATE.

Miltonia Charlesworthii var. *Cynophum*, with flowers 3½ inches across, and *M. Isabel Sander*, with petals flushed with bistrotte and a mask of oriental purple, both from Dr. CRAVEN MOORE.

Cattleya Brinckiana var. *Ashworthiae*, flower white, with lip of brilliant colour, from R. ASHWORTH, Esq.

Cypripedium niveum var. *Dorothy Clare*, from the Rev. J. CROMBHELM.

Cattleya Mossiae var. *Barlow Snowdrop*, a large flower of good shape and colour, from S. GRAVIER, Esq.

Lobelia-Cattleya Domos Superba (*C. Mossiae* × *L. C. Dominiana*), a fine flower with lip of brilliant colour and nearly 3 inches across, from P. SMITH, Esq.

Odontoglossum Phoebe splendens (*viridulum* × *viridum*), from Messrs. J. and A. McBEAN.

AWARDS OF MERIT.

Cattleya Mossiae Madye and *Odontoglossum Prescottii grande*, both from P. SMITH, Esq.

O. Myos (*Harringtonii* × *Lambertianum*) and *Cattleya Mossiae Kitchener*, both from R. ASHWORTH, Esq.

Odontoglossum ciliatum Compueror, from J. J. BOLTON, Esq.

Miltonia Lyoth Cynophum, from Dr. CRAVEN MOORE.

Lobelia-Cattleya Aphrodite Lily Cowan, from S. GRAVIER, Esq.

CULTURAL CERTIFICATE.

To Mr. S. DAVENPORT, for a fine plant of *Cattleya Mendellii*.

GROUPS.

A *Silver-gilt Medal* was awarded to R. ASHWORTH, Esq., Newchurch (2r Mr. DAVENPORT), a *Large Silver Medal* to Messrs. CYPHER and SONS, Cheltenham; and *Silver Medals* to the Rev. J. CROMBHELM, Clayton & Moore (2r Mr. E. Marshall) and Messrs. SANDER and SONS, St. Albans.

HAARLEM GENERAL BULB GROWERS'.

The following Awards have been made by the various Committees of the General Bulb Growers' Society of Haarlem during February, April and May, 1917.

FIRST-CLASS CERTIFICATE.

Tulip Janice Watt.

AWARDS OF MERIT.

Narcissus pector *Olympa Globe* (creamy white, with dark orange-coloured cup); *N. p. Helios* (Single) (sulphur yellow, cup yellow); *Tulip The iris* (Single) (white); *Tulip Duo maximus* (Single) (yellow and white form); *Tulip albino* (Single) (large, white flower); *Tulip Orient* (Single) (copper salmon, striped); *Carnegie rose* and white, the petals on the outside shaded carmine rose); *T. Hesperia* (Single) (brilliant carmine); shaded, single); *T. Dalciana* (Single) (orange red, base yellow); *T. Sans pareille* (Double) (dark violet); *Tis pallida Inca* (standards clear violet, falls velvety violet); *Hyacinth Mr. J. H. Kersten* (Single) (orange red); *Hyacinth Cedra* (Double) (dark blue, shaded purple); *Narcissus Debora* (peri anth broad and round, crown pure yellow).

CERTIFICATE OF THE HAARLEM TRIAL GARDEN. Single *Hyacinth Petrusken* (blue); Single *Early Tulip Platressante*.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

JUNE 11. The monthly meeting of this society was held in the R.H.S. Hall on Monday, June 11, 1917. Mr. Chas. H. Curtis presiding. Two new members were elected. Two members over

the age of seventy years were allowed to withdraw £45 from their deposit accounts, and two members withdrew double amount of interest, amounting to £5 19s. 6d. Notifications of death were received of Privates G. F. Sanders and W. F. Bull, and the anns standing to their credit were passed for payment to their nominees.

The sack-py for the month on the ordinary side amounted to £50 18s., on the State Section to £18 16s. 8d., and maternity benefits to £9. Owing to the Registrar-General disapproving of a separate rule-book for the admission of juveniles, a special general meeting will be held on July 9, 1917, at 8 p.m., at the R.H.S. Hall, for the adoption of partial amendment of the existing rules.

Obituary.

GEORGE ABBEY.—We regret to announce the death, on the 1st inst., at St. Albans, of Mr. George Abbey, one of the best known of the older school of horticulturists. He was a keen gardener from his earliest years, and while still a young man attained considerable success in his profession. In later life his work was chiefly literary, and he contributed freely to the horticultural Press, principally to the *Journal of Horticulture*. He assisted the late John Wright in his popular work *The Flower-grower's Guide*. During recent years he made a special study of garden pests and diseases, and wrote freely on that phase of gardening, illustrating his notes by simple diagrams. Mr. Abbey attained some time since to the ripe age of eighty-one, and retained to the last all his faculties. His illness was very short, having become serious only a week before his death. His wife died some seventeen years ago; he leaves three sons and one daughter.

CROPS AND STOCK ON THE HOME FARM

THE PLOUGHING UP OF GRASS LAND.

THE appeal to farmers by the Government to increase the amount of arable land in the country by 5,000,000 acres for the season 1918 presents difficulties to the farmer. Each county has been asked to plough a certain acreage; in this county, Hampshire, the amount is 90,000 acres. Many persons set too much store on grass land for hay, whereas in many instances the land could be made much more profitable under arable cultivation. A much greater bulk of hay can be obtained by high cultivation and the growing of rotation grasses such as Clover and Italian Rye, than by ordinary methods. Many acres of permanent pasture produce only one ton of hay per acre, or less, whereas as much as three tons per acre can be obtained from rotation crops. The hay from the latter, too, is of much more value to the Army than meadow grass. For milk cows grass must be provided. In this county the allowance is three acres per cow; in some instances—for cheese-making 3½ acres is the rule.

If the pastures are rich in herbage, and other foods, such as Mangold and Cabbage, can be obtained from arable land, two acres per cow are ample. On this principle there need be no hesitation in ploughing up certain grass fields, even where cows are an important item of the farm; but the needs of young stock must be considered also. Many persons cling to their pastures on the score of economy in cultivation, which was a matter for consideration when crooks were a low price. Land under arable cultivation is much more productive when in corn and cattle food than in grass, and on that principle farmers should not hesitate to alter their methods. The Government do not wish that grass should be ploughed up indiscriminately; they know quite well that good pastures cannot be made without expense. At one time it was thought the bulk of the 7,000,000 acres was required for Wheat alone for 1918. That impression is not true, as any cereal crop may be grown. This option renders the work of preparation easier.

PREPARING FOR THE 1918 WHEAT CROP.

For Wheat to be grown during 1918, no time should be lost in preparing the land. There are

two methods of preparation: (a) First plough the sward 2 inches deep with a view to killing the grass by exposure to the sun and wind; plough again, this time crosswise, at the same depth, and in the disintegration of the ground. If this work is well done during the next three months, there is a good prospect of success, as much labour for wireworm will have been removed. A dressing of farmyard manure at the rate of 15 to 20 tons per acre should be evenly spread and ploughed in this time to a depth of 5 inches, which will be sufficient to bury the loose turf. Press the land firm as the ploughing proceeds, and sow the Wheat as soon in October as convenient. The above method is a good way of dealing with stiff land. (b) Soil of a light character should be dealt with as follows: Skim the surface, plough and press the land at once 5 inches deep, and sow with Mustard at the rate of 20 lb. per acre. In ten weeks the Mustard should be from 1 foot to 2 feet high; it can then be felled off to sheep or ploughed in, pressed, and sown with Wheat at will. Mustard, even without manure, is a good preparation for Wheat. Mustard, too, beyond its manurial properties, counteracts the attacks of wireworm. Sulphate of ammonia applied at the rate of 1 cwt. per acre at sowing time would accelerate growth, and thus mitigate wireworm attack. Where Oats or Barley are to be sown, there will be more time for the necessary preparations, as the land need not be ploughed until February. The grass in the meantime can be fed to stock *E. Molyneux*.

SEED WHEAT OF THE 1917 CROP.

IN view of the importance of providing seed Wheat for next year's harvest, the Government propose to acquire pure stocks of certain of the best plentiful varieties of autumn Wheats. Crop in adequate quantity found after inspection to be suitable for seed will be purchased at a substantial premium above the milling price. Farmers with pure crops of not less than 20 acres of the following varieties, viz. Wellington, Victor, Little Bess, or Browick, are requested to communicate in care with the Director-General, Food Production Department, 72, Victoria Street, London, S.W. 1.

In writing to the Department, the correspondent should state his name and address, the variety of Wheat, the area sown, and the location of the crop.

ANSWERS TO CORRESPONDENTS.

ARABIS SEROTINA. *W. D.* There is no fungous disease present on the plant of *Arabis serotina*. The unsatisfactory condition of growth is due to some wrong cultural treatment.

CHERRIES DROPPING. *C. M. L.* Cherries often turn yellow and drop after they have grown about the size of Peas. The trouble may be due to one or more causes. If growth is enfeebled, the fruits may fall at the storing period, whilst a lack of lime in the soil may be responsible. Let the wood receive plenty of sunshine to favour its ripening, training the shoots well apart to allow the sunshine to enter the tree. Fork old mortar rubble or other material containing lime into the soil.

DYING PEAS. *J. B.* Certain varieties of Peas can be dried for winter use, including Little Marvel. The Peas can be left, pods and all, on the plants, and dried by the sun, or, if the season is wet, either the whole plant can be pulled up and dried hanging in an airy shed, or the pods can be gathered and the Peas dried in trays. The former method results in most success, but in any case the dried Peas, when cooked, will not have the colour or flavour of fresh ones. They must be soaked in water with a little carbonate of soda for twenty-four hours before cooking, and be boiled for about an hour in water alone.

INSECTS ON BOX. *J. H. S.* The small greenish-yellow fly present on your bushes is a common pest of the Box. Spray the plants with a nicotine compound.

NAMES OF PLANTS. *J. J. H.* *Hyoscyamus niger* (Hebanth). *G. E. C.* 1, *C. Coenocentrum frigidum*; 2, *Pyrus rotundifolia*. *C. Carlisle*,

Aesculus flava var. *sanguinea*. *Caplain* 1, *F. B.* *Prunus cerasifera*, the Cherry Plum; 1, *L. L.* 1, *Robinia hispida*; 2, *Deutzia crenata* *flora plena*; 3, *Clematis* sp.; 4, *Clematis recta*; 5, *Codonaster Simonsii*; 6, *Spiraea canescens*. *J. D. H.* *Polystichum venustum*. *O. B.* *Kent*, 1, *Amaryllis reticulata*; 2, *Zephyranthes carinata*; 3, *Maranta regalis*; 4, *Dieffenbachia speciosa*. *F. F. H.* 1, *Jasminum Sambac flore pleno*; 2, *Peperomia arifolia*; 3, *P. recliniflora*.

PEAR MIDGE. *J. P.* The Pear tree is attacked by the Pear Midge. You cannot usefully do anything this year, but next spring hand-pick all abnormally swollen fruits. If possible, remove and sterilise the surface soil; or, as an alternative, apply a good dressing of Kaint to the ground, or an application of ground insecticide immediately before the perfect insects emerge in the spring.

FIG. 3.—THE PEAR MIDGE. (1) Young larva cut open, showing larvae inside; (2) larva, not so large; (3) larva, magnified; (4) male terminal joints of the antennae; (5) male terminal joints of the wing; (6) middle joints of female antennae; (7) female ovipositor.

PEAS FAILING. *I. C. N.* Edworms were present in some of the plants, and the mycelium of a fungus was also present. Destroy all badly affected plants by burning.

POTATO FAILING. *H. S. E.* The Potato is not affected by specific disease due to fungous or insect pest. The failure of the foliage to develop is probably due either to some error in cultivation, or to inherent weakness in the seed.

POTATO EATEN BY MOTH. *T. L.* The Potatoes are attacked by the Rusty Moth (*Hydracra nuceana*), which is now in the larval or grub stage. It is not a very serious pest, but you should pick off all the parts of the haulm which are attacked and burn them.

Communications Received. W. S. R. (Thanks for 25, 30, 40, 50) D. N.—F. A. F., M. N., N. G., G. A., W. E., B. E., C. S. M., R. S. and G. P. H. C. R. D. W.—J. E. H., B. D., J. G.—W. J. G., C. A. B., T. C.—J. H. H. F. A. W., W. J. H., A. L. C. S.—E. K. H. M., P. E. M., W. F. R. J. M., W. T. S., D. C. C. S. S., W. T. F. H. H. J. L., H. T. S., A. B., G. W., B. C.

MARKETS.

COVENT GARDEN, July 7.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots such as Aralia Sieboldii, Asparagus, and various ferns with their respective prices per dozen or per pot.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers such as Achillea, Aist-cornelia, and various carnations with their prices per dozen or per bunch.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage such as Adiantum, Asparagus plumosus, and various ferns with their prices per bunch.

REMARKS.—White Pinks are practically over, and the only white flowers available are Anthea The Pearl, white Stocks, and Pelargonium. The first arrivals of Asters are expected in a few days. Hardy flowers are in demand,

and the supply is only moderate. Spanish Irises are over, and Gladioli are of very poor quality. White and mauve Sweet Sultan are arriving in excellent condition, and find a ready sale. There is a limited supply of Scotch Peas, and prices are a trifle higher. Libanus longiflorum and L. lanceifolium are arriving in better condition, but prices remain firm.

Vegetables: Average Wholesale Prices.

Table listing vegetables such as Artichokes, Asparagus, Beans, Beetroot, Cabbages, Cauliflowers, Carrots, Cucumbers, Garlic, Greens, Herbs, Horseradish, Leeks, Melons, Onions, Peas, Potatoes, Radishes, Shallots, Spinach, Turnips, and Watercress.

Fruit: Average Wholesale Prices.

Table listing fruits such as Almonds, Apples, Aubergines, Cherries, Currants, Dates, Figs, Gooseberries, Grapes, Lemons, Melons, Nuts, Peaches, Raspberries, Strawberries, Tomatoes, and Walnuts.

REMARKS.—A good supply of Victoria Apples and Peas are still on offer, they have not sold so readily as anticipated owing to the fact that many other fruits are in season. Grapes, Peaches, Nectarines, and Figs are plentiful but Melons are scarce and dear. Supplies of Strawberries are well in demand and Raspberries are coming in. Grapes, Peas, and other vegetables are plentiful. With regard to cherries there are some good supplies of the following varieties: Early Hovey's, May Duke, and Lion Heart. Marrow and cucumber are in limited supply. Early Potatoes are very plentiful. F. H. E. Covert, Covent Garden Market, July 7, 1917.

GARDENING APPOINTMENT.

Mr. J. Bowyer, 20, Goodwood Street, LAMBETH, E.C. 4, has a large stock of Garden Appliances, Garden Tools, Garden Hose, Garden Sprayers, Garden Rollers, Garden Carts, Garden Arches and Hand Lights, which he shall be pleased to clean at special prices, subject to being used.

SCHEDULE RECEIVED.

Vegetable Fruit and Flower Show to be held at Hampton Park, Bury, on September 1, 1917, in aid of the funds of the Red Cross Society. Hon. Sec., Mr. H. G. Brown, Hampton Park Estate Office, Putney, Bury.

THE Vegetable Garden.

This is an English translation, made by Mr. W. Robinson, of the celebrated work by the world-famous growers,

MESSRS. VILMORIN, ANDRIEU & CO.,

of Paris. There are no market growers to equal the French, and in this work English readers will find placed at their disposal, in readable and interesting form, all the experience and knowledge of centuries of successful cultivation. All the principal vegetables, including many which are at present unfamiliar to English growers, are fully dealt with; and numerous clear and informative illustrations give point to the instructions contained in the text.

EVERY FOOD PRODUCER

should obtain a copy of this book, which will enable him to get the very best results out of the ground at his disposal.

THE HORTICULTURAL DIRECTORY AND YEAR BOOK.

INDISPENSABLE to EVERY GARDENER and NURSEYMAN.

In this, its Fifty-Eighth Year of Publication, this indispensable work has undergone a thorough revision. Every page has been purged of out-of-date, obsolete names, fresh ones added, and the whole work brought up to date. Numerous Fresh Features have been introduced, including a

CALENDAR OF GARDEN OPERATIONS
AND A LIST OF
NEW PLANTS FOR THE YEAR.

Another interesting feature is a set of Short BIOGRAPHICAL NOTICES of **PROMINENT HORTICULTURISTS and NURSEYMEN** who have passed away during the year. Thus, by obtaining this DIRECTORY at the beginning of each season, one is enabled to keep pace with passing events in the horticultural world. There are still for sale a few copies of the current edition.

SPRING CABBAGES.—The best varieties to sow during the early part of August. Order at once.

SUTTON'S HARBINGER CABBAGE.

The earliest Cabbage for Spring Cutting. Per packet, 1s. 6d. per ounce, 1s. 6d.
Trial of Autumn Cabbages. A trial of no less than 114 stocks, representing 94 sorts, was made at Witley last year. . . . It will be noticed that Sutton's Harbinger is the only sort that did not show any signs of autumn rot and spring-sowing. "The Field," June 17, 1916.
Cabbage Harbinger is a capital variety. I sowed some seed in July, and now (January 10, 1917) I am cutting some lovely heads. —Mr. A. F. Coles, The Gardens, Wallasefield, Creydon.

SUTTON'S APRIL CABBAGE.

The most popular early Cabbage for garden use. Per packet, 1s. 6d. per ounce, 1s. 6d.
"The April Cabbage" you all possess me with last year have done wonderfully well, hardly a plant has been destroyed by the severe winter, and they are now coming in very useful."—The Rev. F. J. Briggs, May 4, 1917.
The April Cabbage, raised from seed sown by you last year, was wonderful. They were a really heavy batch of plants, and not one bolted! —Mr. H. Bryant, Framfield.

SUTTON'S FLOWER OF SPRING CABBAGE.

The most suitable for the general Spring crop. Per packet, 1s. 6d. per ounce, 1s. 6d.
My bed of Flower of Spring Cabbage was well worth a photograph, and looks better than any others in the neighbourhood. —W. Webb, Esq., Dursley.
"I consider your April and Flower of Spring the best Cabbage in cultivation. Last September I planted 2,000 of each, and in the whole plantation there were but four plants not true to character. The bulk of these are being sent to the Food through the Vegetable Products Committee."—Mr. T. R. Scholey, Kilsython Gardens.

SUTTON & SONS, The King's Seedsmen, READING.

GISHUR'S COMPOUND has over half a century's reputation for effectiveness in preventing and destroying Red Spider, Scale, Mealy Bug, Green American Blight and Brown Fly, &c. Sold in boxes about 1lb., 3lb., and 12lb., by Dealers in Garden Supplies. Wholesale: PHOENIX PATENT CANDLE CO., LTD., Battersea, London, S.W. 11.

EVERY GARDENER'S LIBRARY contains a certain number of indispensable books. Some gardeners have a small library, others a pretty complete collection of modern books on cultivation, some few are the fortunate possessors of books on every phase of gardening, both old and new, from the early Herbals to the last new American Crispia. There is one little book which should be found on the shelves of every gardener, young or old, literary, scientific, or practical, and which is consulted a thousand times a year by those who possess it. That is the "Horticultural Directory and Yearbook." There is so much in it. It is a veritable mine in parvo. This year it is smaller than usual, because it has cast off a dead weight of out-of-date, obsolete names; but it is steadily growing again, and is already preparing fresh names for the 1918 edition. There are still some copies left of the present year's issue. The price is 1s. 4d., post free. Do not let your library remain incomplete for lack of this indispensable volume. Send for it to the Librarian, "Gardeners' Chronicle," 41, Wellington Street, Covent Garden, W.C. 2.

BRITAIN'S GREAT CABBAGE.

WEBB'S EMPEROR CABBAGE. (For July and August sowing.)

Earliest, best, and most popular Cabbage in cultivation. "Remarkably free from any tendency to 'bolt.'" 6d. and 1s. per packet, 1s. 6d. per ounce, post free.
Mr. G. Ellwood, Head Gardener to W. H. Myers, Esq., Swanmore Park, writes: "I should like to testify to the excellence of your Emperor Cabbage; it is really a gem, fit for private gardeners or market growers alike, and of splendid quality."

WEBB'S FAVORITE CABBAGE. Early medium sized heads, of splendid quality. 6d. and 1s. per packet, 1s. 6d. per ounce, post free.

**THE UNIVERSITY OF LEEDS
DEPARTMENT OF AGRICULTURE.**

Applications are invited for the position of additional
lecturer in Horticulture, commanding salary £350 per
annum, a man or woman with sound horticultural train-
ing is required. Applications will be received up to 25th
July, 1917, and should be addressed to The Secretary,
The University, Leeds, from whom further particulars may
be obtained.

WANTED, HEAD GARDENER: must
be married (without family) and thoroughly ex-
perienced, good cottage provided. Address with full
particulars to S., Buckhurst Park, Assot.

**WANTED, HEAD WORKING GAR-
DENER,** 2nd-all-round man; able to maintain
supply of Vegetables for large establishment, under Glas-
house, Peaches, Grapes, Tomatoes, Cucumbers. Plants
(including orchids) for house and bedding; good wages,
cottage, coal, and vegetable provided (not milk or light).
Applications, with testimonials (copies), in first in-
stance, to H. W. EVANS, Nurseries, Llanishan, Cardiff.

**WANTED, WORKING HEAD AS GAR-
DENER** BALFHEE, for private estate of 60 acres,
in Kent, must have knowledge of stock, able to milk,
pontry, cottage, coals, vegetables, and milk supplied.
State wages, personal references essential. M. T. Box 2,
41, Wellington Street, Covent Garden, W.C. 2.

**WANTED, WORKING HEAD GAR-
DENER;** thoroughly experienced in all branches
and ineligible for military service, wages 35s. per week,
with cottage and coal. Apply, giving references and
copies of testimonials, to MESSRS THOS FAIR & SON,
Estate Offices, Lytham.

**WANTED, HEAD WORKING GAR-
DENER,** thoroughly experienced at inside and
outside work; personal reference from last employer
required, good wages and cottage. State full particu-
lars, age, &c. MRS LECAS, Bramblehurst, East Gun-
stead, Sussex.

**WANTED, HEAD WORKING GAR-
DENER;** man and boy kept, cottage provided,
must have excellent references. Apply, C. L. G. MOORE,
Apples, Hall, Atherton.

**WANTED, HEAD GARDENER (WORK-
ING);** ineligible; good knowledge Vegetables, Fruit,
Vines, &c. country, half-hour's train London.—ADDRESS, stating
age, single or married, family, experience, height,
locality, wages required, inclusive of cottage, ADVERTISER,
Ridgeland, Shenley, Herts.

GARDENER; ineligible; good Head Work-
ing; Fruit, Flower, and Vegetable Gardens, Green-
house; cottage provided; preference given to man under-
standing electric light plant.—Write, P. BURNES,
Ridings House, Detham, Bucks.

WANTED, GARDENER, Cheshire, to
take charge, with 2 assistants, must be thoroughly
qualified; Vines, &c., motor mower, cottage. State par-
ticulars, experience, references, &c., and wages expected,
to Box E, 222, Lee & Nightingale, Liverpool.

WANTED, GARDENER (ineligible);
experienced Inside and Out; Vinery, Orchard
House, some Orchids; second man kept.—Apply, with full
particulars, to E. T. BOWLE, Mill House, Salisbury.

WANTED, good GARDENER; help
given; ineligible; must be experienced Inside and
Out, good cottage, State wages and all particulars.—
H. A. MATTHEWS, Torwood, Northwood, Middlesex.

**WANTED, good WORKING GAR-
DENER** for near Swansea; one other man kept;
no family; small cottage.—Write, stating full particulars
of age, wages required, to MRS. HENFAGE, 12, Wilton
Crescent, S.W. 1.

**WANTED, GARDENER (Inside and
Out);** ineligible; wages 25s. per week, with Beds;
—Apply, every third week, R. E. STREET, The Lodge,
Ebbingham, Surrey.

WANTED, good all-round GARDENER;
over military age; Fruit, Vegetables, Flowers,
small Greenhouse, help given; good wages.—Apply, with
particulars, SIR MARSHALL BETH, Woodcote Lodge,
Epsom, Surrey.

**WANTED, GARDENER, at once; single-
handed, handy man; experienced; 25s. and a
large, VICAR, Gerrards Cross, Bucks.**

**WANTED, GARDENER, an experienced
man, for about 1 acre under cultivation, no Glass;
Herbaceous Borders, Lawns, Vegetables, and Fruit—
Apply, Woodlands, Sanderstead Road, Croydon.**

**WANTED, SINGLE-HANDED GAR-
DENER;** Kitchen and Flower Hand; small
Greenhouse; wages 25s.—Apply, MISS WIGRAM, Chestnut
Lodge, Cobham, Surrey.

**WANTED, SINGLE-HANDED GAR-
DENER,** wages 32s. 6d.—BIRKENSHAW, Rose-
walk, Purley, Surrey.

**WANTED, an experienced married man
to take charge of Pleasure Grounds; ineligible or
over 45; permanency to good man; a modern cottage
provided, also Man to assist in Houses.—Please state full
particulars and wages required to J. L. MARWOOD, The
Gardens, Busbridge Hall, Goldingham.**

**WANTED, a MAN, to work chiefly under
Glass, discharged soldier or ineligible. Apply,
with full particulars and wages required, with hobby,
milk, and vegetables—F. C. PUDDLE, Stumpston Hall
Gardens, Rillington, York.**

**WANTED, a good MAN, to take charge
of Glass, Fruit, and Plants, state past experience,
30s. and furnished room. W. SMITH, Bookham Grove,
Bookham, Surrey.**

WANTED, SECOND GARDENER; over
military age; must be experienced Inside and
out, 25s. and Beds. Apply, giving full particulars, to
HON MRS F. COLBORNE, Nonsuch Park, Chessin,
Surrey.

WANTED, SECOND GARDENER for
Pleasure Grounds and Kitchen Garden; married;
ineligible. Full particulars to E. DERRHAM, Holme Park,
Ashington, North Devon.

WANTED, UNDER-GARDENER having
good experience and references; single and in-
eligible; liberal wages—Apply, T. ELLIOTT, Norton
Manor, Sutton Seeotney, Hants.

WANTED, UNDER GARDENER for
house; outside; duty alternate Sundays, pumping in
house, wages 25s. per week, good cottage and garden,
milk.—Apply, stating age, particulars, to ALFRED
CHILD, Cately House Gardens, Daventry, Northants.

WANTED, UNDER GARDENER, to
run paraffin engine, electric light, and general
utility, live out; wages 30s., 35s.—OWNER, Bakenham
House, Englishfield Green.

WANTED, UNDER GARDENER;
Flowers, Fruit, and Vegetables. Full particulars
to PERSELL, Sutherland House, Weybridge, Surrey.

**WANTED, UNDER GARDENER (inelig-
ible), with good general knowledge; married or
single; house or lodgings found, wages 25s. per week,
overtime and Sunday duty paid.—Full particulars, with
copies of references, to G. HATCH, Conenham Park
Gardens, Aldenham, Suffolk.**

WANTED, UNDER GARDENER;
single, 2nd-aid wages.—Apply, with all particulars,
to A. GROSS, The Firs, Glaston.

THE MAKING OF JAPANESE DWARF TREES.

THE little pot grown dwarf trees, which in recent years have been imported from Japan in such large numbers, are essential to call forth exclamations of admiring astonishment.

Yes, quaint they certainly are, and some of the better examples are very attractive. But to me the mystery is not so much how they are kept so small as how they are made to look so extraordinarily old.

I have a dwarf Maple which my father brought from Japan twenty-one years ago. It was then reputed to be twelve years old. I have had no difficulty in keeping it dwarf, and it has lived in the same pot all the time. I prune the tree every spring, shaping and training it as best I can to retain its original lines and character.

About every second year I take it from its pot, remove some of the old soil, and replace it with fresh. And I water it when I happen to think of it. After twenty-one years of this treatment, it is a shade smaller than when I first had it, and I do not think it looks a day older.

The dwarfing of the tree is no great mystery. It is simply a matter of keeping them pot bound, with just enough soil and water to support an annual crop of leaves, and a minimum of stem growth, and no more; that, and careful pruning and training. The same trees planted out in open ground would soon run away into large, normal, vigorous specimens. I have seen this happen. Only a few of the kinds grown as dwarfs are naturally small-growing. I have myself produced a little tree of the winter flowering Jasmine (*Andromeda nudiflora*), by growing it in a small porcelain pot for five or six years. It has six or seven twisted roots, which cling round a piece of cork before entering the soil, and a little bent trunk the thickness of one's thumb. In winter its tiny branches are laden with yellow blossom, when it makes a charming ornament in

the house. Although five or six years old, it is only eighteen inches high, and it is mistaken by most people for an imported Japanese specimen.

But some of the dwarf Japanese trees, including Oaks, Pines, and Retinosporas, although only a foot or two high, have gnarled trunks as thick as one's arm, and an appearance of very great age.

Are these trees as old as they appear, and as they are reputed and labelled to be? Fifty, a hundred, two hundred and fifty years? There are folk whose aim and object it is to look young, who grow younger and younger, until at about fifty they settle down to a permanent youth. But there is generally something which gives these people away, some feature from which age peeps out.

The object of Japanese dwarf trees is, on the contrary, to look as old as possible, but to me they always suggest the appearance of premature old age.

I have always been a little suspicious of them, and have often wondered how it was done. Then one day I was examining a dwarfed Retinospora, reputed to be several hundred years old, and offered for sale at a price which had apparently been assessed at the rate of a guinea for every year of its reputed age.

This tree was some four feet high. Its gnarled and venerable trunk, whose girth at the base must have been twelve or fifteen inches, rose from a carpet of velvet moss, and was soon lost amid the sombre green of flattened branches which lay, shelf above shelf, in perfect outline.

The illusion of a perfect ancient tree in miniature was so complete that one could easily, even in imagination, the gradual tapering away of the trunk as it neared the summit. A closer examination showed that nothing of the sort happened. A few inches beneath the topmost greenery the trunk was R.R. thinner than it was at the base, and ended abruptly by having been sawn off. Obviously that trunk had at some time run on to a much greater height, possibly eight or ten feet. That tree had not always been a dwarf. How, then, had it been produced? Possibly it had originally been grown in open ground and induced to form a thick trunk proportionate to its height of eight or ten feet, afterwards to be sawn off at three or four feet from the ground. Then probably its roots were pruned to make it amenable to potting, and its branches were trained up to hide the abrupt and rapid ending of the trunk. Normal rapid growth in open ground would obviously give the thickened trunk, which was the tree's chief asset towards an appearance of great age, and give it quicker than by growing the tree in a pot from the beginning.

To produce the girth that this specimen had attained by restricted pot culture alone might take the several hundred years which was the tree's reputed age; indeed, to produce the growth which the sawn-off trunk proved would probably, in a pot, have taken two or three times that number of years. But I think these old looking dwarfs may possibly be produced by quite another method. Perhaps they are not complete trees at all, but merely branches of aged forest trees artificially rooted and detached, potted up, pruned, trained, and then labelled as so many hundred years old. The process would not be difficult. A gnarled and stunted branch of some forest tree might be selected, and ring barked at a convenient spot by bandaging with wet moss and soil at the ring-barked spot, adventitious roots could be induced, after which the rooted branch could be detached from the main tree and potted and trained. By this method both girth and rugged bark would be obtained readily, and would at once give the "dwarf tree" a venerable and aged appearance. The subsequent process of adding the age of the parent tree to that of the detached branch and fixing the price accordingly would be a no less simple matter.

I may be wrong in my theory of how these trees are produced, but I think it is very doubtful

whether some of them have been in their pots as long as they are supposed to have been. But, however this may be, I think it only fair to add that they come to this country with ages already attributed. *Charles Elliott, Stevenage.*

THE MARKET FRUIT GARDEN.

HOME-MADE NICOTINE WASH

AS an alternative to the importation of cheap nicotine, the growing of a small patch of Tobacco plants might be allowed to every fruit-grower, without the extremely vexatious and almost prohibitory restrictions now imposed. It would be a simple matter to guard against the sale of Tobacco thus grown. The grower might be required to spray his Tobacco crop in the presence of a police-officer, shortly before cutting it, with lime-sulphur or some other stuff of such strong and offensive scent that the Tobacco leaf would be quite useless for smoking. A heavy penalty could be imposed upon the evasion of this requisition, or the sale of any Tobacco leaf, or its removal from the farm on which it was grown. Growers could make their own nicotine wash by cutting up the Tobacco plants, stalks included, and boiling them. A few trials would show the proportions of Tobacco and water necessary to produce a wash fatal to aphids and suckers. It would be much simpler, however, to obtain nicotine made in a country where there is no duty on Tobacco, and to sell it to fruit-growers at the cost of purchase, ocean freight, and delivery. The great importance of a full supply of cheap nicotine for spraying purposes would fully justify the arrangements suggested.

ATTENTION TO TOP-GRAFTED TREES.

Top grafted Apple trees have to be gone over several times in June and July to rub off the shoots that develop from the stocks below the grafts, which are astonishingly numerous, particularly where the stock trees were comparatively young when they were topped. By the way, this growth of shoots from branches which from cursory notice might have been supposed to be bare of even dormant buds, shows how little need there is to fear lack of fresh growths when trees for any reason are cut back severely. When rubbing off the shoots below grafts, the grafts themselves should be examined, in order to detect any beginning of aphid attack upon them. If such an attack is only slight and partial, it may be stopped by crushing the insects by hand; but if extensive, spraying at once is desirable. Some trees top-grafted here in the spring of 1916, and some done in 1915, have had to be sprayed for aphids. As the leaves had not curled, the operation was entirely successful. This season's top-grafting has been very successful much more so than that of last year. The small proportion of failures is now seen to have been due mainly to the covering of wax having been too thin in places, so that it opened, letting draught in to the junctions of scions with stocks, or to insufficient care in the selection of scions. As we were out of wax for a day or two an experiment on six trees was made by covering the graft junctions with Stockholm tar. This proved successful where the raffia fibre was bound so closely around the junction that the tar could not penetrate it, but failed badly where the binding was no more compact than it needs to be when wax is used. Another small experiment which failed to a considerable extent was that of covering with clay. This succeeded only where the clay was bound round with raffia fibre. Where this binding was not done, the clay was first cracked by draught, and afterward's heavy rain caused it to drop off. As soon as this was noticed, the application of clay was renewed, but results show that the patching up was too late to save the grafts. *Southern Grower.*

FOOD PRODUCTION AT ALDENHAM.

The gardens at Aldenham House, Elstree, have long been famed for the high quality of the vegetables grown there, and in these times of shortage it is not surprising that the

Vegetable Marrows were sown early in February and grown in 10-inch pots in a roomy house. Bushels of fruit have been gathered from the plants during May and June, and they promise to continue cropping for some time to come. The plants are trained under the roof

Content. The seed was sown in December in boxes 5 feet long, 9 inches deep, and of the same width. The plants were grown in cool houses until they were 4 feet high. Later in the season the boxes were plunged in the open on a warm border, and the roots grew through the bottom of the boxes into the soil of the border. Some of the plants are 6 feet to 7 feet high, and bear large pods, well filled with fine Peas. Peas are also grown in 10-inch pots, but the results are not giving the same results as those in boxes, owing possibly to the greater bulk of soil in the latter. The successional rows of Peas in the open are mainly from box-grown plants, except the latest sowings. It is found that more uniform rows are obtained by this method, and the seed germinates quicker, especially when the weather of April is wet and cold. The plants are put out 4 inches apart in double rows, 10 inches wide and 100 yards long.

Half an acre of ground is devoted to Parsnips. The varieties principally grown are Student, and Tender and True, and they are growing luxuriantly in deeply-trenched soil.

Much frame space is occupied by Cauliflowers. For the early batch in April and May, seeds of Early Foreing and Magnum Bonum were sown in September, and the plants put out in February on a gentle hotbed of leaves. These varieties are followed by others grown in cold frames, which are afterwards used for growing Short Horn Carrots, Turnips, Beet, and later with Endive and Lettuce. Cauliflowers are extensively grown in the open, including Mr. Beckett's new variety, Devoncourt, which is close-headed and pure white. It fills in a gap between Walden and Early Giant. The variety Autumn Giant is extensively planted.

The Carrot is another important crop. The variety Chien on Hen is ready to be put in frames in April, followed by larger varieties in pots. In the open there are rows 100 yards long of New Red Intermediate, Favourite, New Model, and Scarlet Model.

Potatoes are grown on a large scale in frames, principally Mallothian Early and May Queen; the former has given tubers of especially good quality this season. A white kidney variety,

FIG. 4. PLOUGHING PARK LAND AT ALDENHAM FOR POTATO PLANTING.

Photograph by R. A. Malby.

Hon. Vicary Gibbs and his skilful gardener, Mr. Edwin Beckett, have made the question of food production a matter of chief concern on the estate. Every effort has been made to produce food crops on the largest scale possible, and vegetables have been planted wherever they were likely to succeed. Some 50 acres of the park have been ploughed up and planted with Potatoes (see figs. 4 and 5). The management of the 50 acres was divided between the staff of the farm and the garden, and, as I saw the plot early in June, the prospect was most encouraging, the preparation of the soil and planting of the tubers having been done in a most thorough manner.

Much use has also been made of improvised cold frames, the lights being of a standard size of 7 feet. These temporary frames are sufficient to cover an area of 300 yards run. Considerable ingenuity has been displayed in the choice of material for the bases of the lights. In some cases shrub and tree prunings have been used by building them into walls 2 feet to 5 feet high, on which to rest the lights (see fig. 6). The frames are of great value in hastening the development of such crops as Potatoes, Turnips, Spinach, French Beans, Beet, Carrots, Cauliflowers, and Vegetable Marrows.

Onions have been planted extensively. The seed of the main batch was sown early in February in boxes in a cold frame, and directly the seedlings were large enough to handle they were transplanted direct from the boxes into rows 100 yards long and 15 inches wide, the plants being 3 inches apart in the rows. The varieties Mammoth, James's Long Keeping, Brown Globe, and Bedfordshire Champion are those most favoured. The present appearance of the plants on a quarter-acre plot promises well for a good crop of bulbs. Alongside is a corresponding plot planted with seedlings raised in the open from a March sowing. Large breadths of Tripoli Onion are also grown. For early spring use the Queen variety sown in July is found superior to any other, inasmuch as even when sown so early few of the plants "bolt," and they are ready for use early. There is also a splendid bed of Mr. Beckett's new lettuce-keeping variety, Autumn Triumph

and down the back wall of the house. A succession is provided by plants in frames started over a mild hotbed, from which the lights are removed later for other crops. Marrows are also grown on ridges of soil in the open among forest trees to continue a succession, the slight shade afforded by the trees reducing the need for watering so frequently as in the open. The best varieties are Table Dainty, Penny Bvd.

FIG. 5. THE POTATO CROP IN ALDENHAM PARK IN JUNE.

Photograph by R. A. Malby.

The Sutton, Moore's Cream, Long White, and Long Green.

Peas are regarded as an important crop in these gardens. Even for early supplies small-podded varieties are not favoured, but such sorts as Edwin Beckett, Duke of Albany, and Quint

named Wycombe Star, is of great promise as an early forcing sort.

Horseradish is planted in a different manner than that usually practised. The roots are placed horizontally on raised beds 1 foot high and a yard wide and covered with soil.

Celery for the earliest supplies is grown in frames, and successive batches are planted on the flat, thus saving the labour of preparing trenches. Blanching is done by banding the stems with brown paper, which allows of the roots being fed easily with liquid manure. For

greater advantages in production than in Runner Beans. The double rows at Aldenham are 10 inches apart, and the plants the same distance asunder. The plants produce large quantities of pods, and grow to a height of 14 feet. I noticed the following novelties in

FIG. 6. MAKING A TEMPORARY FRAME OF STAKES AND BOGIES AT ALDENHAM FOR GROWING VEGETABLES. (See p. 12.)

the latest supplies the ordinary trench system is adopted. The alleys in the Asparagus beds are filled with Celery this season in place of Lettuce and Cauliflowers, which are usually grown. Aldenham Pink and Aldenham White are the varieties mainly grown. A supply of Turnips is provided for nine months in the year. The earliest roots of the red and white M. n. type are grown in frames on a mild hotbed, and later batches in cold frames. Such sorts as Snowball and Orange Jolly are sown at short intervals in the open.

Spinach for winter is sown thinly in frames in September. The crop is ready for use quickly, and a supply of leaves is available for a long time, but the plants are given extra protection during very adverse weather.

Rhubarb is regarded as a valuable crop. The Sutton is the main variety grown, and a row of this sort 20 yards long has been planted from last season's forced roots at the feet of a wooden fence with a southern aspect. The slight shade afforded by forest trees growing near has aided growth considerably, and with a slight covering of straw, early Rhubarb will be obtained from the plants next year.

Many thousands of Brassicae, including Broccoli, Cauliflowers, Savoys, Landrard Kale, Thousand-headed Kale, Green Curled Kale, Brussels Sprouts, Coleworts, and Cabbage in variety, are set amongst young plantations of forest trees.

Chilian and Seakale Beet find a place in these extensive culinary crops.

Of the ordinary Beet, Sutton's Black and Globe are favoured; the early supplies of Beet are from frames.

Large quantities of Tomatoes are produced all the year round. Golden Perfection is the best of the golden-coloured sorts, and is becoming very popular with other growers. Sunrise is the best of the red-skinned sorts, but the most finely flavoured of all is Peach-Blow.

Leeks are grown extensively, Pritzetaker and Lyon being the chief varieties.

In no vegetable crop does thin planting give

ORCHID NOTES AND CLEANINGS.

ABNORMAL FLOWERS OF CATTLEYA MENDELII.

MR. KENOT, The Gardens, Bloomhill, Spreaton, Northants, sends three abnormal flowers of *Cattleya Mendellii* with the following remarks: "I have seven plants out of an importation all of which, each time they have flowered, show the same peculiarity. If there are two petals then there is no lip, and when there is a lip it comes as in the flowers sent. I have flowered the plants three years, and the result is always the same."

The fact of the abnormal characters being constitutional and not altered by high cultivation is worthy of recording, for doubts have been raised on this point.

One flower sent has the sepals and petals nearly normal, but there is no trace of a labellum. The other two flowers have one of the petals placed in the position usually occupied by the upper sepal. The other petal is merged in the lip, one side of which is petaloid and bluish-white, the other half having the red-purple colouring of the normal labellum. The lateral sepals, which also show traces of the second petal, are placed where the petals usually appear, and the columns of all three are thinner than in the normal flower, much less curved, and with the anthers more or less terminal. In 1895 an importation of *Cattleya Mendellii* flowering in the collection of the late Joseph Broome at Llandudno all showed the same abnormal characters, and the abnormality was tolerably common in other gardens. The production of occasional abnormal flowers is not rare in most Orchids, but in the case of this *Cattleya* there is distinct evidence that it is a fixed character in the plants in some locality. With regard to the earliest importation of this inverted type it was stated that the plants were collected growing on cultivated orange trees, but that could have no bearing on the case.

NOTICES OF BOOKS.

TWO NEW BOOKS ON VEGETABLES.*

Vegetable Culture for All, by "Eva," is written in plain, everyday English. As a rule, the authoress knows what she is talking about, and, though one could scarcely recommend the volume to those experienced in kitchen gardening, nor even as an infallible guide to the inexperienced, still its teaching cannot but be of value to amateurs and allotment-holders generally. Like all good teachers, the authoress engages the sympathy of her readers from the outset, and, will you, will you, it is carried irresistibly onwards from chapter to chapter. Her quaint comicities and illustrations do not fail to point the moral they are intended to enforce; and, like all books that count, this one draws its reader to a second perusal. The authoress does not attempt to do more than just notice the very commonest kinds of vegetables, though one chapter is devoted to "rare" vegetables, which are not at all rare in well-appointed gardens. She is frequently irrelevant, too, breaking off the thread of her instruction to introduce something quite apart from the subject of her chapter. Sometimes we are given a page of digression, as in Chapter XV., where a novel method of destroying weeds is described. To each chapter a vegetable recipe is appended, and the last chapter relates to "cooking vegetables," said to be even more difficult to master than producing them. She concludes with this exordium: "Yes, be proud! There are some legitimate prides that never fall—those sanctified by honest toil, and blessed by its reward. You will have to record some failures, but turn minor disappointments into the brave hopefulness that begins again."

In *Vegeticulture* we pass "from lively to severe," from vivid to rather dull and long-drawn sentences. On the whole, the matter is good, but the author is mistaken in his endeavour to popularise dozens of edible vegetables of the nature of which few people know anything, except, perhaps, the names. For at no time has it been more important than at present that cultivators of all classes should limit the kinds of vegetables to the valuable few—useful for food, and not difficult to produce in quantity. Many of the details regarding the production of seedlings and transplanting—speaking from the same point of view—are superfluous, but much thought has been devoted to the production of the volume, the introductory chapters being useful résumés of the various essentials to all good gardening.

SOUTH AFRICA.

THE CONSUMPTION OF MAIZE MEAL.

OWING to the growing scarcity of wheaten flour, I should like to call the attention of your readers to the value of Maize meal as an article of human food. It forms an item in the daily dietary of nearly every white family in the Transvaal, and is wholesome, nutritious, and tasty.

Maize meal (or milie meal, as it is called by South Africans) is used in place of Oat meal on the breakfast table. Johannesburg bakers add finely ground Maize meal to Wheaten meal in the preparation of bakers' bread. In my own home our bread is made with fifty per cent. Maize meal and fifty per cent. Wheaten flour.

A pamphlet published by the Transvaal Department of Agriculture in 1909 gave 154 selected recipes in which Maize in some form is the main ingredient. *J. Butt Davy.*

ON INCREASED FOOD PRODUCTION.

LEAF MINERS

AN easy and safe remedy to prevent flies from depositing their eggs on the foliage of Celery and Parsnips is to dust the plants occasionally, and always after rain, with spent carbide.

We obtain the spent carbide in small bags from the garage, and after being kept in a dry shed for a short time a bag is tied on the end of a stick, and dusting proceeds as fast as the operator can walk. The material may also be used to ward off the Carrot and Onion flies, but it will not kill the maggots of these pests, which must be either crushed between the thumb and finger or the infested parts removed and burned.

Many weeds harbour leaf miners, and this fact is an additional reason why all weeds should be promptly removed and burned. *G. H. H. W.*

SHORTAGE OF SEEDS.

SUPPLIES of many kinds of vegetable seeds are likely to be short next season, and it is important that all growers should take great care to put the seed which they purchase to the best use.

The sowing of seeds is generally left wisely to the seed grower, but as a w.r.t.m. measure growers of vegetables may add to the available supplies by saving some of their seed. In the case of vegetables of the Cabbage tribe and of Beets, the saving of seed is not to be recommended, owing to the fact that different kinds of these plants cross so readily with one another that it is not possible to obtain good "true" unless careful and somewhat elaborate precautions are taken.

Peas and Beans are rarely cross fertilised, and it is, therefore, desirable in all the drier parts of the country that growers should leave all the pods on a few plants for purposes of seed saving. In the case of Peas, when the seed-bearing plants are beginning to dry off, the whole plant should be pulled up and hung in a dry, airy place in order that the seed may ripen. Finishing seeds must be protected from birds, for otherwise much of the seed may be taken by them, especially by jays and hawfinches. Broad Beans may be picked when almost ripe and laid out thinly to dry. Dwarf and Runner Beans to be used for seed-saving purposes should be pulled by about the second or third week in September and hung in a dry, airy shed. When the pods are dry, the seeds should be removed, spread out until they are thoroughly dry, and then stored in a cool dry place away from mice.

Seed should not be saved from biennial plants (such as Carrot, Beet, Parsnip, and Onion) that have "bolted." In order to save seed from such biennials, good roots should be chosen and grown on to seed in their second year.

RUNNER BEANS FOR SOUPS.

SEEDS of Runner Beans have been used in my house for soups and for "Beans and bacon." Lately, also, they have been very successfully substituted for Lentils in that excellent dish, Lentil cutlets. In my opinion, there is nothing in which they are not quite as useful as Lentils. Like Lentils, they have to be soaked a long time previous to use. After soaking, they must be skinned, which is an easy matter then, but not after cooking. This is an important point. When skinned, they have the pleasant white appearance of Lentils or Butter Beans. The Runner Beans, being larger, are better fitted for these purposes than the dwarf kinds. If any of your correspondents should wish for the recipe for Runner Bean cutlets, I shall be pleased to give it. *S. Jackson, Arley, Port Hill, Shrewsbury.*

THE KITCHEN GARDEN.

By J. DRUX, Foreman, Royal Gardens, Windsor

TURNIPS.—A large sowing of Turnips should be made about the middle of the present month to obtain roots for use during autumn and early winter. Ground which has been occupied by Early Peas or Potatoes is suitable, and will only require to be lightly ricked up and levelled. When the surface soil has been made fine draw the drills 16 inches apart and sow the seeds thinly. As soon as the plants are large enough they should be thinned to 9 inches apart and the ground lightly hoed to destroy small weeds. Turnips are benefited by frequent dustings of sifted wood ashes. Another sowing should be made 10 days later, and the plants of this batch may be allowed to stand in the ground throughout the winter. Protection from frost may be necessary, but this is easily applied. Green Top Stone and Orange Jelly are reliable varieties for planting in winter.

WINTER GREENS.—The planting of all winter greens should be accomplished as quickly as possible. Savoy, Hardy Cabbage, Scotch Kale and Sprouting Broccoli should be planted freely. There is still time to transplant Autumn Self-Protecting Broccoli and Halloween Giant Cauliflower in rich soil; the heads should be ready for use in October and November. The varieties Early Market Broccoli, Snowdrop, and Early Feltham will, if planted now, and the weather is favourable, furnish a succession of heads through January. Other varieties for late supplies should be planted as soon as possible.

ENDIVE.—A sowing of Batavian Endive should be made at once for early winter supplies; transplant the seedlings in a sheltered position as soon as they are large enough for transplanting, allowing a space of at least 15 inches between the plants each way. Another sowing should be made ten days later and the seedlings transplanted into cold pits for use during winter and spring. It is much better practice to transplant these seedlings into pits while young than to grow them in an open border for lifting and placing them in pits in the late autumn. Early Endive may be tied up for blanching as soon as of sufficient size.

SPINACH.—This crop will require much care and attention during the next few weeks to obtain a full and continuous supply of leaves. Make weekly sowings in a cool situation and give the plants a plentiful supply of water. At Frogmore we sow broadcast, so that the plants cover the surface very quickly, and they are watered freely, the ground never becoming dry.

LETTUCE.—Make sowings of Lettuce weekly on a north border or other position protected from hot sunshine. Sow thinly and regulate the plants as soon as they are sufficiently advanced for thinning. If weekly sowings are made transplanting will not be necessary during the next few weeks; in dry weather the plants will succeed better in the seed rows than if they are transplanted.

FRENCH BEANS.—A sowing of French Beans should be made in rich soil with a view to producing pods about the end of August. Allow plenty of space between the rows; plants 8 inches apart in the row will give a good result. Plants in bearing should be given a good watering at the roots, for if growth is stunted through drought the crop will be unsatisfactory.

CABBAGE.—In late districts sow Cabbage seed for early spring supplies thinly in shallow drills made 15 inches apart. Keep the ground free from weeds. Another sowing should be made ten days later. Protect the plants from birds by netting and dust the seedlings freely with soot or lime as soon as they appear through the surface.

FRUITS UNDER GLASS.

By JAS. HUDSON, Head Gardener at Gunnersbury House, Acton, W.

EARLY PEACH AND NECTARINE HOUSE.

As soon as the house is cleared of the crop, let the roots be given a thorough soaking of clear water. Then apply a light dressing of artificial manure, not to the extent of exciting growth, but rather to build up and solidify the wood. Use a fertiliser containing phosphates and potash. Keep the trees well syringed, to prevent attacks of red spider, and if this be done only once a day, select the evening. The houses should be thrown open completely, removing the top lights entirely if they can be taken off. When the lights are removed, the trees can be well syringed from the upper side.

LATE PEACHES AND NECTARINES.—If the trees in cold-houses are bearing heavy crops, the fruits should be thinned finally, leaving a little margin for eventualities. See that the trees are not dry at the roots, and apply a manurial stimulant if it is considered necessary. Attend to the regulation of the growths, and stop all very luxuriant shoots at an early stage of their development. Syringe the trees twice daily in sunny weather, and do not hasten growth unduly by closing the houses early in the afternoons.

STRAWBERRIES FOR FORCING.—Runners of the latest varieties of strawberries intended for forcing should now be layered. Fillbasket, which makes its runners later than many others with us, is one of the very best late sorts, being a reliable and good cropper. Runners of other varieties should be slanted into 6-inch pots, as soon as they are fairly well rooted; do not, on any account, allow them to become pot-bound. If the plants are stood pot to pot for the time being it will be an easy matter to keep them lightly damped overhead. Meanwhile, when opportunity offers, prepare a site for standing the entire stock of plants. Choose a situation exposed to full sunshine. The ground should be well surfaced with ashes and sprinkled with lime to keep worms in check.

AUTUMN-FRUITING STRAWBERRIES IN POTS

Autumn fruiting strawberries give good results in pots, and form a good succession to the outside plants and the early forced plants that are held over to a second crop. My plan is to do in the runners as early as possible and to pot them direct into 4½ inch pots, which are sufficiently large for the purpose. The runners will quickly become established. In some instances I have noted that the first flower spike develops even before the runner is severed from the parent plant, and it is hardly advisable to retain these precocious plants unless for very early fruiting in the autumn. A crop may be had from these young plants in from ten to twelve weeks from the laying. The best varieties for forcing are Merveille de France and St. Antoine de Padoue; St. Fléaire is also highly spoken of.

THE FLOWER GARDEN.

By W. J. GIBSE, Gardener to Mrs. DEMESTER, Keele Hall, Staffordshire.

GNAPHALUM LEONTOPODIUM. It may not be generally known that the "Lidoways" is easily raised from seed. Sow in pans in a mixture of loam, mortar rubble, and sand. A clear shaded frame is the most suitable place until the seed has germinated. The young plants should have the sunnet position in the rock garden, using a similar compost as advised for use in the seed pan.

VIOLETS. Cut off all runners from Violets within two eyes of the base; on no account should they be pulled off. Give the plants a light dusting of soot occasionally to keep red spider in check. Keep the soil always loose on the surface by the use of the flat hoe, and syringe the plants overhead in the evening during dry weather.

FLOWER BEDS.—The summer bedding plants are well established. The soil in the beds should be stirred on frequent occasions, and especially after rain, when it is liable to become caked on the surface. Edging plants require attention at least once a week, pinching them into shape as they require it. Ivy-leaved Pelargoniums, Verbenas, Petunias, Iresines, and

other plants that are used as a groundwork should be pegged to the soil and the shoots pinched to cause side growths to develop and fill the space.

EAST LOTHIAN AND BROMPTON STOCKS.

Sow seeds of East Lothian and Brompton Stocks to obtain sturdy plants for flowering next spring and early summer. Raise the plants in cold frames, but do not coddle them; for the present the lights may be removed entirely. Old potting soil of a rich nature mixed with a little fine mortar rubble or lime will form a suitable compost. Make the soil firm. Spray the seed bed daily and provide light shades during sunny weather until the seed has germinated. Plants in bloom should be given stimulants to prolong the flowering season.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcote, Eastwell Park, Kent.

BEONIA GLOIRE DE SCLAUX.—This variety is one of the best Begonias for flowering in winter and early spring, the bronzy metallic lustre of the foliage (which is quite ornamental in itself) contrasting well with the panicles of bright rosy-pink flowers. If grown in ordinary conditions, the variety is at its best in the spring; but if it is given on early in the summer, and placed in a brisk heat in the late autumn, it will bloom at Christmas and the New Year. The plants are suitable for the decoration of rooms, the moderately warm and dry conditions exactly suiting the flowers, which last well. The variety may be propagated and grown under similar treatment to that recommended for the Lorraine type. Cuttings strike freely, and the plant presents no great difficulties in its after cultivation. It should not be allowed to become pot-bound till it has been placed in its flowering pots. Specimens of all sizes flower satisfactorily; 4½ inch and 6 inch are useful sizes for general purposes, but if large specimens are wanted, 7½ to 8 inch pots will not be too large. Whatever the size, when the pots are filled with roots, feed the latter regularly with stimulants. Stand the plants well apart in a light house to ensure specimens of good shape and undamaged foliage.

BROGMANIA DATURA.—The somewhat old-fashioned plant is worthy of a place in a general collection of cool-house plants. It can be planted out in the conservatory bed, or small border, or grown in large pots or tubs. In the spring it should be pruned hard back within a foot or two of the old wood. Growth starts freely as the weather gets warmer, and the plant will commence to flower in June, and continue to do so till late autumn. The habit of growth of this plant makes it very suitable for training as a standard. The plant should be kept to a single stem till the desired height is attained, pruning back the head each spring as for a standard Rose. B. Knightii, B. albana, and B. sanguinea later are the principal species, and all are well worth growing.

HARDWOODED GREENHOUSE PLANTS. Many other hard-wooded indoor plants will also succeed better if placed in the open during the next three months. The foliage will be more healthy and vigorous, and standing the plants outside presents a good opportunity to thoroughly cleanse them. All the members of the Heath family—*Coronilla glauca*, *Coprosma*, *Baneri*, *Diosma* *aroides*, *Azalea*, growing in pots or tubs, *Eupatorium*, greenhouse *Eleocharitoides*, *Chlorizema*, *Cytisus*, *Myrtles*, *Ononises*, and *Limonis*, may be treated in this way. Plunge the pots in a bed of ashes, to keep the roots in a fairly uniform condition of moisture and syringe the top growth daily in bright weather. Use clear, well-diluted soot water once a week for syringing, and water the plants with liquid manure about twice weekly.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVES, Abbot's Wood, Godalming, Surrey.

EARLY APPLES.—The recent rains have benefited the trees of early Apples, which do not mature their fruits satisfactorily when the soil is very dry. The first to ripen are Mr. Gladstone, Early Margaret, Early Harvest and Irish

Peach, and they are usually ready for gathering in July. Irish Peach is of excellent quality when well grown, and to secure the fruit at its best it should be gathered just before it is eaten. This variety can be grown either as a bush, cordon, pyramid, or horizontally trained tree. Look over the trees and remove by hand picking dead and decaying leaves, or give the trees a vigorous syringing to dislodge them; thorough syringing will also cleanse the trees of insect pests.

PEACHES AND NECTARINES.—Trees of early Peaches and Nectarines with ripening fruits should be given a good dressing of concentrated fertiliser. If the roots have been watered with liquid manure from the farmyard the fruits will be swelling rapidly. During the present month fruits of Ansdan June, Waterloo, and Early Alexander will ripen. All early Peaches should be thinned evenly. The fruits should be gathered with care and placed in a box or basket containing fine, soft wood-wool, which is the best material on which to convey them to the fruit room. The shelves in the fruit room should also be covered with this material. Nectarines do not ripen quite so early as Peaches. Early Rivers and Cardinal are amongst the earliest varieties, and these are closely followed by Lord Napier. Early Peaches are best used quickly, as the flavour deteriorates when they are kept.

STRAWBERRIES.—The earliest layers are ready to be severed from the parent plants, and when this is done they should be kept partially shaded for a brief period. When they have recovered from the check caused by their removal they may either be potted or planted out. If the latter method is adopted choose ground that has been heavily manured, or they may be planted on ground that has been cropped with early Peas. Old Strawberry plants that have finished cropping should be pulled up and the ground cleared and made ready for other crops. The beds which are to remain should be cleared of rubbish and the plants watered.

FRUIT ROOM.—Keep the fruit room well ventilated and as cool as possible. If it does not contain much fruit take the opportunity to cleanse it thoroughly. Scrub the wooden uprights, shelves, and trays with soap and hot water. The fruit room should be kept spotlessly clean and free from all trace of mustiness.

THE ORCHID HOUSES.

By J. COULDER, Gardener to Sir JEREMIAH COLEMAN, Bart., Gattin Park, Reigate.

MANAGEMENT OF THE HOUSES.—Most of the potting having been done, the principal work in the Orchid houses at this season should be directed to keeping the plants in an active condition of growth and free from insect pests. It is important that the plants receive sufficient water at the roots, and that the atmospheric conditions be regulated in accordance with the weather. It will now be possible to treat the plants in the warmer divisions more liberally, and with the increased amount of sunlight and warmth, more ventilation and more moisture may be given in all departments. In the East India House, fire heat should not be dispensed with altogether. The water pipes should be kept sufficiently warm to maintain a temperature of 75° up to midnight, regulating the fires so that the thermometer records 60° in the early morning. The ventilators should be closed early in the afternoon, and the blinds drawn up directly it is safe to do so without exposing the plants to injury from scorching. The temperature of the house may be allowed to rise to 85° or 90° with sun heat. Drain the floors, stages, and other bare spaces frequently, and especially the ground beneath the hot water pipes. Spray the plants lightly overhead and on the under-sides of the leaves in order to keep down attacks of red spider and other insect pests. As a stagnant atmosphere is many plants to become spotted, on warm, damp nights open the top ventilators late in the evening; this will cause the air to circulate and dry up any excessive moisture that may have accumulated after sunset.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.
Editors and Publisher.—Our correspondents would oblige delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 17.
 Royal Hort. Soc.'s Coms. meet and National Carnation and Florist Society's meeting at Drill Hall.

AVERAGE MAXIMUM TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 65.3

AVERAGE TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thursday, July 12,* 10.3 a.m., Bar, 30.1, Temp. 67°. Weather, Sunshine.

SALES FOR THE ENSUING WEEK.

TUESDAY.—Cattle and indoor stock and implements, of the Ayrshire Nurseries, Liverpool, by Protheroe and Morris, at 11 p.m.

THURSDAY.—Greenhouses, frames, and general stock of the Stratton Approach Floral Nurseries, at four of Stoke Newington Station (G.E. Ry.), by Fisher, Stanhope and Co., at 1 o'clock.

Crops on Virgin Soil.

Among the less experienced cultivators of the many thousands of acres of waste land which are now being brought into use for the production of food, the idea is prevalent that virgin soil—i.e., soil which has hitherto lain more or less waste—is particularly fertile, and needs only to be lightly dug in order to produce heavy crops.

The belief is in the nature of a faith, in that it rests on no basis of fact or experience. It is true that in special circumstances a few plots of this nature may yield good results without much trouble, but unless they are properly cultivated and manured the far greater number yield very meagre crops. Indeed, it may even happen that the more labour expended the less satisfactory the yield, since it has been observed that in a number of cases the more deeply the soil has been dug, the more thoroughly has the sub-soil been exposed, and the worse has been the resultant growth of the plants.

Such failures have been attributed to many causes. The seedsman has in many cases been unjustly blamed; or, with more justification, the exceptional season, consisting of an almost unprecedentedly cold, late spring, followed by an early summer drought accompanied by blazing sunshine.

It is hardly necessary to point out that the fact of the sterility of virgin soil is well known to experienced cultivators, farmers and horticulturists alike. The farmer may induce fertility by the simple

method of spreading over his freshly ploughed land a layer of earth from one of his older fields. The gardener, working in a more intensive area, corrects the weak, spindly growth which is the result of growing plants in new soil, by the judicious application of manures and fertilisers rich in nitrogen. For it is nitrogen-starvation which gives to plants growing in virgin soil the stunted appearance which characterises them. The soil may be rich in nitrogen; but not in a form by which it can be assimilated by the plants, because—and here we come to the crux of the whole matter—the micro-organisms (bacteria) by whose agency the nitrogenous compounds in the soil are converted into nitrates, are absent or deficient in numbers.

Even in normal conditions, on cultivated soil, there is always a shortage of available nitrogen in the spring. During the winter, the rain washes away a large amount of the soluble nitrogenous compounds from the soil; and the temperature of the ground is too low to encourage the nitrate-forming bacteria either to multiply or to perform their work of nitrification. As the weather becomes warmer, and conditions more genial, the bacteria become active, and the soil becomes more and more rich in nitrifying bacteria, and in the nitrates which they form. Many gardeners, though unaware of the action of the bacteria, are yet familiar with the ill-effects of this early spring shortage of nitrates, and apply nitrate of soda by way of a "whip" to their growing crops.

As we have already observed, in many instances which have come under our notice, where the ground has been dug most deeply the results have been the worst. In one set of plots under observation, a wise old cultivator warned his younger and more enthusiastic neighbours that they were doing very foolishly in "burying all the good soil at the bottom of the trench." Certainly, up to the present, his contention has been justified; for his own Potatoes are the best of any, notwithstanding the fact that the plot is full of sprouting grass. Those who brought up the subsoil to the top had probably buried the few nitrifying bacteria which may have been present in the upper layer. There is no doubt, however, that equally good results could be obtained by burying the topsoil, if generous applications were made of such material as well-rotted manure, which would encourage the rapid spread of the beneficial micro-organisms. That the failure of crops on virgin soil is due to nitrogen-starvation can be demonstrated by applying a little nitrate, when it will be seen that the plants recover in a remarkable degree. In one case under observation a patch of very weak, spindly Potatoes was watered with a nitrogenous manure. The response was almost immediate, the plants assuming a deep green colour, and the stems thickening in a surprisingly short time.

Our observations have been chiefly directed to plots on heavy soil over a thick clay sub-soil, through which percolation and aeration were undoubtedly deficient. In an adjacent district, where the subsoil

was gravelly, the crops were noticeably less unsatisfactory, probably because the better aeration and percolation favoured the spread and activity of what few nitrifying bacteria were present in the ground.

The conclusion would thus seem to be that during the first year of the cultivation of virgin soil, better results can be obtained by shallow cultivation than by deep digging, unless the cultivator is prepared to expend a considerable sum on manures which will supply all the nitrates his plants require; but that in the second year, when the surface turf has rotted, the raised subsoil been exposed to all the beneficial influences of a season's rain, sunshine and air, and the nitrifying bacteria have increased to the requisite number, the deeply dug ground will yield in every respect the more satisfactory results.

HORTICULTURAL CLUB ROOM COMMANDEERED BY THE GOVERNMENT.—Members of the Horticultural Club are asked to note that the Hotel Wimbor, Westminster (including the room occupied by the Horticultural Club), has been commandeered for Government purposes from Monday, the 16th inst. R. HOOPER PEARSON, hon. sec.

NATIONAL DIPLOMA IN HORTICULTURE.—The 1917 Examinations for the National Diploma in Horticulture were held at Wisley in June, with the following results:—Section II.—General Horticulture: THURPE, HILDA; MARGARET BURTON, The Nurseries, West Clendon, Surrey; HERON, MAY, 5, Wellington Road, Handsworth Wood, Birmingham. Section V.—Landscape Gardening: WOOLLEY, ROBERT; VERNON GIFFARD, Fair Croft, Lapworth, Warwickshire. Section VII.—Horticultural Inspection: MELVIER, DAVID GEORGE, 8, Silver Street, Enfield. The following candidates satisfied the Examiners' requirements in the Preliminary Examination:—OLDFAM, CHARLES HENRY, 25, Mill Street, Stafford; JOSHUA, LEVY HENRIETTA, 58, Forest Road, Kew; HERRING, LOTTIE KATE, Horticultural College, Swanley; THORNTON, ELEAZOR BOM, Botanic Gardens, Cambridge.

BEQUESTS TO GARDENERS.—Among the bequests made by the late Mr. LEOPOLD DE ROUSSELD are three to his head gardeners, Mr. JOHN JENNINGS receives £500, and Messrs. HUDSON and REYNOLDS £500 each. The admirable gardening work done by Messrs. JENNINGS, HUDSON, and REYNOLDS has recently been described in these pages, and this mark of recognition of their services will be appreciated, not only by the recipients themselves, but also by their wide circle of friends.

AN ECONOMIC GARDEN.—The gardens of Dr. J. E. HURRY, Westfield, Reading, have been adapted to the cultivation of plants of economic use, and the scheme, which has been pursued for several years past, has much to recommend it. The main object is that of education, and for this purpose the grounds are thrown open frequently to the public and to school-children, who are privileged to see, not only the growing plants, but also the results when the plants are gathered and prepared. A printed catalogue of the plants grown is supplied to each visitor, and demonstrations of the more interesting exhibits are given by Dr. HURRY and his assistants.

IDENTIFICATION OF GRASSES BY THEIR VEGETATIVE CHARACTER.—When the present crisis of war is removed, we hope that a counterpart of this very useful bulletin will be issued in this country. It is hard work for a beginner to get to know his grasses by means of the ordinary keys, which depend largely for

diagnostic directions on floral characters. In the bulletin each of 43 grasses is figured, and briefly described, and an analytical key to grass seedlings help the student to "run down" the specimens.

THE CULTIVATION OF SUGAR BEET.—The statement by the Parliamentary Secretary to the Board of Agriculture that a loan of £125,000 has been made from the Development Fund for the purpose of the purchase of an estate near Newark on which to establish the Sugar Beet industry, "when circumstances permit," has revived the discussion in the Press of the general question as to the possibility of growing Sugar Beet profitably in England. The associations which have devoted themselves to the promotion of English Sugar Beet growing have done most useful service. It has been proved that there is a great deal of land in this country on which Sugar Beet can be grown as successfully as in most parts of the Continent, both as to the yield per acre and the sugar content. In due course, no doubt, Sugar Beet will be largely and successfully cultivated in England, but the matter is not one to be treated hurriedly as a war emergency question. It is not such a simple matter as some people suppose to persuade farmers to grow the large quantities of Beet required. The chief difficulty of the Cantley factory, which has been often referred to in these debates, lay in securing a regular supply of Beet sufficient to keep the machinery running economically within about 2s. per ton rail way or water distance of the factory. The most economical unit seems to be a factory of 80,000 to 100,000 tons annual capacity. This means an area under Beet of 8,000 to 10,000 acres per annum. On a four-course rotation 32,000 to 40,000 acres of arable land worked in turn would, therefore, be required to maintain a regular supply to a single factory, and these figures assume that the whole root crop of the farm consists of Beet, which in practice would not be the case.

WOMEN'S FARM AND GARDEN UNION.—During the past year 106 new members have joined the Women's Farm and Garden Union. The Union was reconstructed in the spring of 1915, and this led to recognition and financial help by the Government. To meet the great demand for women gardeners and hailiffs, short courses of training have been instituted. This no doubt is one of the necessities of the times, but if women expect to be successful either as gardeners or hailiffs after the war, when competition will be keener, they must be prepared to undergo fuller preliminary training.

BLUEBERRY CULTURE. Blueberry culture is developing into an industry of some importance in the United States, and Mr. CORRIE, Government Botanist, has published several papers on the subject. The present one is an illustrated epitome of what has been accomplished so far. The name Blueberry is applied in the United States to more than one species of *Vaccinium*, though more especially to *V. corymbosum*, which is nearly allied to our native *V. Myrtillus*, the Bilberry or Whortleberry. Success in Blueberry culture, CORRIE maintains, rests largely upon the recognition that an acid soil is essential and the presence of a root fungus, which appears to have the beneficial function of supplying nitrogen to the plant. Full details of cultivation are given; also of propagation and treatment. An example is given of the yield and profits of a plantation 2½ acres in extent. This plantation was started in 1883, but exact records of yield and receipts are only available for the years 1910 to 1915. The average yearly yield in quarts for the six years was 1,741 per acre, the lowest being 419 quarts and the highest 2,574. The average price obtained was 14s. 6c., and

average profits \$116 (about £25) per acre, after making all necessary deductions. But the author explains that the plantation was composed of wild bushes taken indiscriminately, and he fairly contends that selection would give better results, and much might be expected from new varieties artificially raised. In support of this he gives illustrations of cross-bred new varieties which fully bear out his predictions, though they have not been tried on a sufficiently large scale to give convincing results. Promising results have been obtained by crossing Low Bush Blueberry (*Vaccinium angustifolium*) with High Bush Blueberry (*V. corymbosum*). The Blueberry will flourish in a soil in which few other plants will grow.

SAVING TREES IN THE BATTLE AREA.—The destruction of French fruit trees by the retreating Germans who cut down thousands of valuable trees before retreating back according to plan will probably not be quite so serious as at first expected. Mr. HENRY WOOD, the Special Correspondent of the United Press of America with the French Armies, gives an exceedingly interesting account of how the French set to work to rescue as many as possible of these ruined trees. As soon as the

side. This last operation, performed with the pain-staking care which characterises French gardening, is much more certain of success than the treatment of the "ring trees," and several years, at least, have been saved in restoring a portion of the mutilated orchards of France, for at present the labour needed for replanting such extensive areas would be prohibitive. But a few orchards have been planted, and Mr. WOOD describes "the carefully cultivated and planted fields, each bearing its little painted sign, 'Terre cultivée par l'Armée.'" Army wagon and ammunition cart-horses, not otherwise wanted for the moment, are pressed into the service of ploughing, cultivating, and harrowing alongside the camps, and as one body of troops proceeds to the front, the work is continued by the successors.

WAR HORTICULTURAL RELIEF FUND.—Lady SPENCERINA has given £100 to the Royal Horticultural Society's Allies' War Relief Fund, which has been started for restoring the ruined gardens and gardening industries of our Allies.

DUTCH SEED FIRM'S JUBILEE. The fiftieth anniversary of the foundation of the firm STALS AND GROOT, seed merchants, Enkhuizen, Hol-

recaptured areas were consolidated, the orchards were inspected by experts, and it was found that more recently time did not apparently permit the Germans to follow their earlier practice of felling the trees, and that they had contented themselves with removing rings of bark, expecting that this would be sufficient to destroy the trees. Assisted by many Army surgeons and other Red Cross workers, the tree experts had first covered with a special grafting cement, and the entire wound then carefully bandaged up—often with bandages that had been prepared for human limbs. So great was the number of trees that had to be dressed in this way that the entire available supply of grafting preparation was quickly exhausted. Tar was then used as a substitute, and finally even a loamy clay. Substitutes for surgical bandages also had to be found, and in the end it was discovered that moss twisted and tied about the dressed wound was as effective as anything else. The trees thus treated were chiefly half a century-old Peaches, Plums, Apricots, Apples, and Cherries. Even the trees which had been felled have also received attention. The jagged stumps, usually two to four feet long, have been cut cleanly and then grafted, in many cases, with their own shoots taken from the branches lying by their

side. The occasion was celebrated on the 3rd inst. The founders of the business, Mr. N. STALS and Mr. N. GROOT, who are respectively 83 and 75 years of age, were presented with their portraits in oil colours to mark the occasion.

CANTUA BUXIFOLIA.

CANTUA BUXIFOLIA is one of the most beautiful of greenhouse climbers, and has been cultivated in this country for many years, although it has

never become common. It is extremely suitable for furnishing a greenhouse pillar or corridor wall. Especial attention may be called to it, now that indifference to indoor plants is certainly increasing. So much are they now neglected that

it is difficult to know where some of the choicest can be obtained. *Cantua buxifolia* was introduced by Messrs. R. Veitch and Son, Exeter, many years ago, and was said there to have withstood two winters in the open. The plant is not

FIG. 3.—CANTUA BUXIFOLIA (DEPENDENS). FLOWERS BRIGHT ROSE-PINK.

difficult of cultivation, but it should be grown in peaty soil, and needs a fairly cool, moist atmosphere. Red spider is its greatest enemy, but, with ordinary care, this pest can be overcome by any of the usual remedies. Cuttings root without difficulty. The plant is a native of Peru, and the Peruvian Indians are said to adorn their chambers on feast-days with the gay blossoms. The species is figured in the *Botanical Magazine*, tab. 4,582, and is there described as a very ornamental flowering shrub. It belongs to the natural order Polemoniaceae, and has dependent, tubular flowers (see fig. 8). The limb of the corolla is deep pink, and the tube pale pink or nearly white. *R. Irwin Lynch.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

TRANSIT OF FRUIT AND VEGETABLES.—The attention of the President and Council of the Royal Horticultural Society having been called to the difficulty fruit growers and market gardeners were experiencing in the matter of railway transport, and the prospect of that difficulty increasing through varying causes, including the shortage of baskets, a letter on this subject was recently sent by the Society to the Railway Executive Committee, to which the following favourable reply has been received:—"In reply to your letter of the 16th inst. calling attention to the shortage of receptacles, in which fruit and vegetables are sent, which must occur unless priority treatment is given to the return of such empties, this subject is one to which the railway companies have given careful consideration, and instructions have been given to their staffs concerned with a view to ensuring the prompt return of fruit and vegetable packages." *W. H. D. Society, Royal Horticultural Society.*

SEED-GROWING. Should not other foods than Corn be produced, both for man and beast? And if so, is the production of selected seeds from which foods are to be grown as important as, or even more important than, the production of these foods for immediate consumption? The sowing of vegetable and root seeds this spring will have taken nearly all the seeds in the hands of seedsmen, both retail and wholesale. We in this country, do not, even in normal times, produce as many seeds as are required, but growers abroad can now only in rare instances arrange for any seed crops, owing to mobilisation, and also because those seeds which they are able to grow will be required largely for home sowing. In England it is almost as bad. My firm has heard almost daily this spring from seed growers that they cannot possibly undertake contracts as usual, owing to their men having been all or nearly all taken. And now, in the nation's slow, blind groping, before the real truth has been found, new and unforeseen difficulties arise. For example, since the people in authority have not answered the questions which I venture to put in my first paragraph in the only way in which they ought to be answered, War Agricultural Committees have been employing themselves, in some seed-growing areas, in restricting the growing of seeds other than Corn. It is not genuine to the subject matter of my letter, but may I say that equally with the "authorities" the lay public requires expert advice? For instance, no one should imagine that such suggestions as "Grow Haricot Beans" and "Cultivate Sugar Beet to sweeten jam" point to the *summa bonum* of national effort in the garden or on the farm in this land, when land and labour are valuable. Hobbies in this country may be made to give a sound crop of seed in southern counties one year in five; but Sugar Beet, whatever its other qualities, will not crystallise out as preserving sugar in the twinkling of a human eye. *James Kolway.*

INSECTS AND BIRDS. (See pp. 255, 264). Birds are a great limiting factor as regards insect pests, but I do not think that the anti-sparrow campaign can be held responsible, to my marked degree, for the plagues of caterpillars that have appeared in various districts this year.

C. X.'s theory, showing how a severe winter favourable to insect life, seems to me an excellent one; but another reason why insect pests are more numerous this year is that the lack of labour owing to the war has prevented orchardists from receiving the careful attention that they would have had in normal times. In my opinion, so much attention cannot be paid to the ground beneath the trees. I have found it extremely beneficial to fork the soil frequently to a depth of four or five inches. In this way the pupae of numerous harmful insects are laid bare to the attacks of birds, particularly robins. Much good is also derived from encouraging tits to breed in orchards by providing suitable nest-boxes. I may add that my trees are much cleaner than they were last year, although sparrows are by no means abundant here; that they are in most localities. With regard to the old belief that severe winters kill off injurious insects, the explanation may lie in the fact that usually plants grow much better after a severe winter, because during such a season the plant foods, chiefly nitrates, formed by the action of soil bacteria during the spring, summer, and autumn are not washed out of the soil. In addition, hard and continuous frost destroys many organisms which are enemies of the useful

plexicaulis, *Delphinium Brunnatum*, the dwarf form of *Potamogeton obtusum* called *luteus* cause a very dark form of *Campanula anabasis*, and a well fruited shoot of the so-far unnamed *Lomera F. 269*, collected by Mr. Farrer in Kansas.

Obituary.

PHILIPPE DE VILMORIN.—It is with the deepest regret that we announce the death, on the 30th ult., after a short illness, of Monsieur Philippe de Vilmorin, head of the French nursery firm, Vilmorin, Andreux et Cie. Monsieur Vilmorin was only forty-five years of age, but had already attracted to himself a wide circle of friends and admirers. His funeral, which took place at Verrières-le-Buisson, the home of the Vilmorin family, on the 3rd inst., was attended by representatives of the President of the French Republic, of the Ministries of Marine and Agriculture, of the Treasury, and of the many scientific societies of which Monsieur de Vilmorin was an honoured and valued member. His early death removes one of the most promising and distinguished figures from the ranks of horticulturists. His keen intellect, general love of horticulture, and energetic enterprise in applying science to that art, had already gained for him a leading position among the horticulturists of the world. To few men is it given to evoke in equal degree both admiration and affection, sentiments which were universally felt for Monsieur de Vilmorin, not only in his own country, but in this. Although he retained the marked and admirable qualities of his race, he had the gift of making everyone feel at home with him. Tall and handsome, speaking English with remarkable facility, he will be deeply mourned by his English colleagues, who recognise that his death is a loss not only to his relatives and friends, but also to the two allied nations, France and England. He leaves a widow and six children, to whom we tender our deepest sympathies.

THE LATE MONSIEUR PHILIPPE DE VILMORIN.
